Mr. MALARKEY. It varies from system to system. There are some contracts that are cancelable by either party on 30 or 60 days' notice.

There are contracts that provide guaranteed service for a year, and there are some for 2 years. There are 1 or 2 that I know of for 3 years.

Senator BIBLE. And what type of enforcement problems do you run into in cancellation of contracts? If they don't pay the bill, you cut off the service—is that correct?

Mr. MALARKEY. Yes, sir.

Senator BIBLE. And you say you represent 200 operating companies. Are they all in active operation today?

Mr. MALARKEY. Yes, sir, they are all in active operation today.

Senator BIBLE. What has been their pattern of success? I mean, are they successful? The reason I ask the question is this: We have a community antenna in Reno. It is competitive, of course, with one live station there, and I have heard rumblings constantly that the community antenna system is on shaky ground, or that they are about to go out of business. I don't know how accurate that is. I am wondering what your experience has been. When you named the highest cost for installation, as well as the highest monthly cost, I think you are referring to my hometown, because I think that is true of Reno, Nev. I am wondering what the experience has been.

Mr. MALARKEY. It is a coincidence that you happened to mention Reno. Reno is one of the very few unsuccessful systems in operation in the country today.

Senator BIBLE. It is a coincidence I happen to be the chairman when it comes up.

Mr. MALARKEY. There are very, very few community systems who haven't been able to deliver a needed service and have had to, for one reason or another, cease and desist operation. They have all continued to grow, even in those areas where there are 2 or 3 signals available from the local stations.

Senator BIBLE. That is why I was asking earlier as to how many homes you had to have to sustain a community antenna. It may be the cost of bringing this from the high Sierra Mountains down to Reno. It may be due to the microwave.

Mr. MALARKEY. Yes, sir.

Senator BIBLE. Reno is, today, a community of 50,000 people. So it baffles me that they are having such great difficulties in making it financially sound.

Mr. MALARKEY. Well, if I might express a personal opinion, the Reno problem could be solved if microwave facilities were available to bring into Mountain Slide the signals from the originating stations, so that they could be microwaved down into the community. The problem in Reno has been one of poor original signal receiving up in Mountain Slide. I have been up there.

Mr. COX. Could you tell us what percentage of these community antenna systems are cooperative and what percentage is commercial, roughly?

Mr. MALARKEY. We don't have figures to support what I am going to say, but it is my impression that the greater majority of the systems in operation are commercial systems.

Mr. COX. All of the larger systems?

Mr. MALARKEY. All of the larger systems are commercially operated systems.

Senator BIBLE. I don't know that I got a direct answer to my question. My understanding is that the 200 operating companies that are in existence today are original companies and have stayed in existence throughout the period of development of the industry.

Mr. MALARKEY. There are 200 operating companies which are members of our association. There are 450 or 465 operating companies.

Senator BIBLE. I had reference to the 200 operating companies of which your association was the representative.

Mr. MALARKEY. You are asking whether they are all operating companies today?

Senator BIBLE. Yes, and are they in existence today.

Mr. SMITH. Yes, sir.

Mr. MALARKEY. Yes, sir; 195 or 196 of them are companies that are in operation today. The other 3 or 4 companies are companies who are just developing their antenna and building their transmission lines and are in the process of going into the business.

Senator BIBLE. So your statement is that where you do start community antenna systems, that with very, very few exceptions, they stay in business; is that a correct statement?

Mr. MALARKEY. That has been our experience.

Senator BIBLE. There are just a few isolated instances where they have had financial reverses?

Mr. MALARKEY. Yes, sir.

Mr. COX. Have any of them actually ceased service, do you know?

Mr. MALARKEY. One that I know of, in Maine.

Senator BIBLE. I think that is fine, Mr. Malarkey.

It is my understanding that we have one more witness and that he has asked that he be given just a little more additional time to put his statement in final form. With that in mind we will stand in recess until 2:15.

(Whereupon, at 12:07 p. m., a recess was taken to 2:15 p. m. of the same day.)

AFTERNOON SESSION

Present: Senators Magnuson (presiding), Duff, Thurmond.

The CHAIRMAN. The committee will be in order.

Our first witness this afternoon is Mr. Milton J. Shapp, president of Jerrold Electronics Corp.

You may proceed, Mr. Shapp.

STATEMENT OF MILTON SHAPP, PRESIDENT OF JERROLD ELECTRONICS CORP., PHILADELPHIA, PA.

Mr. SHAPP. Mr. Chairman, members of the committee, I am Milton J. Shapp, president of Jerrold Electronics Corp., of Philadelphia. Pa. I am here this afternoon to outline the details of a new plan that will speed the extension of television service to every town of over 1,000 population in the United States. If the Federal Communications Commission approves a proposal that we will file with them on Monday, there is no technical nor economic reason why multichannel television service cannot be made available to every such community in the United States before the end of this calendar year.

Jerrold is prepared today to furnish multichannel service to any of the communities in the Northwest States presently served by unauthorized reradiators. We have done sufficient engineering already to quote specific prices for providing three-channel service to Bridgeport and Quincy, Wash., with construction to start immediately. We are prepared to undertake projects for bringing television to any of the almost 600 communities shown on this map [indicating]—communities that today are virtually devoid of television reception. Over 5 million Americans live in television-starved areas—2 million of them in these 600 towns.

Gentlemen, the plan I shall present to you this afternoon is not nebulous. It is quite specific. We are prepared to quote prices on equipment already in production and to undertake installation of systems anywhere within the United States. This new Jerrold plan (that has been dubbed by our engineers as the "Peashooter") is in our opinion the real answer to providing multichannel television coverage to all of the present blacked-out areas in the United States; television of a high order of quality and consistency at a price well within the reach of the citizens who live in these communities.

First, let me give you a brief background of the Jerrold organization, and a brief description of our experience in the field of bringing television to remote areas. Ever since our company was founded in 1948, our primary business has been to make television reception possible in fringe and isolated areas of the country. In 1948 and 1949, we produced television boosters for individual set owners. In 1950, we pioneered the development of community antenna systems. In the past 5 years, our company has equipped more than 300 cities and towns throughout the United States with community antenna systems. We are the leading manufacturer in the community antenna industry today—an industry that serves approximately 1,500,000 citizens with television reception.

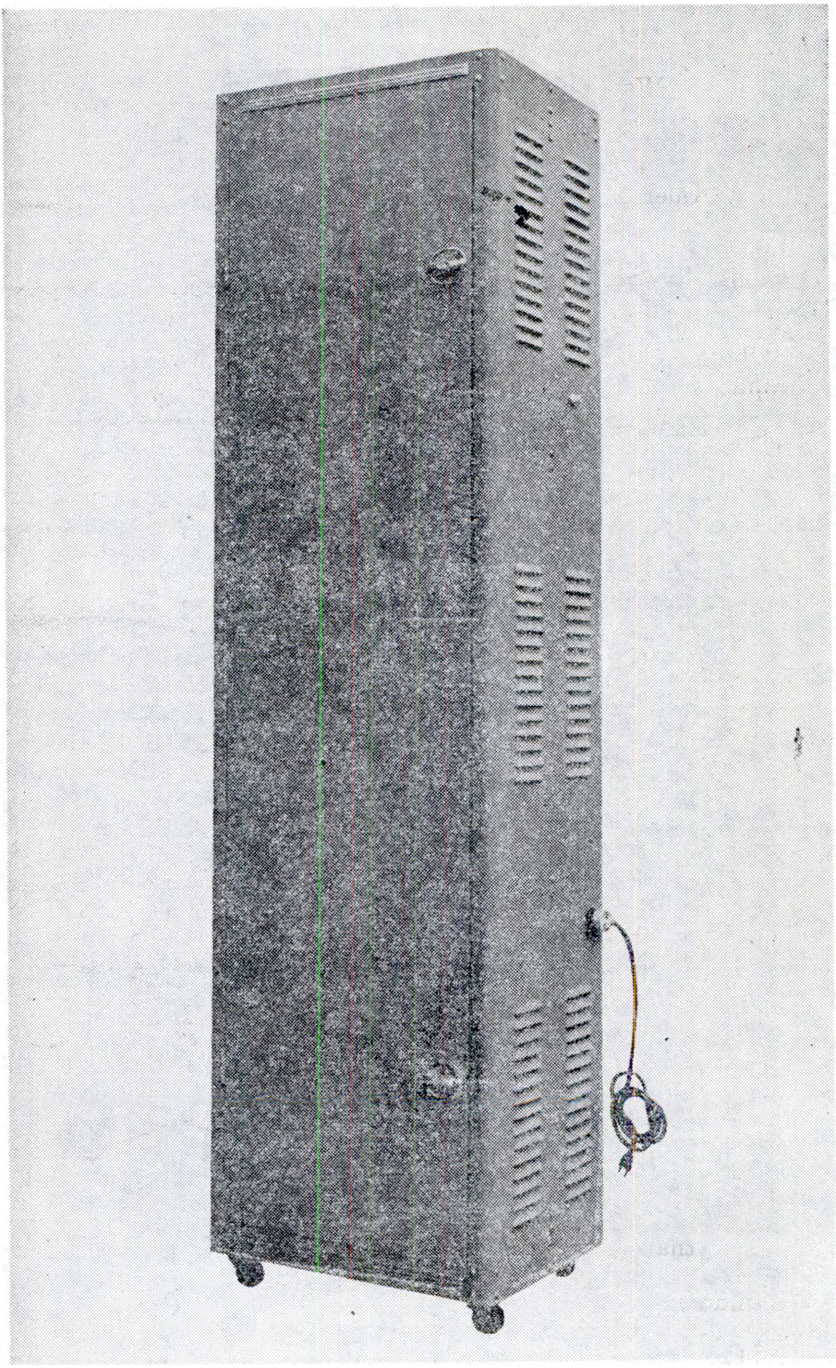
During the past 3 years, we have designed, manufactured, and installed a fairly substantial number of satellites and translators in the Latin and South American countries. Our engineers are at this very moment completing the installation of six translators in Venezuela.

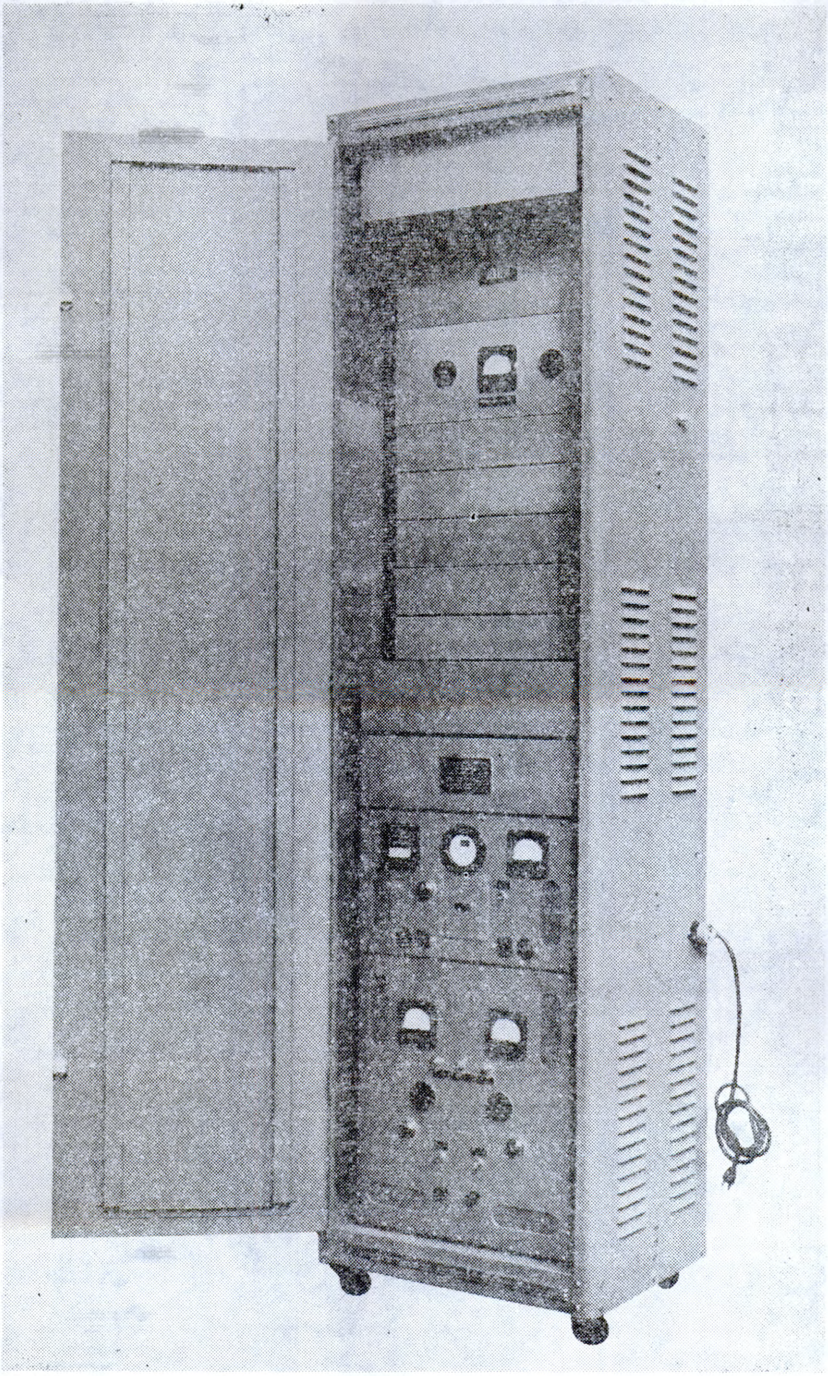
I have here, as exhibits for the committee, some photographs[1] of the translator equipment we are installing in Venezuela right now. I cite this to show that our basic work, Senator, is in the field of bringing television to remote areas by whatever means is the most practical, by community systems, by satellite, or whatever means is the most economic and technically the most feasible for the given area.

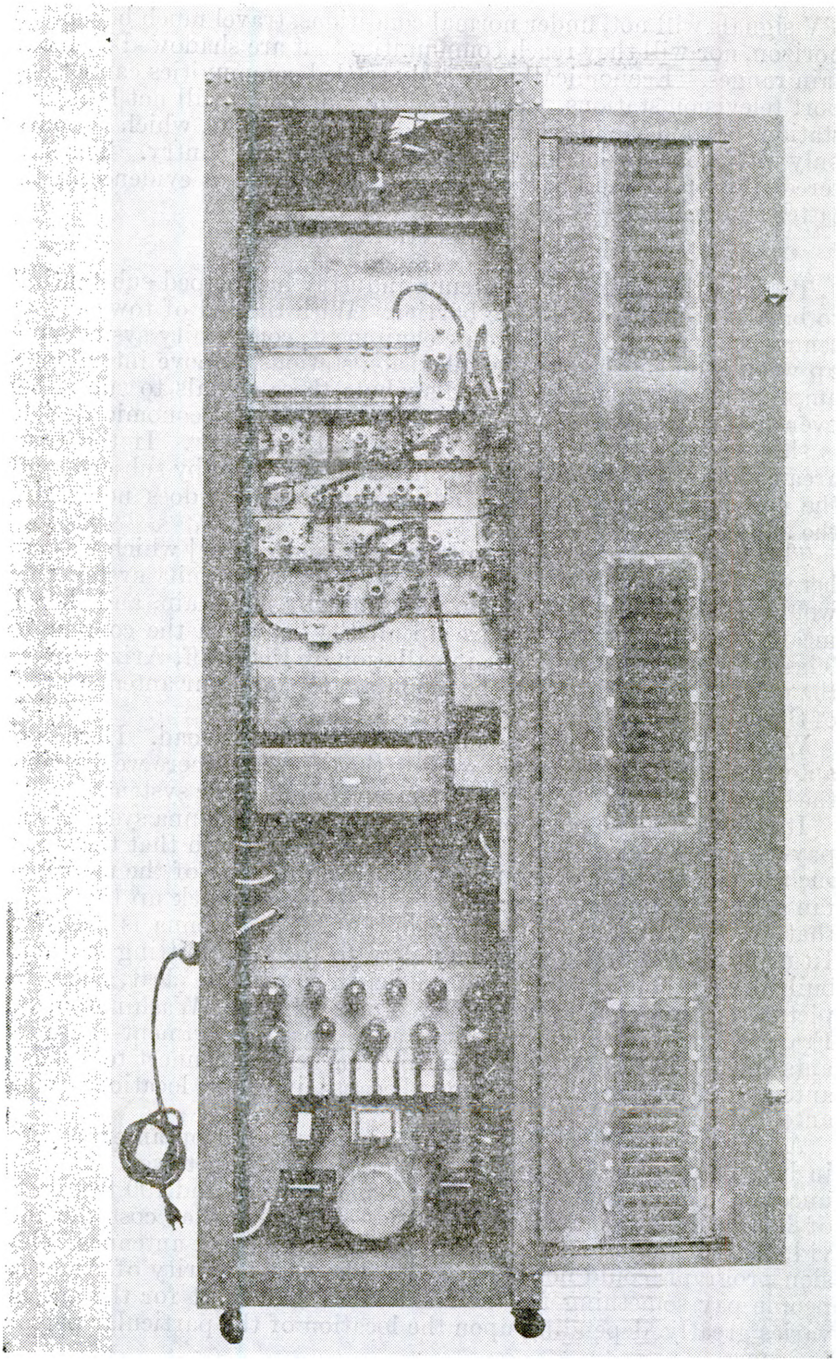
Our company has probably done more research, study, and development on the problems of extending television coverage to remote fringe areas than any other single company in the United States. The "Peashooter" plan which we have developed for extending television coverage to all communities in the United States is based upon the experience that our organization has gained in this highly specialized industry.

To understand the nature of the Jerrold proposals, it is necessary first to understand the technical and economic factors that have prevented the spread of television into the small isolated and fringe areas.

[1] The photographs referred to are reproduced on the following pages.







The limits of television reception are both technological and economic. TV signals will not, under normal conditions, travel much beyond the horizon, nor will they reach communities that are shadowed by mountain ranges. Economically, sparsely settled communities cannot support television stations. Television entrepreneurs will not build new stations beyond the horizon of the advertising dollar, which is poured only into the more densely populated areas of the country. The shattered illusion of the UHF allocation program bears evidence of this latter statement.

COMMUNITY ANTENNA SYSTEMS

To date, the community antenna industry has helped substantially to break through this double barrier. With the aid of towering antennas and specialized electronic equipment, community systems pick up weak signals broadcast by television stations, remove interference, amplify the signals, and then distribute these signals to subscribers over coaxial cable systems. By this method, the economic decision is shifted from the advertiser to the final consumer. If the fringe area citizen wants television, it is his choice to do so by subscribing to the community system. The advertiser generally does not sustain the added costs.

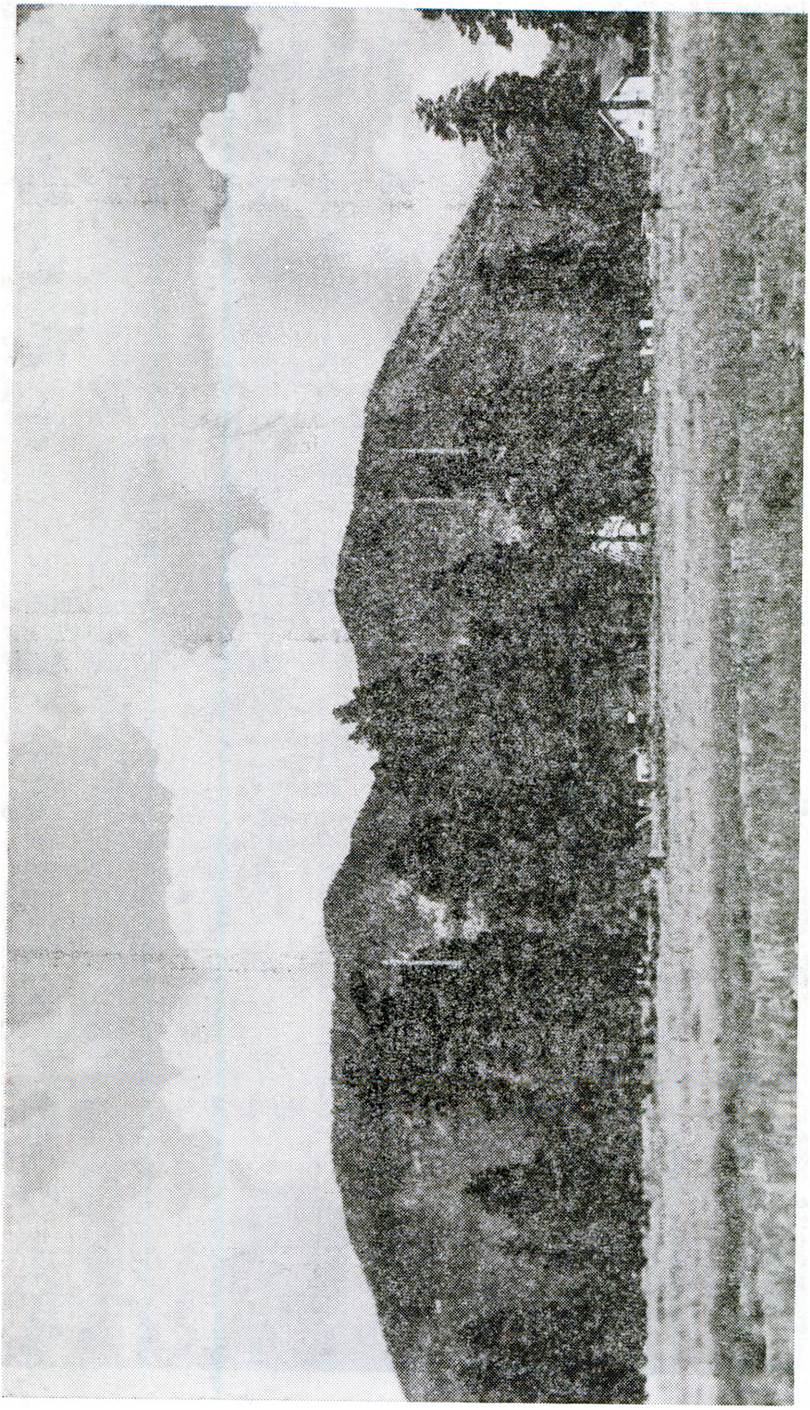
This is a model of a community system [indicating] which was used here this morning. Generally in the average community system there would be an antenna site on top of a nearby mountain, and then by means of cable we would wire up all the homes in the community. These photographs show our installation at Flagstaff, Ariz. This is the mountain at Flagstaff—the mountain top, and our antenna on top of the mountain.

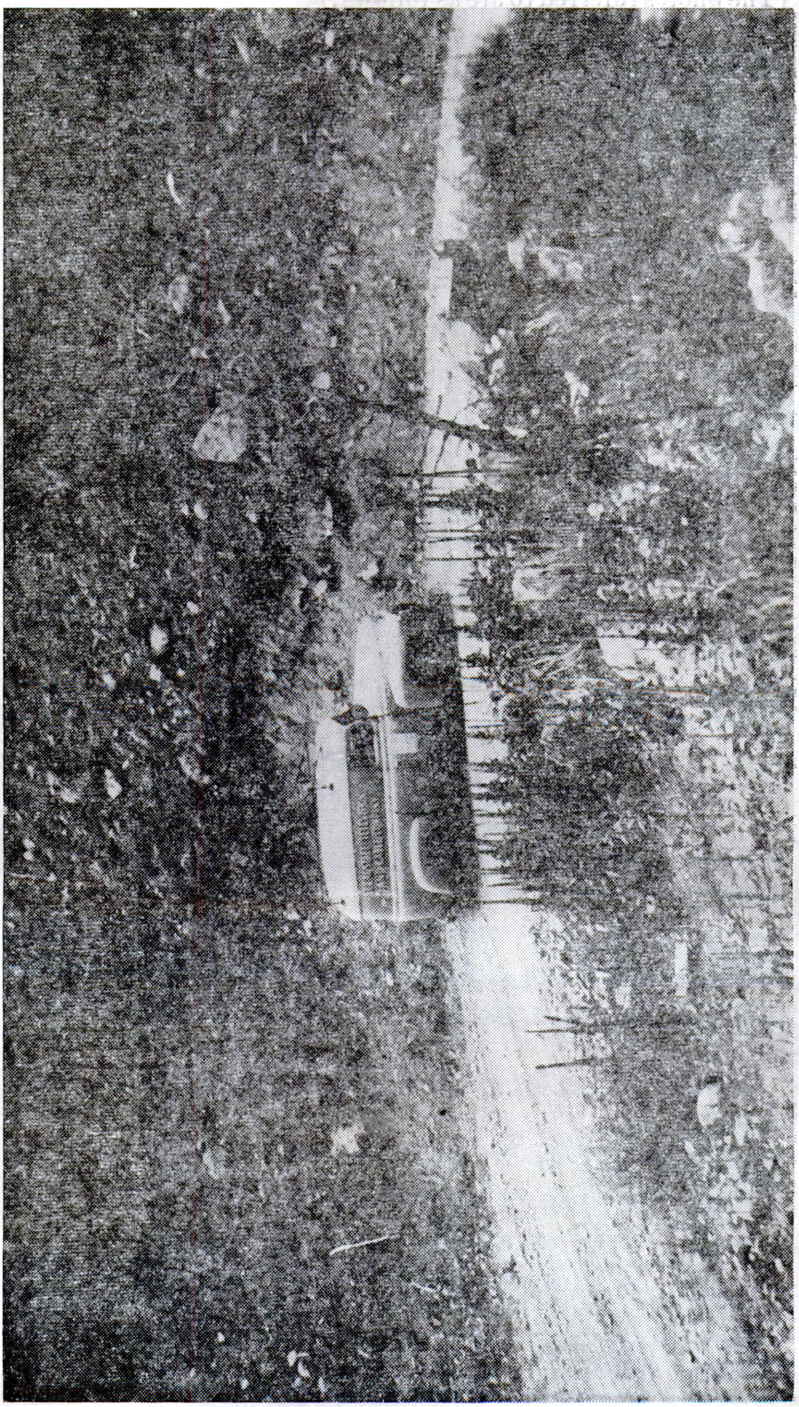
We run by cable down this mountain along this road. Here is the antenna at the top. It goes down into the town, and there we distribute the signals into the community by means of our cable system.

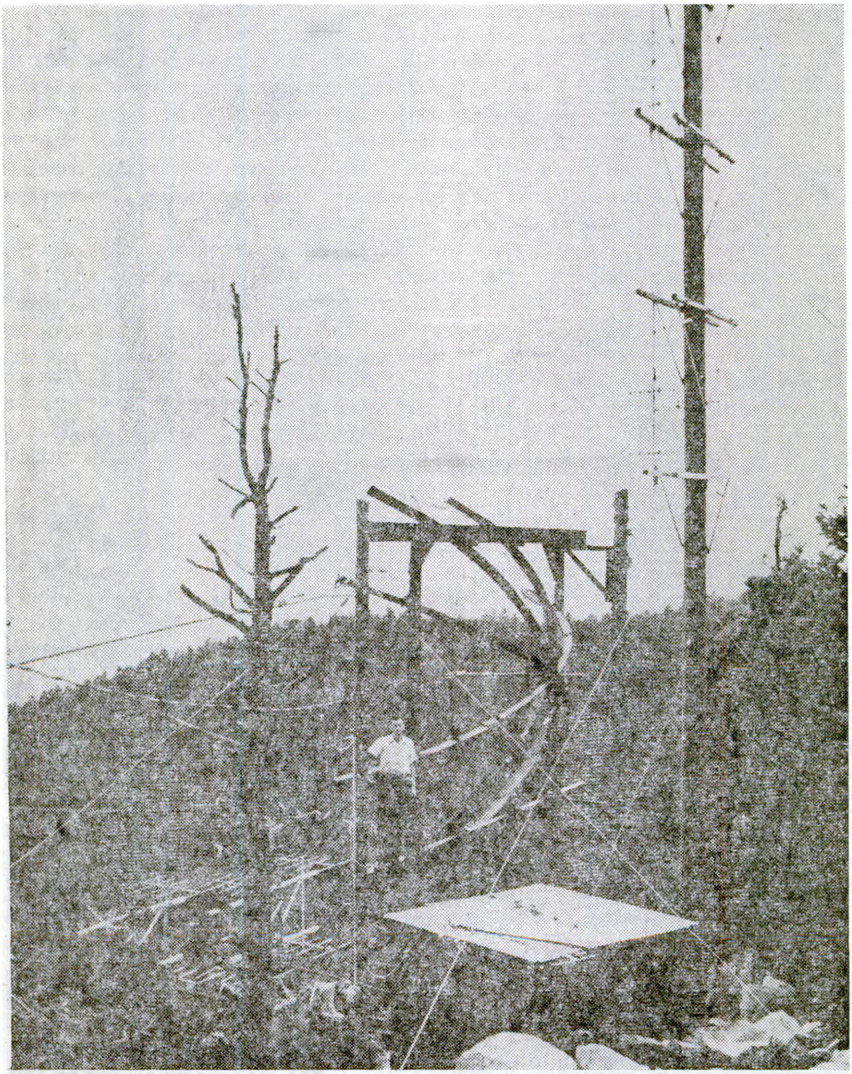
It is important to point out that a community antenna system is not pay-as-you-see television. It is an unfortunate truth that theer is no such thing as free television reception, even in most of the metropolitan areas. A television receiver by itself cannot pick up the signals that are broadcast from the transmitters. An antenna is necessary. In many homes and apartments close to the transmitting station, a built-in or rabbit-ear antenna is sufficient to provide clear, ghost-free pictures. However, even in New York, Chicago, Washington, San Francisco, and other metropolitan areas, many apartment-house tenants spend $50 to $75 (plus monthly charges) to connect to a master antenna system in the building, because in these locations indoor antennas do not suffice.

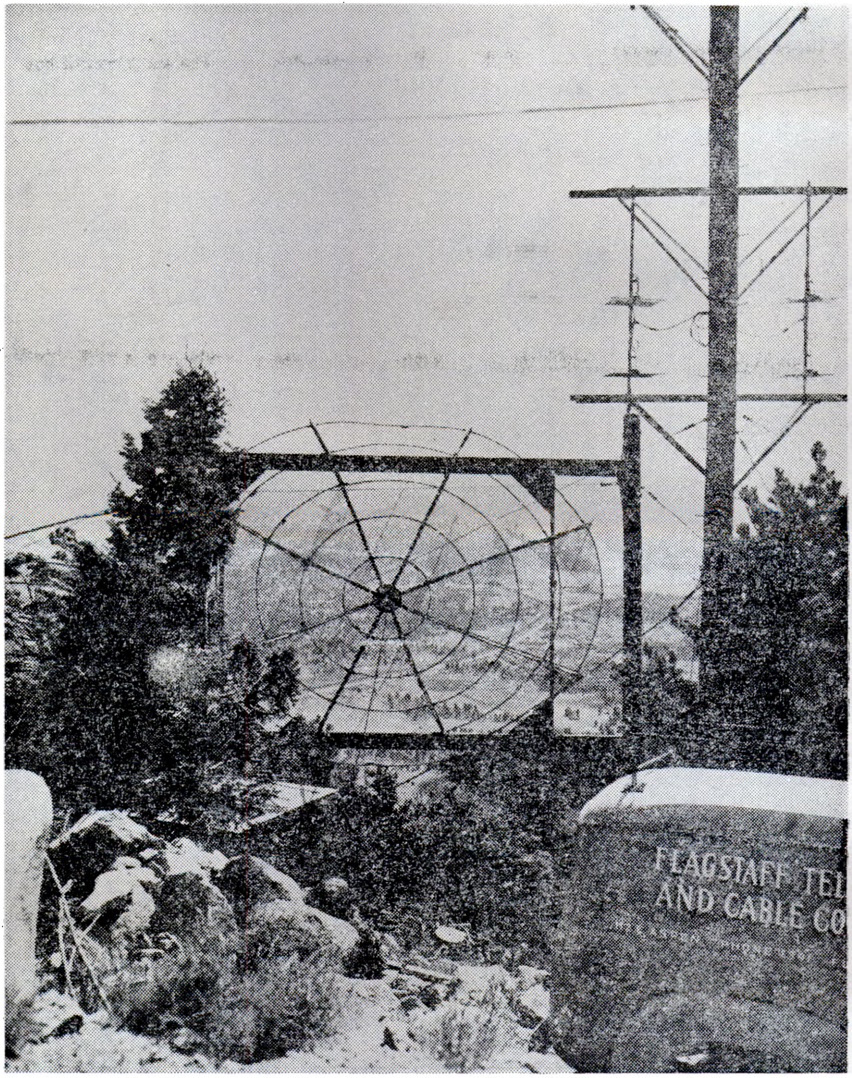
As one travels away from the transmitters, rooftop antennas grow in height with the distance from the transmitting tower. It is not uncommon at all to find antenna towers of 50 feet and 100 feet on top of homes in fringe-area communities—antennas that cost the individuals from $100 to $300. Without these high-cost antennas, television programs could not be viewed. The vast majority of American people pay something for their antennas. The cost for the antenna varies greatly, depending upon the location of the particular person's residence.

(The photos referred to are as follows:)



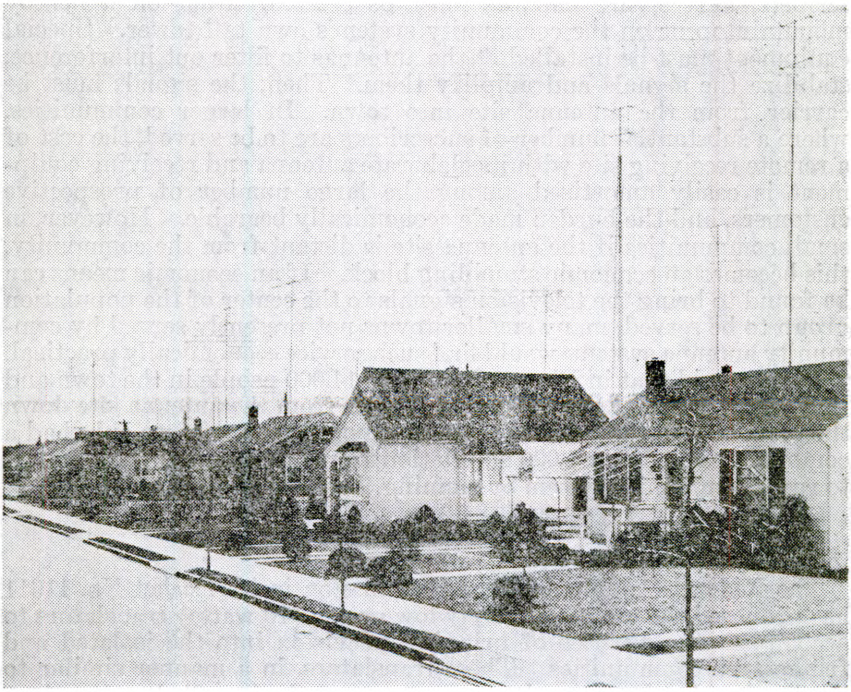






FLAGSTAFF TEL
AND CABLE CO

I have here some photographs of a fringe area community that show the antennas in some of these towns where the people have paid from $75 to $150 or $300 for their individual towers. I might add that



in that particular town—which is Ventnor, N. J.—we have a community antenna system, and people are taking these towers down to connect to the system rather than have an individual tower in their home. They get better pictures and the cost is lower.

A community antenna is, as its name implies, an antenna that is shared by a community. Instead of everybody in town putting up their own towers of 300 feet, 400 feet or 500 feet, as would be necessary in the flatlands of Texas or Mississippi to receive programs, or instead of everyone putting an antenna on top of the nearest mountain and running his own lead-in from that site to his receiver, 1 giant tower or 1 antenna is erected, with resultant economies.

Each person who desires to receive television then pays a connection charge and a monthly maintenance fee to the owner or operator of this community antenna. In this manner, the consumer attains far better television reception at a lower cost than he would obtain in that community by installing his own antenna. In most cases to date, the installation of community antenna systems has been privately financed and the companies are operated to produce a profit. In a number of cases, the systems are cooperatively owned, and since the capital expenditure and risk is shared by the viewers, and since these cooperatives are normally operated on a no-profit basis, the connection and monthly rates may be somewhat lower.

As I shall show later, these rates can be as low as $74 a connection and $2 a month for many of the cities in the Northwest area.

However, community systems, too, face an economic barrier. Regardless of the density of population or the number of potential subscribers, a receiving antenna must be erected, either on a nearby mountaintop or on the community system's own tall tower. Special equipment must be installed at the antennas to filter out interference, stabilize the signals and amplify them. Then, the signals must be carrier from the antenna site into town. In larger communities, where a substantial number of subscribers are to be served, the cost of a remote receiving site with its elaborate antenna and receiving equipment is easily amortized among the large number of prospective customers, and the burden made economically bearable. However, in small communities if the antenna site is distant from the community, this becomes an economic stumbling block. If an economic means can be found to bring the television signals to the center of the population group to be served, many smaller towns not presently served by community antenna systems would find such service economically practical.

I might add that in Flagstaff we have 14,000 people in the town and they could afford to run this cable 7 miles from the antenna site down the mountain to the town to serve that population. If we only had a community of 3,000 or 4,000 population there, it would be uneconomical to run a community system by running the cable off the mountain.

TRANSLATORS

The Federal Communications Commission in its Docket No. 11611 has proposed the use of relatively low power (10 watts) translators to accomplish the purpose of bringing television into the isolated and fringe area communities. These translators, in a manner similar to the head-ends of community systems, are to be installed at locations where broadcast television signals can be received. Instead of bringing these signals to town and distributing them through the community by means of cable, it is proposed that the translator simply rebroadcast the programs picked up, utilizing the now unused top 14 UHF frequencies for this purpose.

Whereas the translator will find application in some communities, it is not a cure-all for the small community problem. Its use has economic and technical limitations. The proposed translator has all the costs usually associated with the receiving site or head-end equipment for a community system. These costs are determined by the nature of the signal reception and have little to do with what is done with the signal thereafter. Therefore, it is important to understand that the UHF transmitter portion of the proposed translator merely replaces the transportation system necessary to get the television signals from the receiving site to the population area to be served.

Most descriptions of the proposed translator system assume that the cost of the system ends at this point. However, this is not the case. The individual set owner is still faced with the cost of installing and maintaining a good UHF antenna and a converter for his own television receiver. Of necessity, the total cost of installation and operation of most translators must be supported by their viewers.

Arranging the economic support of the proposed translators is by no means as straightforward as in the case of a wired community system. In a cable system only those who subscribe to the service and thus pay their share of the cost are able to obtain television reception. With the translator, a signal is broadcast toward a population area and anyone who provides himself with the proper UHF receiving equipment can receive the signals. In many of the communities in the northwest section of the United States, where unauthorized reradiators have been in operation, various arrangements have been made to divide the cost of operating the transmitter equipment among the viewers. These arrangements have taken the form of some civic action, but there are many accounts in the newspapers to indicate the difficulties of obtaining a truly cooperative program. Unauthorized reradiators have had to be shut down by their operators for periods of time in order to "pass the collection hat" around the community in order to obtain operating funds. There are within any group, those individuals who are willing to "let George pay it." The financial problems of installing and operating a translator service, with costs much higher than the unauthorized reradiators, may well prove to be a very difficult community problem to resolve.

Technically, the translators may provide good service in some types of communities. Bridgeport, Wash., is typical of a community which, in our opinion, can be best served by this means. The community is close to the signal receiving point. I might add that in Bridgeport there are some 270 to 280 homes spread out over about 8 miles of the city, so that the density is slightly over 30 homes per mile, which makes cabling in the town rather expensive per residence unit. That is why we say that Bridgeport is typical of a community which can best be served by translators.

The CHAIRMAN. You have an unusual situation in Bridgeport, because we are building a huge dam there and when the dam is finished then there is going to be a rearrangement of their economic factors, which might then make it good for cabling.

Mr. SHAPP. Yes.

However, because of the very nature of UHF frequencies, there will be many communities that cannot be covered properly by the proposed translators. People living behind hills or large buildings within the community may find themselves shadowed and unable to receive the translator signals. Furthermore, because of the low power transmitted and because of the relative inefficiency of UHF tuners and converters at the high frequency—top 14 channels—of the UHF band, the area of coverage for reliable reception will be limited. Further, due to the more rapid failing in efficiency of tubes at the higher frequencies, the service cost of maintaining snow-free reception at these frequencies will be higher than normally experienced in other UHF areas.

From an economic standpoint, it appears that the cost of installing a UHF antenna and converter to receive signals from a translator will be no less than $70 per home. In many cases, because of low signals or because of terrain features, this cost may be higher. In addition, each individual will be asked to bear his share of the cost of the translator itself.

As in the case of the unauthorized booster, in my opinion it is doubtful that any translator equipment will be placed on the market in the near future that will sell for much less than $2,000 a channel. This price does not include the engineering surveys, nor does it include the cost of installation. It does not include the cost for many specialized filters or other equipment that may be necessary in many areas in order to obtain clear, interference-free pictures. It does not include housing shelter for the equipment, nor does it include the cost for running power up to the proposed transmitter site. Based upon the experience of our company in installing front-end equipment at antenna sites in over 300 community antenna systems, it is doubtful if any translators can be installed to provide 3 channels into a community—the minimum service furnished by most community antenna systems today—for less than $10,000. In many cases the cost will be greater.

I might add that in the case of some of the northwest cities this can be reduced because they have had power run up to the antenna sites; they do have shacks and some buildings, so that equipment can be utilized for installation of translators.

When the $70 cost per individual receiver is added to the share of the cost for the installation of translators that must be borne by each subscriber, it becomes fairly obvious that the translator proposal in itself will not bring "free," or even low cost, TV reception to small communities.

I just point out at this time that these communities, in that respect then, are no different than remote fringe area communities in other sections of the country who have to install their own big antennas, and so forth.

THE JERROLD PEASHOOTER PLAN

However, there are features of the proposed translators which, if combined with community antenna systems, would offer a very practical solution to the problem of bringing television to the majority of small, isolated communities on a more economical basis. As stated previously, the main barrier to community antenna systems is the cost of bringing the signals from the mountain top to the town by means of cable. Further, as stated above, the chief advantage of the translator is that it offers a rather economical method of conveying the signals from the mountain top to the community.

Jerrold proposes that the Federal Communications Commission consider a combination of the translator service and a modified type of wired community service as a means of bringing television to the fringe area communities. Jerrold is filing such a proposal with the Federal Communications Commission, and we have asked for an experimental license to test and demonstrate immediately the feasibility of this proposal in Ellenburg, Wash.

The CHAIRMAN. What authority does the FCC have to give you to do this?

Mr. SHAPP. We are asking to use the top 14 UHF frequencies, such as is proposed in their translator service, for this point-to-point type of service from our mountain top into town, with these signals.

The CHAIRMAN. Through a cable?

Mr. SHAPP. No; through the air.

The CHAIRMAN. Why do you have to ask the Communications Commission for that authority?

Mr. SHAPP. Because these frequencies have been assigned, at the present time, for broadcast purposes, and we do not have the authority to just go ahead and use those frequencies.

The CHAIRMAN. So what you are asking, then, is to use frequencies in this particular case, say in Ellensburg, that are not being used anyway?

Mr. SHAPP. That is correct, sir. Back here by the airport [indicating on model] we have a horn up on top of the mountain. Here is our receiving horn in Ellensburg. We would propose that the antenna site beam the signal through the air right down here.

The CHAIRMAN. That would use only one frequency?

Mr. SHAPP. We would have three channels.

The CHAIRMAN. Three channels coming off there down here?

Mr. SHAPP. Yes.

The CHAIRMAN. They would be UHF?

Mr. SHAPP. Yes, sir; say, channel 72, 74 and 76.

The CHAIRMAN. What about the sets?

Mr. SHAPP. We would then have one converter at our horn location in town, convert to the low band VHF frequencies of 2, 4, and 6, and distribute by means of cable throughout the city.

The CHAIRMAN. In other words, you do the translating into the V?

Mr. SHAPP. That is right, 1 converter, 1 big antenna, which gives us better reception.

In accordance with our plan, the desired television signals at a receiving site would be picked up, filtered, stabilized, amplified, and converted in much the same way as necessary under the proposed translator service. However, by means of a highly directional antenna system—which our engineers have dubbed the "peashooter"—the UHF signals will be beamed directly to the center of the population group to be served. Maximum transmitter power of less than 0.1 watt is required for this service. At the central point in the community, the signals would be received by another high gain, highly directional antenna, and then converted to low-band VHF frequencies, channels 2 through 6. These signals will then be fed into a wired distribution system to serve the population group.

The CHAIRMAN. Let me understand this—which I don't. With the antenna on top of the mountain, you are picking up V signals; aren't you?

Mr. SHAPP. That is correct.

The CHAIRMAN. You are translating them into U signals?

Mr. SHAPP. That is right.

The CHAIRMAN. Then you are reconverting them, or reversing it back to V?

Mr. SHAPP. We are beaming them into the town as UHF, picking them up, reversing them back into V for distribution by cable.

The CHAIRMAN. The V station that originates the signal comes into the home exactly as it originated the signal, but you convert it on the way back?

Mr. SHAPP. That is right.

Mr. COX. Or on another V channel?

Mr. SHAPP. That is right.

Mr. COX. It makes no difference which channel is being used.

The CHAIRMAN. Supposing you had a town that had all U sets, or all-channel sets. You wouldn't have to do that; would you?

Mr. SHAPP. Actually anybody in Ellensburg, or any other city where we put the system, who wants to put up their own UHF antenna and pick up the signals can do so if they want. It is our opinion, as I shall go forward here to show, that the cost of doing it by cable, with 1 converter and 1 big antenna, is less than everybody buying their own UHF antenna and UHF converter.

Mr. COX. Would that signal be available to everybody in the community, or would they have to be pretty much in the direct line of sight between the two horns?

Mr. SHAPP. It is a line-of-sight proposition. At 12 miles, which happens to be the distance in Ellensburg from antenna to town, with the antennas we will use, it will be about a mile and a half across. We cannot pinpoint it like a searchlight.

The CHAIRMAN. I can buy an all-channel set and pick you up anyway?

Mr. SHAPP. That is correct.

Mr. COX. Within a certain range.

The CHAIRMAN. I would put up my own antenna.

Mr. SHAPP. I think you will find—as I will attempt to prove here—the cost and the performance is superior.

The CHAIRMAN. Why did you pick Ellensburg?

Mr. SHAPP. It so happens we have a community antenna system in Ellensburg. We have a 12-mile run that has been very costly to maintain, and also we can go to work immediately to run this test in Ellensburg. If any other city is desirous of the test, we will be glad to do it there.

Technically, this combination peashooter-cable system offers many advantages over either the straight community system or a straight translator service. By this method, only 1 UHF antenna and only 1 UHF converter are needed to serve the entire community, as contrasted with the current proposal requiring each home to have an antenna and converter. This antenna will be extremely high gain—on the order of 25 to 30 decibels—that means it is picking up signals on the order of a hundred times better than the normal UHF antenna will do it—and will feed into a relatively low-noise input UHF converter of a crystal-controlled type. The resultant signal will be far superior than would normally be received at these frequencies of an individual antenna and individual home converter.

The CHAIRMAN. Let's get this into the record. You pick it up there in the center of town, and you put your cables around. Now suppose I am living in Ellensburg, what are you going to charge me to get this cable?

Mr. SHAPP. At the present time the rate in Ellensburg is $125 and $3.50 a month.

The CHAIRMAN. That is for installation?

Mr. SHAPP. $125 for installation, $3.50 a month for the service.

The CHAIRMAN. Then, of course, your suggestion is that if I wanted to pick up those signals anyway, I would have to spend almost that much for my own antenna?

Mr. SHAPP. In Ellensburg you would probably have to spend about $100 to $110 to pick up your own signal.

The CHAIRMAN. So I am getting a little better signal—I think that is your contention?

Mr. SHAPP. That is right.

The CHAIRMAN. For approximately the same price?

Mr. SHAPP. That is right.

The CHAIRMAN. Then you have a service unit that services the place?

Mr. SHAPP. We have a company—like a small telephone company—in Ellensburg that takes care of maintenance. I might add for the record, too, sir, that the installation——

The CHAIRMAN. Where do you put these cables—underground?

Mr. SHAPP. No; on the telephone poles. We have contracts with the telephone and power companies for attaching them to their poles.

The CHAIRMAN. Just like it is here [indicating the model]?

Mr. SHAPP. That is right.

The CHAIRMAN. What would you do in Washington, where you couldn't have telephone poles?

Mr. SHAPP. Washington, D. C.?

The CHAIRMAN. Yes; right here.

Mr. SHAPP. It isn't necessary in Washington.

The CHAIRMAN. I am a great believer in abolishing telephone poles and putting everything underground.

Mr. SHAPP. They use a lot of fir, sir. [Laughter.]

The CHAIRMAN. No; they don't use fir.

Mr. SHAPP. I started to say that we have a lot of economies to affect in a community system this way, too. In the normal community system, where we come in from the edge of town, we come in from one side and then wire through the town. We have a lot of amplifiers in cascade, including those off the mountain.

The CHAIRMAN. All you are trying to say, in this whole thing, is that you think in a community similar to Ellensburg or Flagstaff, or wherever we have these peculiar terrain problems—which is mainly out in the West, although there are some places in the East, too—that you are able, through this system that you are describing, to do a better job as economically as if the individual resident tried to do it himself?

Mr. SHAPP. That is one thing, sir. In the mountainous terrain; that is the point I intend to make. However, in the flat areas, which are covered by all those pins throughout the area [indicating large map], the translator service will not provide the coverage that is proposed, and the only way that you are going to get low-cost television into all of those areas in the United States—from the Dakotas down through Texas, down in the South, and up the eastern coast—is by means of using these UHF frequencies at these places, peashooting them in, and wiring the town.

The CHAIRMAN. If you do that, maybe the individual is going to make a bigger initial investment, but in the long run, he will get better television and service—and you will sell the equipment?

Mr. SHAPP. We will sell the equipment.

The CHAIRMAN. You think you have a better system?

Mr. SHAPP. Our salesman comes into a town with three books in his briefcase and asks them which they want.

The CHAIRMAN. As I understand it, it has worked out very well in some communities?

Mr. SHAPP. Yes.

The CHAIRMAN. Now you want to go ahead in a town like Ellensburg, experimentally, and try out the shifting of the V to the U and back to the V in a community about the size of Ellensburg, which would be about 20,000 people?

Mr. SHAPP. No, it is about 12,000.

The CHAIRMAN. Your customers would number about 20,000 altogether, including surrounding areas?

Mr. SHAPP. That is right. We are prepared to go into Quincy at this time with such a system also. I have the costs worked out for Quincy, to show the relative cost of this type of service as against the translator service.

Mr. COX. How big is Quincy?

Mr. SHAPP. About 2,500.

The CHAIRMAN. Quincy grows so fast every week we can't keep track of it. [Laughter.]

Mr. SHAPP. We had trouble getting the population figures. This is a pictorial of what is described [referring to a large chart]. Here are the figures on Quincy that compare the cost of bringing television—three channels of television—by means of this peashooter-cable deal, as against just a translator.

The CHAIRMAN. What stations would you pick up in Quincy—those in Spokane?

Mr. SHAPP. The Spokane stations.

The CHAIRMAN. In Ellensburg, you pick up Seattle?

Mr. SHAPP. Two Spokane and one Seattle.

The CHAIRMAN. Which one out of Seattle?

Mr. SHAPP. I think it is channel 5.

The CHAIRMAN. KING.

Mr. SHAPP. Yes.

The CHAIRMAN. Why could you pick up KING and not pick up the rest of them?

Mr. SHAPP. There is a duplication of programs on channel 4 from Spokane and channel 4 from Seattle, and also we have a cochannel problem with the two systems and the stronger signal is Spokane.

The CHAIRMAN. It isn't because KING has a difficult signal—it is because of the programing?

Mr. SHAPP. Yes. We give NBC, CBS, and ABC programing in this manner. Here, on a cooperative basis—we have already contacted one of the leading banks out in Seattle, who is willing to finance, on a cooperative basis, the installation of cable systems in conjunction with this peashooter plan, whereby the people in a town form a cooperative, and put up whatever may be the cost per subscriber, say, $75 a person. They put up $25, with $50 advanced to the co-op by the bank for each person and paid back on a regular bank-loan basis. We have the details of the exact forms and everything else in a rough-draft form with this bank now. This plan is entirely bankable on a cooperative basis. That is the reason I said before that it is entirely likely the initial cost, on a cooperative basis, can be even under what it would cost each person to buy the converter and UHF antenna.

The CHAIRMAN. You are giving Ellensburg two Spokane stations and a Seattle station, which provide mainly national network programs?

Mr. SHAPP. That is correct.

The CHAIRMAN. What if somebody wanted to start a local station in Ellensburg?

Mr. SHAPP. Fine.

The CHAIRMAN. Does your system interfere? I am just asking this engineeringwise. That wouldn't interfere with your thinking at all?

Mr. SHAPP. Not at all.

The CHAIRMAN. How could I have a set in Ellensburg to get the local station?

Mr. SHAPP. We could put the local station on the system, as we do in many cases—make it four channels in town—or depending upon what frequency it was, say it was a high VHF channel, we could throw a switch on the back of the set and they could pick it up on rabbit ears and throw it in on the set. It works both ways.

The CHAIRMAN. So if we encourage local stations, and get their costs down, it wouldn't interfere with this system at all?

Mr. SHAPP. No, sir.

The CHAIRMAN. Well, it would interfere to the extent it might join it.

Mr. SHAPP. Some broadcasters have expressed a fear that the extension of community systems would preclude the development of new broadcast stations. Just in the past 3 weeks, there has been a station grant at Clovis, N. Mex., and Victoria, Tex., and a CP filed in Pocatello, and all 3 of these towns have community systems. The spread of community systems——

The CHAIRMAN. They are not incompatible, are they?

Mr. SHAPP. They are not. They both perform a needed service for the community.

Senator DUFF. In other words, if you get what you want from the Federal Communications Commission here, you are not going to be in a place where you have the situation preempted so that nobody else can come in afterward?

Mr. SHAPP. No, sir, Senator. In most places where this system would be used—the larger communities, frankly, can afford a cable off the mountain anyway, and in the smaller communities of one or two thousand population, they can't afford stations anyway. We will bring television into those areas in a manner that they can't get in any other way; and then if any other station—if a station does come on the air, this will not in any way interfere with the local station. It will speed the spread of television throughout the whole country.

Senator DUFF. What possible objection would there be to your getting a right of this kind, since you don't preempt any situation?

Mr. SHAPP. I would hate to make a forecast of what the Federal Communications Commission may decide.

Senator DUFF. I understand that, but I understand they move in mysterious ways in all commissions at times.

The CHAIRMAN. The Senator from Pennsylvania in trying to ascertain what possible objection could there be to this.

Mr. SHAPP. I can see none, sir. In fact, there are two precedents for this: A. T. & T. applied for, and received, permission to use the top 14 UHF frequencies for experimental purposes on their scatter tests in Florida. Also, there is a precedent in that the FM band has been used for commercial music broadcasts, and so the frequencies assigned for that purpose have been used for another purpose, because the FM frequencies were not taken up.

Mr. COX. Would this use by you of some of these top 14 UHF channels interfere with the use of those channels for the general translator purposes that the FCC has in mind?

Mr. SHAPP. No, sir. In fact, it will expand the use of translators for this reason: A translator operates on low power and must of necessity spread out. It is limited to 60 watts e. r. p. It is not directional. Ours will be a very directional—as directional as possible, at low power. We will not be subject to the interference that you will get from a number of translators in a given area. You can put a greater number of these systems to work in an area than you can on the regular translators in those top 14 frequencies. Furthermore, we would be willing to take these frequencies on a nonexclusive basis, even a secondary basis——

Senator DUFF. I think that is the important thing.

Mr. SHAPP. If some broadcaster wants to use it at a future time, fine. Let him have it.

The CHAIRMAN. In this case, there are enough of them available that are not being used. It wouldn't interfere particularly.

Mr. SHAPP. That is right.

Mr. COX. In other words, this present proposal is broad enough to permit concurrent use by you and by a translator in the pure form as well?

Mr. SHAPP. The answer is "Yes." Mr. Smith is proposing, in our application, that they just change a few words in the proposed rulemaking, and that would accommodate this peashooter plan. That is all it would take. There is no congressional legislation necessary for it. It is entirely up to them to do this.

The CHAIRMAN. Go ahead if you want to finish any more of your statement.

Mr. SHAPP. I have pretty well covered most of the things I have here.

The CHAIRMAN. We will put the whole statement in the record.

(The balance of the statement is as follows:)

The UHF signals picked up are converted, as I stated previously, to VHF channels at a central point in town. Since they will be carried out to all sections of the community via cable from this central hub, great economy in the community system layout can be effected over the conventional community antenna system. The number of amplifiers in cascade normally needed can be greatly reduced. This not only increases the quality of reception throughout the community, but also reduces the complexity of equipment and makes it easier to maintain the system at a high operating level. The cable will serve all homes in the area. Thus, there will be no shadow areas caused by hills or tall buildings.

Economically, it can be shown that for any community that has a density of 60 or more homes per mile, the cost per subscriber with normal expected television saturation in the community will be less by this means than for each person to install his own individual UHF antenna and converter. The cost of the 0.1 watt peashooter on top of the mountain will be substantially less than the cost of the 10-watt proposed translator. Thus, the overall cost per subscriber will be much less when connected to the combination cable-peashooter system than when receiving UHF signals direct from a translator.

The accompanying chart (having reference to a large chart displayed in the hearing room) shows these relative cost figures for 40, 50, 60, 70, 75, and 80 percent saturations worked out for comparative translator and cable-peashooter systems that might be installed in Quincy, Wash. You will note that at only 50 percent saturation (and more than 50 percent of the people in Quincy already have VHF television sets) the cost per subscriber on a cooperative basis for installing and connecting to a combination cable-peashooter system is $80, whereas the cost of installing a UHF antenna and converter and bearing a proportionate share of the translator cost is $83 per subscriber. As saturation increases, the cost differential per subscriber becomes even more favorable for the cable-peashooter system. For example at 80 percent saturation, these figures become $65 to $80 in favor of the peashooter.

The Jerrold plan has another very great advantage in that each person connected to the system will of necessity carry his fair share of the cost for the entire system. Because of this, it is possible to obtain bank financing for the citizens of the community to install a system of this sort on a cooperative basis. Our company has been in contact with one of the leading banks of the Northwest which is willing to loan approximately two-thirds of the money necessary to install cooperative systems in these communities. Contracts for handling the paperwork on these loans have already been drafted.

Our company is prepared to work with the citizens of any community in the Northwest States to install either a community antenna system, or a translator or a peashooter system to bring quality television reception to them at the lowest possible prices. In most communities, as in Quincy, the cost per subscriber for a cooperatively owned peashooter system will not exceed $75 for the connection. Service can be rendered on a cooperative basis for less than $2 a month.

For technical and economical reasons, it is our belief that the translators proposed in FCC Docket 11611 will find application primarily in those communities that are situated close to a receiving location and where the density of population within the community is so low that distribution of signals to the viewers by means of cable would prove uneconomical.

There are many areas of the country now without television wherein the proposed translator alone cannot be effective at all. This map of the United States [having reference to a large map on display in the hearing room] shows almost 600 communities which, according to the latest figures published by Television Digest in January of 1956, have less than 10-percent television saturation. This low saturation is indicative of only one thing, lack of adequate reception. This is only a partial list of television deficient areas throughout the country. So great is the public's desire for television that even in areas where reception is very poor, even with high-cost roof antennas, saturation often exceeds 10 percent.

In most of these areas, there are no favorable mountaintops to provide receiving sites for television signals and to provide transmitting sites for the translated UHF signals. Thus, there is little, if any, application for the proposed translators in these areas. All through the South, Mississippi, Alabama, Florida, Georgia, et cetera, through the great Midwest plains of Nebraska, Kansas, Iowa, and on up through the Dakotas and back down into the southwest of Texas and Arizona, one finds that great distance is the barrier and not mountainous terrain.

To bring television to these communities, once again we propose the use of UHF peashooters, this time serving as milliwave links instead of more expensive microwave common carrier links. These smaller communities cannot afford the cost of bringing television signals to their communities by means of microwave.

The upper 14 UHF channels are not being used today for any broadcast purpose. A. T. & T. has already received permission to utilize these frequencies for experimental purposes relative to scatter broadcast. We will request permission from the FCC to use the top 14 UHF frequencies for UHF Peashooters to supply signals for community systems all over the United States. With high directional antennas and limited power, there is no danger of interference to be caused by this service. Our proposal is to supplement the translator service, not supplant it.

The granting of this proposal would make it economically and technically feasible for any community of over 1,000 population anywhere in the United States to have television reception—in most cases of a multichannel nature—by the end of 1956. There need be no blacked-out television areas in this country.

The equipment to do this job is already developed and most of it is already in large-scale production. With FCC approval, the UHF Peashooter program can start immediately. There need be no area in the United States without television by the end of the year.

Mr. SHAPP. Would you care to go over the costs to show how the costs are lower off this plan than off the translator?

The CHAIRMAN. I think you should say something about that, because it was my understanding, when the Commission was here, that they were inclined to lean toward a solution of this problem through the translator. We queried them at some length as to the cost of translators. There were varied answers as to the costs, and as to whether the service would be as economical as alternatives such as the one you propose, but I would think they might run about the same. I think what you are trying to say—and what you have perhaps proven—is that in some communities you can give a better service.

Mr. SHAPP. That is correct. Also there has been a lot of misconception on the price.

The CHAIRMAN. If I lived in Ellensburg, which is a nice place to live, incidentally—— [Laughter.]

Senator DUFF. I believe you stated it pretty well.

The CHAIRMAN. Yes; it is a beautiful town—I probably would want this. Suppose it might cost me a little more to have this service, still I would know I was getting good service and, therefore, I would be willing to pay this extra cost.

Mr. SHAPP. And you know the service is there to stay.

The CHAIRMAN. And I have got some maintenance, too.

Mr. SHAPP. You have more maintenance on a UHF converter and antenna than you do off the system.

The CHAIRMAN. As the Senator from Pennsylvania just mentioned to me, what was maybe bothering him, and surely would bother me, too, is whether or not you are getting something exclusive, but in this case you are not.

Mr. SHAPP. No, sir.

The CHAIRMAN. In other words, I can take it or leave it, can I?

Mr. SHAPP. That is right. If anybody in the town wants to put up their own antenna to pick up the signals, they could do that, too.

The CHAIRMAN. You couldn't stop them from doing that. I would say, going back to Ellensburg, that 9 chances out of 10, they probably wouldn't want to.

Mr. SHAPP. That is right. I think we can prove that quite easily.

The CHAIRMAN. There would be no objection of a public policy nature, because you are not taking an exclusive right at all.

Mr. SHAPP. In most of these towns through here, I believe that you will find the cooperatives will form in these towns, and they will operate this peashooter service themselves, to bring the service into the town. They will hop from town A to B to C.

The CHAIRMAN. Let me ask you this now. How many cooperatives have been formed in the United States?

Mr. SHAPP. In the United States, I am familiar with about 10 or 15 of them, sir.

The CHAIRMAN. How many other systems do you have that you service now?

Mr. SHAPP. Systems?

The CHAIRMAN. Yes; about 300?

Mr. SHAPP. Altogether, about 400 systems in the country.

The CHAIRMAN. The bulk of them are now being operated as a local corporation for profit—and there is certainly nothing wrong with that.

Mr. SHAPP. That is correct.

The CHAIRMAN. There is a movement to form cooperatives?

Mr. SHAPP. It will be a lower cost, and this movement is definitely on. The price has been proven, and people will form these cooperatives. The banks can step in and finance it.

The CHAIRMAN. Take Walla Walla. That is a private company, isn't it?

Mr. SHAPP. Yes, sir.

The CHAIRMAN. You charge so much and make a profit?

Mr. SHAPP. It cost about $230,000 to put in that system in Walla Walla.

The CHAIRMAN. I think people are entitled to a reasonable profit if they put up their money for these systems.

Mr. SHAPP. It is a great risk business.

The CHAIRMAN. But there is a chance that there will be more and more cooperatives formed; and, as you say, financial institutions may loan the money for the initial capital cost, and then you could go on from there.

Mr. SHAPP. That is right.

The CHAIRMAN. That is entirely a matter of choice of the people in the area.

Mr. SHAPP. I think this plan here will further because it makes a low-cost project. You can say it is going to cost X dollars. Each person coming in the cooperative will pay so much. When you get above a certain saturation, they can pay the money into the cooperative for expanding the system or reducing charges.

Mr. COX. Would there be some chance, if you started a cooperative in one of these areas of reasonable size, that you could build up the set circulation to the point that, if the cost of operation of TV stations is reduced, you might create a situation where a TV station could go in where it couldn't if it had to go in cold and build up set circulation itself?

Mr. SHAPP. I believe that happened, frankly, in Victoria and in Clovis, N. Mex. They are getting enough sets there now so the risk of putting in their own station is reduced.

The CHAIRMAN. What about Walla Walla? There would be no chance for a cooperative there as long as the other fellow is there?

Mr. SHAPP. No. In these bigger cities it is entirely possible the cooperatives will not be practical anyway. It is too much money and too much bother. But, frankly, this plan is designed to bring it into the smaller communities. There it is. We can get the finances to wire up these big communities. It is in the small communities that, frankly, it is uneconomical for a man to invest his money, because he can't make enough out of it anyway, it is a big-risk deal, and it is lower cost for the people to pay out.

The CHAIRMAN. The Commission just ruled against the Bridgeport booster, didn't they?

Mr. SHAPP. Yes.

The CHAIRMAN. Do you think you are offering an alternative solution to that service?

Mr. SHAPP. Yes, sir.

The CHAIRMAN. In a town like Bridgeport?

Mr. SHAPP. Yes, sir.

The CHAIRMAN. Or Quincy?

Mr. SHAPP. My recommendation for Bridgeport at this time would be a translator—with 230 homes, and spread way out. If you say it is growing, it is possible that the people know this.

The CHAIRMAN. Quincy is good for this?

Mr. SHAPP. Yes, sir, for the peashooter and a cooperative deal on wiring, because the costs would much less than they would be otherwise, and the service would be far superior. This is a map of Bridgeport, by the way, an aerial photograph [indicating] which we took, which shows how sparsely settled the area is.

The CHAIRMAN. That is because of the dam construction. That is a little different case. Quincy is growing to be a solid community, and as the Columbia Basin lands come in, it will get bigger and bigger. It will be a long time, however, before it will be big enough to support a TV station.

Mr. SHAPP. That is correct. If the people in Quincy would want to, they could have TV on this principle starting tomorrow, by depositing $75—and the bank will put up $50 to his $25. He signs up, and gets service at less than $2 a month on a cooperative basis. We will take a contract on that.

The CHAIRMAN. Quincy is technically off the air right now, with the booster. The FCC would have to act on your application very quickly?

Mr. SHAPP. Yes, sir.

The CHAIRMAN. You think you offer the alternative—what they should do in Quincy? You use that as an example?

Mr. SHAPP. Yes, sir.

Mr. COX. Their time for comments closes on March 15 in that translator proceeding?

Mr. SMITH. That is right. Mr. Shapp's proposal will be part of those comments and will be filed right away.

The CHAIRMAN. When did you file your applications?

Mr. COX. Monday.

The CHAIRMAN. You are going to file it Monday?

Mr. SHAPP. We will file it Monday. We hoped to file it yesterday, but we got tied up.

The CHAIRMAN. I do not think the weekend will make much difference.

We are interested in this because it so happens that there is this problem in my own area—but it is equally true, I think, in many areas west of the Mississippi River.

Mr. SHAPP. The problem exists right now, out in your area, as how to get TV to these people because many of them have bought sets, have spent a lot of money on it, and it is necessary to fill the vacuum.

The CHAIRMAN. I think the problem you have is that you are in the nature of a common carrier under Government license, and, therefore, you have to be sure that you are giving the service that the people pay for.

Mr. SHAPP. Senator, was that a statement or a question, about the common carrier?

The CHAIRMAN. You are in the nature of a common carrier, aren't you? You are operating under a Government license, and coming into the people's homes like electricity, water, and all these other things.

Mr. SHAPP. We are a public service company.

The CHAIRMAN. As long as you are giving the people what they pay for, I do not think anybody would get mad about that. I think you would give them better service. I think that is your point.

Mr. COX. If it were set up on a cooperative basis there would be no problem of regulation at all, because there would be no profit by anyone.

Mr. SHAPP. There is no profit.

Mr. COX. If there were an override on costs, it would be applied to future costs to reduce carrying charges?

Mr. SHAPP. They might add another channel or do a lot of things. Maybe the cooperative some day will put the local TV station on the air. These things would be determined by the local group who formed the cooperative.

The CHAIRMAN. Yes. Out in my State, under our State laws, they can easily form these cooperatives.

Mr. COX. Would there be any chance, once you have beamed the converted signal down the mountain, to reconvert it down here and to broadcast it—not transmit it by cable—on another low V channel? Is the nature of some of these areas such that that could be done free of interference? At least, I suppose it would require an FCC license for it?

Mr. SHAPP. It would call for an FCC license also. I think you would have the problem of financing this, sir, because when there is a cable each person who gets a signal is getting it because he is connected to the cable. There is none of this passing the buck—"Let my neighbor do it, or let somebody else in town support this thing."

Mr. COX. The costs can be fairly distributed to all those actually benefited?

Mr. SHAPP. That is right.

The CHAIRMAN. The cable is connected right to the home. You don't have an antenna there at all?

Mr. SHAPP. No. The cable goes right in. There is a terminal board, like a telephone terminal, that goes in the wall behind the set. It is wired directly to the receiver. There is no antenna—no antenna or converter problems.

The CHAIRMAN. Let me ask you this question: What problem do you think you will have with the originating station? You have to get their permission to pick that signal up; don't you?

Mr. SHAPP. No, sir.

The CHAIRMAN. Why not?

Mr. SHAPP. We are providing an antenna service, and not a program service, and it is our contention—although I should let our attorney speak, I guess.

(Discussion off the record.)

Mr. SMITH. Our point, Senator, as to why we do not think it would be necessary to receive permission in this instance is that Mr. Shapp's peashooter idea is what one of his engineers called "the poor man's microwave." The telephone company, when it furnishes off-the-air pickup service of this variety, using microwaves for an antenna system, doesn't have to get permission from the broadcaster to do it. We are actually substituting a radio technique for a wire technique here. Our transmission is not in the nature of a broadcast, and therefore we do not think the provisions of the Communications Act prohibiting rebroadcasting without permission of the originating station would be applicable.

The CHAIRMAN. You would have to be very careful that when you pick it up you do not interfere with it in any respect, so that it comes out just the way you pick it up.

Mr. SMITH. That is correct, absolutely.

The CHAIRMAN. Because sometimes, in some of these cases—not in my State, but this happened down in Nevada—a booster operator started putting in his own local advertising. Of course, the advertiser wouldn't care in your case, because he is just getting bigger coverage.

Mr. SHAPP. The stations don't care, either, because they are getting better coverage.

The CHAIRMAN. I would think you would have to have permission from the station.

Mr. SMITH. We do not feel so. We may have a point that we have to clarify.

The CHAIRMAN. Don't you get permission sometimes?

Mr. SMITH. Only on an informal basis. We went into it this morning. Briefly, the stations, many of them, are not in a position to grant permission because they do not own all of the property rights—if they have any, once the signal is broadcast——

The CHAIRMAN. Some of them feel they can't delegate it.

Mr. SMITH. That is right. I do not want any misleading statements on the record, but generally the attitude of the broadcaster is, "We are happy to have the additional coverage that comes out of these systems." They cooperate, send their programs out so we know what is going to be on the air, but they say, "Go ahead and do it, and don't ask us for permission."

The CHAIRMAN. In other words, as I understand it, you have had no objection to date from the originating stations.

Mr. SMITH. We have had 4 or 5 objections in the 5-year history of the industry. None has ever been litigated.

The CHAIRMAN. What are they about?

Mr. SMITH. They challenge us as infringing their property rights in their broadcast programs. Whenever that question has arisen, we have had conferences with the people involved. Up to now we have never been taken to litigation on the question. We think an antenna does not infringe any property rights.

The CHAIRMAN. What would be the reason for objecting, basically?

Mr. SMITH. We are at a complete loss to understand.

The CHAIRMAN. Unless somebody wanted to be stubborn.

Mr. SMITH. They might feel they wanted us to pay them for use of their programs. I think the reason they haven't made a real issue out of it is that as a practical matter there isn't enough for it to create any problem for them. None of them have really demanded litigation.

The NARTB recently said that if any broadcaster wanted to litigate this problem, they would file a brief in support of the broadcaster in court, but so far it has not come to a legal issue.

Mr. COX. You mentioned that maintenance would be taken care of as part of this system. That, however, is maintenance of the system, of the amplifiers in the system, etc. It does not have anything to do with the maintenance of the individual set?

Mr. SHAPP. No. Our maintenance would go to the maintenance up to the wall behind the set, and the TV serviceman in the town would take care of the servicing of the set.

Mr. COX. Your installation charge is the charge for carrying the cable down to the plate behind the set, and it is not a charge the serviceman might make when he first puts the set in and puts it in operation?

Mr. SHAPP. That is correct.

The CHAIRMAN. In other words, you are an antenna service?

Mr. SHAPP. That is all we are. That is all we hope to be. We would like to extend this antenna service into many, many more communities throughout the country.

The CHAIRMAN. Well, I do not know—if you are not exclusive and are not interfering with anybody else's right to do what he wants to do—why you shouldn't be allowed to do it.

Mr. SHAPP. I hope so, too.

The CHAIRMAN. In other words, I have the choice. I can take you or leave you if I live in a given community. If I think you are not giving me the service I am paying for, I can drop the service and put up my own antenna.

Mr. SHAPP. Yes; or you can put up a translator. There is nothing to give an exclusive to the peashooter.

The CHAIRMAN. You are not interfering with anybody starting a local TV station?

Mr. SHAPP. Not at all. I sincerely feel, Senator, that this plan could be put into operation, with the approval of the FCC, and within a very short period of time you would have no more problems with blacked-out areas in the country. It would be covered.

The CHAIRMAN. Of course I want you to know I am giving you a curbstone opinion here. The FCC may have a lot of reasons why you should not be allowed to do this.

Mr. SHAPP. You may be on the curbstone, sir, and I am down in the gutter looking up. [Laughter.]

The CHAIRMAN. After all, I think you are contributing an idea, because what we are trying to do is get television to the small communities. We think they need it, we think they are entitled to it, and we want to do everything we can to pursue that goal. You are in effect contributing an idea as to the way in which you think it can be done.

Mr. SHAPP. That is correct.

The CHAIRMAN. Offhand, I say I do not know of any reason why they shouldn't allow you to do this, or give you the authority to do it, if you do not get into what Senator Duff mentioned—exclusiveness of right in a given situation.

Mr. SHAPP. I do not think we need it, nor would we want it.

The CHAIRMAN. Anybody can take your service or leave it.

Mr. COX. Is there a possibility that there might be services other than broadcast services that would be interested in these frequencies if the use you propose were not to be made of them?

Mr. SHAPP. There is no use for it at the present time. In fact, they are called the useless UHF frequencies.

The CHAIRMAN. As I understand it, you would be touching only frequencies that are not being used anyway?

Mr. SHAPP. They are not being used. They are up in space.

The CHAIRMAN. If there is any conflict, there are all sorts of frequencies left?

Mr. SHAPP. Yes, sir.

The CHAIRMAN. Well, thank you very much. Can you take care of South Carolina?

Mr. SHAPP. Well, it just so happens that in South Carolina we have got one.

The CHAIRMAN. Well, tell us about South Carolina. The Senator from South Carolina just showed up.

Mr. SHAPP. I happen to have my South Carolina salesman here. Jerry, do you want to take over and talk about South Carolina?

The CHAIRMAN. Senator Thurmond, he was talking about their plan to make television available to the smaller communities. They have what they call a community antenna system, which can be run as a cooperative or any other way they want to handle it. They put an antenna and a transmitter up on a mountaintop and bring the signals down and retransmit them on cables to the different homes. South Carolina is one of the places where you have kind of a rugged terrain, in spots, where they can't get television.

Senator THURMOND. The upper part of our State is rather hilly.

Mr. SHAPP. Here is an area in North Carolina and South Carolina [indicating on the map] where the red pins represents towns of one to five thousand population, and the green dots are over 5,000 population. These towns have practically no television today, and there is very little likelihood that they will.

Senator THURMOND. None of these towns have television?

Mr. SHAPP. That is right. They may have 10 percent saturation.

Senator THURMOND. You have some of those right by Columbia; haven't you?

Mr. SHAPP. Here is Columbia here—these are about a hundred miles from Columbia.

Senator THURMOND. Where you have got those pins would not be a hundred miles.

Mr. SHAPP. We have just put these in the center of the county. Actually, on a map of this size, we have made no attempt to pinpoint the exact town.

Mr. ZAPPLE. Why don't you have your salesman indicate the figures showing what communities do not have television?

Mr. SHAPP. We are getting the figures here now. We have the map of South Carolina, that shows the counties and shows the saturation of television.

Senator THURMOND. You will notice in the eastern part of the State there is Florence. They have a station in Jefferson County now.

Mr. SHAPP. This area here seems to be getting television [indicating].

Senator THURMOND. I mean the eastern part.

Mr. SHAPP. Down through here?

Senator THURMOND. No; that is the southern. Right along where you are now.

Mr. SHAPP. In Florence?

Senator THURMOND. They have a big TV station there now in Jefferson County.

Mr. SHAPP. They just went on the air. These figures are for December. They went on in February.

Senator THURMOND. They have a good station there.

The CHAIRMAN. That is the only one in eastern North Carolina?

Mr. SHAPP. No, these do not have television. Some of this area is getting it because the station just went on the air.

Senator THURMOND. This Florence station will go out for 75 miles.

Mr. SHAPP. It is possible most of these areas will get coverage from the Florence station.

Senator THURMOND. Florence will cover this whole area.

The CHAIRMAN. Yes, but your problem is up in those mountainous areas. They will have to have this system, or some other type.

Senator THURMOND. Greenville has some coverage in the mountains up there. They have one on a mountaintop, and Spartanburg will soon have one on the mountain.

The CHAIRMAN. That is what you are doing.

Mr. SHAPP. It is entirely possible there will be no need for a system of this type in that area.

Senator THURMOND. Charlotte, Greenville, and Spartanburg will take clear down to Columbia, and Florence and Charleston will take care of this area you have got shaded.

Mr. SHAPP. As the stations come on the air in some territories of this sort it is entirely possible that these pins will have to be pulled off the map. However, I might also add that there are a lot of places that are not shown on this map that actually do not have television, because these figures are based upon counties. You might have 1 city in a county getting television, which would raise the percentage of that county over 10 percent, and there might be some other outlying towns in the county who would not be getting any television.

Senator THURMOND. Savannah covers our area, too.

Mr. SHAPP. In the flat country, stations can get out quite a way.

The CHAIRMAN. I have no further questions, Mr. Shapp.

Senator THURMOND. I am glad you are interested in improving coverage. We can always use better coverage.

The CHAIRMAN. You get your application in Monday or Tuesday and we will inquire of the Commission what they think about it and hope that they act promptly on the matter—as promptly as possible, so that we can get some of these matters settled, because out in my State, now that they declared the boosters illegal, we want those people to get television, and maybe you have the solution. Maybe you have the answer. I don't know.

Mr. SHAPP. I think we have, sir, and we will certainly be glad to get out there and talk to the people and show them what we have. I think we can solve their problems.

The CHAIRMAN. I am sure the Commission will take a look at this proposal because it seems to me to suggest an alternative for some of the things they are discussing. However, they did put a great deal of emphasis on translators when they were here.

Thank you very much.

Mr. SHAPP. Thank you, sir.

The CHAIRMAN. We have no further witnesses today. We will leave the date open. The committee will resume at the call of the Chair.

(Whereupon, at 3:10 p. m., the committee adjourned.)

TELEVISION INQUIRY

WEDNESDAY, MARCH 14, 1956

UNITED STATES SENATE,
COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE,
Washington, D. C.

The committee met, pursuant to notice, at 2 p. m., in room P-63, United States Capitol, Senator John O. Pastore, presiding.

Present: Senators Pastore (presiding) and Purtell.

Senator PASTORE. The hearing will come to order.

Before hearing from the first witness, there is a statement that I am going to make for the record.

We are resuming hearings this afternoon on the UHF problem and the general question of allocations. Before calling our first witness, there are a number of items to be placed in the record.

1. Letter dated March 6, 1956, from Paul M. Butler, Chairman of the Democratic National Committee, to Senator Magnuson, regarding his request to the major television and radio networks for time for a reply to President Eisenhower's announcement of his willingness to run for office again. Mr. Butler sugests that the committee ask the networks to explain their refusal of equal time. Senator Magnuson has asked me to announce that he hopes the networks will give careful consideration to the issues raised in Mr. Butler's second telegram, and to state again that questions regarding political time will be gone into at a later date.

2. Letter from Richard S. Salant, chairman of the television transmission tariffs committee of the National Association of Radio and Television Broadcasters, clarifying the status of that committee's study of the reasonableness of the telephone company's charges for intercity relays and correcting any misunderstanding that might have arisen as a result of the testimony of Mr. McConnaughey on February 21, 1956, to the effect that the industry had studied such rates and they were likely to go up.

(NOTE.—This letter should be read in connection with Mr. McConnaughey's testimony, pt. I, p. 181. See also letter from Mr. McConnaughey dated March 23, 1956, with regard to this matter, which is printed at p. 785.)

3. A further statement by J. E. O'Neill, of Station KJEO, Fresno, Calif., supplementing his statement filed March 2, 1956, and pointing out that, as he had prophesied, when his application for a stay holding in abeyance the grant of a V in Fresno pending appeal was denied, he was immediately notified by CBS that it was canceling his affiliation contract effective next June, when it is expected that the V station will be on the air.

4. Letters from (a) the National Grange and (b) the National Council of Farmers Cooperatives opposing any reduction in television service to rural areas.

5. A letter from the National Legislative Committee of the American Legion, forwarding a resolution of the national executive committee of the American Legion on continuation of free television broadcasts in the interest of hospitalized veterans.

(NOTE.—Pursuant to later request by said committee, this letter is printed in connection with other material relating to subscription television and will be found at p. 1054.)

6. Petition addressed to Senator Wayne L. Morse by a group of residents in Scottsburg, Oreg., urging licensing of television reflectors.

7. Two letters from UHF station operators, (a) Leo B. Keegan of station WNLC of New London, Conn., and (b) O. E. Richards of WFAM-TV, Lafayette, Ind.

8. Statement of Stewart Watson, president of Monona Broadcasting Co. of Madison, Wis.

(NOTE.—See, in connection with this statement, the counterstatement of Arthur W. Scharfeld on behalf of Radio Wisconsin, Inc., of Madison, Wis., printed at p. 749.)

(The matter referred to is as follows:)

ITEM I

DEMOCRATIC NATIONAL COMMITTEE,
Washington, D. C., March 6, 1956.

Hon. WARREN G. MAGNUSON,
Chairman, Senate Interstate and Foreign Commerce Committee,
Washington, D. C.

DEAR SENATOR MAGNUSON: Immediately upon the announcement that Mr. Eisenhower again would be a candidate, I dispatched the following telegram to each of the major television and radio networks:

"Since Mr. Eisenhower has requested and received all radio and television networks tonight to discuss his candidacy for reelection, I respectfully request, in keeping with established procedures, equal facilities for the Democratic Party. Kindly advise at your earliest convenience."

This request was promptly rejected by all four of the networks. I sent a second telegram, as follows:

"I have received your refusal to provide public service time to the Democratic Party to balance the time which was given to Mr. Eisenhower's political address last night. May I respectfully suggest that you reconsider your arbitrary decision, which appears to have been based upon the advice of your lawyers that we have no legal recourse to force you to grant fair treatment to the Democratic Party. In support of my suggestion that you reconsider your decision, let me cite these facts:

"(1) Mr. Eisenhower's address was political. He spoke as a candidate. He outlined his program. His radio and TV talk produced such headlines as that in the Washington Post this morning: 'Ike opens 2d term drive in TV talk,' and that in the Washington Evening Star today: 'President launches his campaign.'

"(2) My request for time for the Democratic Party was based not upon legal grounds but upon the moral responsibilities of the networks to give the same treatment to both political parties. I contend that when the President makes a political talk, which is carried by the networks without charge, the other party has a moral right to an equal amount of free time.

"(3) Your position that your network has no obligation to give the Democratic Party equal time when free time is given to the President for a political talk sets the precedent that the President can campaign free of charge from now to the convention. The only opportunity open to the Democratic Party to obtain equal airing of its views would be to purchase expensive time. Such a situation would constitute, I must point out, a corporate contribution of hundreds of thousands of dollars to the Republican cause.

"(4) Some representatives of the networks are currently seeking for a relaxation of present laws which are designed to protect the parties and their candidates from arbitrary favoritism by the networks. It is argued that the networks can be trusted to act fairly without the force of law to compel them to do so. Your action today seems to me to greatly weaken the case for relaxation of the existing rules.

"(5) If the networks persist in the position that the Democratic Party can expect fair treatment only when there is a law to compel fair treatment, I feel confident that the Congress will want to explore this problem fully and take whatever steps the Congress deems necessary to assure fair treatment to both major political parties.

"In conclusion, I should like to suggest that the clear legislative intent of the Congress has been that networks and the member stations which our Federal Government licenses are intended to serve all of the people, not merely whatever party may happen to be in control of the executive branch. Your action today seems to me to be in clear violation of the spirit of the present law and the intent of the Congress. Your action today does not merely deprive the Democratic National Committee of an opportunity to present the views of the Democratic Party: It also deprives the millions of Americans who belong to the Democratic Party of the right to hear from their leadership—a right which you gave last night to the millions of Americans who are Republicans. In the name of fair play, I call upon you again to reconsider your hasty decision."

In response to the second telegram, the Mutual Broadcasting System offered equal time on March 7 from 10 to 10:20 p. m. to a Democratic spokesman who is not a candidate for public office this year.

I respectfully suggest that you might want to consider asking the presidents of the other three networks to appear before your committee and explain in detail for you their refusal of our request for equal time.

I will advise you further as soon as these networks have replied to our second telegrams.

With warm personal regards, I am

Sincerely,

PAUL M. BUTLER.

ITEM 2

NATIONAL ASSOCIATION OF RADIO AND TELEVISION BROADCASTERS,
Washington, D. C., March 7, 1956.

Hon. WARREN G. MAGNUSON,
Chairman, Committee on Interstate and Foreign Commerce,
United States Senate, Washington, D. C.

DEAR SENATOR MAGNUSON: It has come to my attention that on February 21, 1956, the Honorable George C. McConnaughey, Chairman of the Federal Communications Commission, in testifying before your committee concerning the American Telephone & Telegraph charges for intercity television transmission, stated (mimeographed transcript, p. 552):

"I think we might tell you they are very apt to go up. The television industry has made a very close study of it at a number of conferences which were had, and I think from the standpoint of costs they are apt to go in the opposite direction."

While Mr. McConnaughey's statement concerning the "television industry" and its views concerning television transmission tariffs is not wholly clear, this testimony has given rise to considerable misunderstanding concerning the status of a study currently being conducted by a committee, established by the National Association of Radio and Television Broadcasters, and known as the Television Transmission Tariffs Committee, of which I am chairman. Accordingly, I am writing this letter in order to report on the status of this committee's study.

The Television Transmission Tariffs Committee was established by the Television Board of Directors of the National Association of Radio and Television Broadcasters at a meeting of the board, January 26, 1955. To quote from the resolution, it was "created for the purpose of investigating the reasonableness and validity of common-carrier tariffs relating to intercity relay filed with the FCC." After preliminary organization meetings, the committee met on March 21, 1955, and April 7, 8, 1955, with representatives of American Telephone & Telegraph. It soon became apparent, as a result of these meetings, that a determination of the reasonableness of A. T. & T. intercity television transmission charges was exceedingly complex and that the committee could itself reach no conclusions. Accordingly, on May 5, 1955, the committee recommended to the National Association of Radio and Television Broadcasters that, because of the complexity of the issues, and their transcendent importance to the industry, a fund be raised from voluntary contributions by television stations and networks, in order that outside experts could be retained to make a comprehensive study of the A. T. & T. rates and the basis therefor. A copy of the committee's report and recommendation to the NARTB is attached hereto.

The NARTB approved the committee's recommendation, and the stations and networks have contributed in excess of $50,000. The law firm of Cravath, Swaine & Moore, New York City, has been retained to make the study recommended and to report to the committee, and the industry concerning the basis of A. T. & T.'s rates, its costs, and the reasonableness of the rates. The law firm is now only in the earliest stages of its study, and is currently seeking to obtain necessary information from A. T. & T. Because some questions have arisen concerning the information which Cravath, Swaine & Moore have requested of A. T. & T., a meeting between the committee and A. T. & T. representatives is scheduled for March 16, 1956.

It is apparent from these facts, therefore, that the question of A. T. & T.'s charges and costs is now under intensive, but still very preliminary, study by the television industry. Certainly, no conclusion, tentative or otherwise, has been reached by the committee, or the television industry, that A. T. & T.'s costs have risen or that any rate increase is warranted.

In order that there be no misunderstanding about the work of this committee, to which the television industry has so generously contributed in both confidence and funds, we would appreciate your placing this letter in the record of the current hearings of your committee.

Yours very sincerely,

RICHARD S. SALANT,
Chairman, Television Transmission Tariffs Committee, National Association of Radio and Television Broadcasters.

RESOLUTION BY THE TELEVISION TRANSMISSION TARIFFS COMMITTEE, WASHINGTON, D. C., MAY 5, 1955

Whereas the issue of tariff rates is of transcendent importance to the whole structure of the television broadcasting industry, and a rate increase might have disastrous consequences to that structure; and

Whereas it appears from the subcommittee report that it is extremely difficult to reach a conclusion as to whether present tariff rates are reasonable or unreasonable; and

Whereas a proper approach to the resolution of the problem would be very costly and time consuming, involving the engagement of outside experts and the expenditure of several hundred thousands of dollars, even without litigation; and

Whereas because of the difficulties described in the subcommittee report, the committee can give no assurance that an expenditure of as much as half a million dollars would result in action which would either reduce or even maintain present rates; and

Whereas since the establishment of this committee and the preparation of the subcommittee report, the A. T. & T. has postponed a rate increase for 6 months; and

Whereas this 6 months' period provides the opportunity for additional organizational and preparatory efforts: Therefore be it

Resolved (as a recommendation to the TV board of the NARTB), That an all-industry committee be formed; and that this all-industry committee take all steps necessary and desirable to assure the availability of funds and expert judgment to resist any requested rate increase; and that this all-industry committee meet regularly in order to keep informed of the situation and to keep the public and the industry apprised of the current status of A. T. & T. intercity video rates.

ITEM 3

FURTHER STATEMENT OF J. E. O'NEILL, STATION KJEO, FRESNO, CALIF.

Mr. Chairman and members of the committee, my name is J. E. O'Neill, and I am the operator, through the O'Neill Broadcasting Co., of UHF television station KJEO at Fresno, Calif.

On Friday, March 2, 1956, my statement regarding the deintermixture situation at Fresno, Calif., was filed with this committee and inserted in the record. In that statement I referred to the fact that UHF station KJEO at Fresno was in immediate danger of losing its CBS affiliation to the newly granted VHF station; that all of our requests to the Federal Communications Commission for relief had been turned down; that we had sought review in the appellate court of the Commission's action in making the VHF grant in an all-UHF community, and that the matter was now pending in the court. I pointed out that in similar cases the court had indicated that such matters were the responsibility of the Commission. The court in that case had said, "If extinction of UHF stations results from the Commission's policy and actions, the responsibility must lie at the Commission's door."

What I stated in my former statement that I feared would happen has, in fact, happened.

On Friday, March 2, 1956, the date of the presentation of my previous statement, the appellate court denied our application for a stay order to hold the VHF grant in abeyance pending a final determination by the Commission and the courts. This means that the VHF station can now undertake construction. Within several hours of this decision I received notice from CBS of cancellation of KJEO's affiliation agreement, effective in June of this year, by which time it is estimated the construction of the VHF station will be completed.

Thus, after 2½ years of service to the community and an investment of over $600,000 and great effort and money in building up a UHF listening audience, we now face extinction because the Commission has permitted the injection at this time of a VHF station in a UHF community. While we suffer the loss of the network and face possible loss of our station and investment, the public interest will suffer even more in the possible creation of a one-station VHF community. You are familiar with stories of other UHF stations in the same situation.

Only quick and decisive action by this committee and by the Commission can stave off the disaster which we, as well as the other stations, face in attempting to operate against the unfair competition of a VHF station. This relief must come within the next few months, either by way of definite deintermixture of UHF communities or of the drop-in of VHF channels for the use of stations such as ours.

As I stated in my earlier statement, the facilities provided must be on a competitive basis. It has already been amply demonstrated that lack of equal or competitive facilities in a market leads to the curtailment of service and the denial to the public of free choice in the selection of programs. This committee and the Commission should immediately take proper steps to make communities such as Fresno either all-UHF or all-VHF; otherwise, there will be complete obliteration of UHF stations—the very real future we now face in Fresno unless prompt relief can be brought us.

Respectfully submitted.

J. E. O'NEILL.

March 6, 1956.

ITEM 4 (A)

THE NATIONAL GRANGE,
Washington, D. C., March 5, 1956.

Hon. WARREN G. MAGNUSON,
Chairman, Interstate and Foreign Commerce Committee,
United States Senate, Washington, D. C.

DEAR MR. CHAIRMAN: As an organization representing nearly 1 million farm people, the National Grange is vitally interested in the hearings inquiring into television problems now being held before your committee.

Your committee is fully aware of the fact that farmers and other rural people depend more on radio and television, where it is available, for entertainment, news, information vital to the conduct of their business and cultural and educational material than do the citizens of our country residing in large cities. This is obviously so because they live in remote areas and do not have readily available to them the many sources of news, education and culture that are available to the inhabitants of our cities.

The last annual meeting of the National Grange was held in Cleveland, Ohio, in November of last year, and at that meeting the following resolution was unanimously adopted:

"The Grange, realizing the growing importance of television, opposes any action by the Government which would in any way reduce existing television service to rural areas or would prevent maximum expansion of service to the areas."

We understand that a number of witnesses appearing before your committee, speaking principally on behalf of UHF station operators, have urged upon you changes in our national television allocation plan which, if adopted, would unquestionably accomplish exactly the contrary to the objectives set forth in the above-quoted resolution. We do not question the sincerity or good faith of those making the suggestions, but simply to state them makes it obvious that they would reduce existing television service to rural areas and would prevent expansion of such service. For example, we have in mind such proposals as to reduce the present limits of power; reduce the present limits of antenna heights; reduce the presently required mileage separations between television stations; and the confinement of television stations to their home communities.

We have been instructed to oppose vigorously any action by the Government contrary to the objectives set forth in the above-quoted resolution, and we intend to carry out these instructions.

We request that you make this letter a part of the record of the hearing now being held by your committee.

Respectfully,

HERSCHEL D. NEWSOM,
Master.

ITEM 4 (B)

NATIONAL COUNCIL OF FARMER COOPERATIVES,
Washington, D. C., March 8, 1956.

Hon. WARREN G. MAGNUSON,
Chairman, Committee on Interstate and Foreign Commerce,
United States Senate, Washington, D. C.

DEAR SENATOR MAGNUSON: We have noted with considerable concern some of the views expressed during the hearings currently being conducted by the Committee on Interstate and Foreign Commerce relative to proposals directly affecting television broadcasting.

The National Council of Farmer Cooperatives wishes to take this means of registering with the committee its strong protest against any action by the Government which in any manner would reduce existing television service in rural areas, or which would prevent further expansion of television service in the future.

The National Council is a national organization of farmers' marketing and purchasing associations which represents some 5,000 farmer cooperatives serving a membership of nearly 3 million. The council for many years has recognized the dependence of farmers upon radio, and more recently upon television, not only as a source of entertainment but also as a working tool which makes available to them timely reports on weather and market conditions and other valuable information needed in efficient farming operations. Since the range of television broadcasting is more limited than that of radio, television service to rural areas is even more restricted than radio service. For this reason, we vigorously oppose any actions which would reduce this service; and we strongly urge, instead, that the committee give consideration to steps which will improve rural television service.

On a number of occasions in the past, the National Council has testified before or has filed statements with the committee. Our special interest in communications stems from the fact that the people we represent live in small towns and rural areas. Because they are more isolated than urban residents, their need for the best possible communications service is substantially increased.

While our interest in adequate television service for rural areas is deep rooted and we have some understanding of the general principles of broadcasting, we lay no claims to being experts in the technical aspects of broadcasting. It is apparent, however, that some proposals advanced to the committee and also to the Federal Communications Commission would result in depriving many farm people and small-town residents of some of the television service which now is available to them. It appears such proposals also would hamper the most equitable distribution of television service in the future.

Any congressional or executive agency action which would deprive the Nation's farmers of badly needed television service in order to bring additional service to large urban centers would not be in the best interest of agriculture. We respectfully recommend that members of the committee keep uppermost in their minds the needs of those farmers who are relatively far removed from other sources of information and entertainment and who, therefore, deserve the best possible television service on the most economical basis.

We request that this communication be made a part of the record of this hearing.

Sincerely yours,

HOMER L. BRINKLEY,
Executive Vice President.

(NOTE.—Item 5, as indicated, is printed at p. 1054.)

ITEM 6

MARCH 2, 1956.

Hon. WAYNE L. MORSE,
United States Senate,
Washington, D. C.

We, the undersigned, all residents of the community of Scottsburg, Oreg., wish you to continue in your position for licensing or regulation by the Federal Communication Commission of the various community flash television systems, similar to our community system.

By voluntary contribution we have erected an antenna, and purchased and are operating a booster unit, which rebroadcasts the TV programs. Our system has been inspected by a FCC representative, who stated that our present method is the only way we could have television in Scottsburg. He further stated that the FCC is contemplating increasing the frequencies into the 70 and 80 category, which change would eliminate our reception, since our system can only operate on a low frequency, we having to convert from a 13 down to a 3 frequency.

The population of the Scottsburg area, able to be served, is about 400, and since the operation of our community flash system the sets number close to 200. Prior to the installation of the system there were but 14 sets in the area.

75589—56—pt. 2——22

Our situation is identical to numerous other small communities through the State, and probably the Nation, which can only avail themselves of television by utilization of the type of equipment we are operating. The neighbor towns of Drain and Elkton are receiving television via flash systems. If we are to be deprived of such privilege through Federal regulation, we will have lost television indefinitely.

Any further information desired will be readily and eagerly furnished.

Members of Scottsburg Community Television (represented by Howard Ruben, R. B. Smith, Scottsburg, Oreg.): Clarence W. Miller, William Juniewicz, Robert Parsons, Robert J. Jackson, Edwin J. Romberg, R. J. Dietrich, J. B. Tharp, Althea Priem, Mrs. Dale R. Waddell, Mrs. Merle Vertheen, Mrs. Harvey Bishop, Mrs. Henry Priem, Edward H. Stauffer, Jack Galinger, Kenneth H. Thayer, Claude Jorgeneen, Merle R. Vertheen, Paul Winters, Chas. M. Cory, Mrs. J. G. White, S. B. Hendrix, N. F. Krebs, Paul W. Jackson, Carl B. Wilcox, S. G. Robbins, Howard Reuben, Dorothy Workman, W. R. McDonald, Arlene L. Cook, Andy J. Mackey, Eunice Hedden, Mrs. Lee Mathews, Fannie L. Smith, R. B. Smith, Art Smith.

ITEM 7 (A)

THAMES BROADCASTING CORP.,
New London, Conn., March 5, 1956.

Senator WARREN G. MAGNUSON,
Chairman, Committee on Interstate and Foreign Commerce,
United States Senate, Washington, D. C.

MY DEAR SENATOR MAGNUSON: I am extremely grateful for your kind letter of February 13.

Because of a recent illness, I have been away from my office and will be unable to attend the current hearings to which you made reference.

The purpose of my letter to you, dated March 30, 1955, was to point up the multiple failings and gross inadequacies of the existing television allocation. In reviewing that letter, I find that its contents are as applicable today as they were at that time.

However, all of us within the industry have taken heart from your own unflagging efforts to effect remedial action, and there is mounting hope that at long last a new or greatly modified allocation will be a direct consequence of the present hearing.

In lieu of personal testimony, may I humbly request that my letter of March 30, 1955, be entered into the official records of the current hearing?

And, once again, please accept my thanks for your attention and for the sincere effort you are making to establish a fair, feasible, and farsighted television allocation to correct the inequities, physical faults, and myopic limitations of the present allocation.

For your convenience, I am enclosing a copy of my original letter.

Respectfully submitted.

LEO B. KEEGAN,
Commercial Manager.

THAMES BROADCASTING CORP.,
New London, Conn., March 30, 1955.

Senator WARREN G. MAGNUSON,
Chairman, Committee on Interstate and Foreign Commerce,
United States Senate, Washington, D. C.

MY DEAR SENATOR MAGNUSON: As chairman of the committee investigating various phases of our industry's ills, you are doubtless being buried under a barrage of material concerning the UHF question—pro and con. At the risk of adding further to your mail burden, I wish to comment on the recent editorial contained in the March 14 edition of Broadcasting-Telecasting, entitled, "Another Freeze." Such an article might well go unnoticed and unchallenged, except that this magazine poses as the industry's leading publication, and some of the remarks made seem calculated to scare certain individuals and groups which are vitally concerned with the problem.

The following statements in this editorial are open to argument:

The statement

1. "It should be evident that neither UHF nor VHF, standing alone, can provide optimum, saturation, service."

The argument

While it is true that VHF, standing alone, as it is presently allocated, cannot render such service, it has never been proven that VHF, with proper mileage separations, directional antennas, low-power transmitters, etc., cannot do the job—or at least, a much better job than both VHF and UHF are now doing.

The statement

2. "The FCC should forget about schemes that would artificially curtail or eliminate service. The 'public-interest' yardstick should be reason enough."

The argument

In the light of present-day conditions (not applicable when the present allocation was conceived), serious doubt exists as to whether the public interest is being served, presently, by the existing VHF allocation.

The statement

3. "More than two dozen (VHF permits) previously authorized have been turned back. The reasons are economic. And so it is with UHF."

The argument

This tendency to compare UHF economic difficulties with VHF financial troubles hardly deserves an answer. The theory that the two are in any way comparable was expunged, very effectively, during the Potter subcommittee hearings last year. Only the completely gullible, or the wholly uninitiated, could still subscribe to this theory. (And Sol Taishoff falls into neither of these two categories.)

The statement

4. "And so it is with UHF. There are quite a few UHF stations that not only are not complaining, but wish the breast beating would cease. They are doing well even with VHF competition." * * *

The argument

One cannot help but wish that these UHF stations which are doing so well, would come out into the open. Best available information seems to indicate that, for every UHF breaking even, or better, there are 10 UHF's in the red. Most UHF operators hope for a better fate for UHF, through new rulemaking, or legislation, or both. But, how long can UHF, as a whole, survive, on this structure?

The statement

5. "First Storer, and now NBC acquires its second UHF station, while CBS is surveying the field for its second. This certainly supports the theory that UHF is technically adequate."

The argument

The acquisition of 1, or 2, UHF stations, by the big powers is not, per se, indicative of an improved future for UHF. Many specious explanations might be advanced for their sudden interest in UHF. Suffice to say, however, that, if a millionaire possesses 5 Cadillacs, 6 Packards, 4 Lincolns, and 2 yachts, he might not be adverse to acquiring a hot rod, for his backyard.

The statement

6. "Meanwhile, the FCC would be well-advised to stick to its assigned task of allocating channels, both VHF and UHF, consistent with the demand and with its rules."

The argument

This contention that everything should be left as is, and the present allocation unchanged, or never modified—in short, a "status quo is, of course, the nub of the whole question. This theory is not, necessarily, in the "public interest," but is definitely in the interest of the networks; the big magazines and newspapers; and the big equipment companies, who collectively control 75 percent of the existing VHF stations.

The statement

7. "It is not the function of Government to wet-nurse citizens who venture into unfamiliar fields unprepared to weather the red-ink stretch, as did all of the pioneer VHF's. Broadcasting epitomizes free, competitive enterprise, and the risks it entails."

The argument

That a publication which ostensibly represents the entire broadcasting and telecasting industry could present such as unilateral argument as this, couched in such unsavory language, is hardly commendable. Further, the assumption that all UHF station owners are in "unfamiliar fields" just isn't so. Unless, of course, you completely segregate the television industry from the radio industry. In a sense, all television station owners are in "unfamiliar fields," since the industry still is less than a decade in age.

Far be it from this writer to suggest any course of action to the FCC, as does Broadcasting, or to any individual, such as yourself.

Simultaneously, certain truths anent the television industry, are self-evident, such as:

1. UHF as a whole, was a failure in 1953.
2. UHF as a whole, was a failure in 1954.
3. Judging by the mortality rate, UHF still is a failure in 1955.
4. It will also be a failure well into the foreseeable future, under present conditions.

Measures, such as "all channel sets," "pay-as-you-go" TV, tax-free legislation, etc., all come under the heading of "partial helps" and, also, I fear, "Too little, and too late."

Actually, and frankly, there is no overall cure or even any effective remedial help, in sight for UHF. For this reason, it would seem only logical to point out that the present VHF allocation should not be considered an an unchangeable assignment—nor a pattern to be unmarred by modification.

In justice to everyone, continuing consideration should be given to the following VHF changes, consideration commensurate with the past, present, and future, mortality rate of UHF stations:

1. Lowering of mileage standards for cochannel, and adjacent-channel, VHF stations.
2. Directional antennas, where necessary, to bring this about.
3. Adjustment of power, and adjustment of antenna heights, where necessary, based on present-day conditions.
4. Serious, continuous consideration for use of certain FM bands for TV; conversion to be based upon practical, realistic, application of these bands, in the light of present-day conditions, consistent with the public interest.

It is understandable, of course, that any proposal to change, or modify, the present VHF allocation, runs afoul of powerful financial opposition. One has only to bear in mind the ownership of the present VHF station lineup, to realize that the job almost seems insurmountable. Nonetheless, it is a decision that will have to be made—this year, next year, or some year—when Congress will, at long last, feel the moral obligation to establish a truly competitive television industry in this country.

As of late last year, the VHF station lineup shaped up, thus (some changes have taken place since then, but these do not alter the general VHF alinement):

1. Excluding Texas (left out because its vast terrain, and large number of VHF stations, throw the whole picture out of focus) only about 60 stations (in 47 States) were privately owned. All the remaining VHF's were owned by one of the following groups:
   1. NBC.
   2. CBS.
   3. Big newspaper or big magazine publishers.
   4. ABC-Paramount.
   5. Dumont network.
   6. MBS.
2. Of the approximately 60 stations listed above as privately owned, the following owners were included:
   1. Westinghouse.
   2. General Electric.
   3. Philco (has since disposed of its VHF properties).
   4. Stromberg-Carlson.

The conclusion? Just about 75 percent of the VHF stations in 47 States were owned by big corporations which collectively control all 4 networks, many large newspapers, and most of the communications-equipment companies.

Speaking of public interest, do you think that, if the public were ever really aware of this situation, there would not be a public clamor?

In short, may I humbly suggest that—

(1) Weighty, continuing consideration be given to the UHF plight.

(2) The door to a possible new VHF allocation, or possible modification of the present allocation, not be slammed shut.

It is not a question of the country, or the advertising industry, being unable to support more television stations. The ever-increasing millions of advertising dollars annually pouring into the television industry—now in its second billion annually (time and talent)—prove beyond doubt that the country, the economy, and the advertising industry could well support over a thousand television stations—provided, of course, there is some fairness to the allocation, and adequate power and engineering are made available to all.

It is a sad commentary to relate that America, with the world's strongest economy, the world's No. 1 advertising industry, and, what should be advertising's strongest medium—television—is able to adequately support only a few hundred television stations. It is a matter of simple mathematics to realize that countless thousands of workers—television station employees, and agency folks, additional network people, writers, actors, and others—are being denied a livelihood in advertising, solely because the big interests block any and all attempts to challenge the present VHF allocation.

Respectfully submitted.

LEO B. KEEGAN,
Commercial Manager, Station WNLC.

ITEM 7 (B)

WFAM–TV,
Lafayette, Ind., March 8, 1956.

Senator WARREN G. MAGNUSON,
Chairman, Interstate and Foreign Commerce Committee,
United States Senate, Washington, D. C.

DEAR SENATOR MAGNUSON: While I did not testify, I did attend the UHF-VHF hearing before your committee on February 27 and 28, and, according to our understanding, all of the information and all of the witnesses' testimony would be sent each of you gentlemen for study and action.

We are a UHF station owner and have been in operation since June 1953. We feel that the FCC encouraged us to go into this business, and we feel also that they should offer recommendations and encouragement of the continued operation of the UHF spectrum, its use making possible the only complete national television coverage for the United States today. Without it, we will find a monopolistic, high-powered, high-towered situation similar to that of the WLW AM station when they operated at 500,000 watts in Cincinnati and were reduced to 50,000 watts in 1938.

We urge your committee to bring pressure to bear upon the FCC to see that a definite and reasonable solution is offered to the faithful UHF operators who have invested their life savings and struggled with this medium for 2 to 3 years with no return or even a word of encouragement from the FCC for the last 2 years.

Very truly yours,

O. E. RICHARDSON, *President.*

ITEM 8

STATEMENT OF STEWART WATSON, PRESIDENT OF MONONA BROADCASTING CO., PERMITTEE OF TELEVISION STATION WKOW–TV, MADISON, WIS.

I am president of Monona Broadcasting Co., which operates television station WKOW–TV on UHF channel 27 in Madison, Wis. This statement is being filed in order to document this record with further proof of how the Federal Communications Commission is shuffling its processes so as to favor the VHF stations, and so as to kill off the UHF by delay, by inaction, and by the use of administrative sleight of hand.

Monona Broadcasting Co. was formed in 1946 in order to provide the people of Madison and the surrounding area with a new outlet for local self-expression and for advertising through radio. We are composed of over 100 stockholders, over 95 percent of whom reside within our service area. Not one of us owns more than 11 percent of the stock of this company. We are justly proud of the radio service which we have made available to our community and area since the formation of Monona Broadcasting Co.

In 1952, we applied for and received a construction permit for UHF channel 27 in Madison. We made the application based upon our understanding that UHF and VHF stations could coexist in the same community. We based this understanding upon the expert opinion of the Commission to this effect, as explicitly stated in its sixth report and order. We built our station expeditiously and we have been on the air since July 9, 1953. We believe that we have rendered an excellent service to Madison and to its surrounding area. We base this belief upon the acceptance of our station by the viewers, by the community service agencies, and by the advertisers.

Early in 1954, it became evident through the cessation of operation of many UHF stations throughout the country, that the purported competitive quality of UHF and VHF stations was not actually feasible. This was proved beyond peradventure of doubt by the voluminous testimony and evidence presented to this committee in hearings before Senator Potter's Subcommittee on Communications. We, therefore, in August of 1954, petitioned the Commission to "deintermix" Madison by allocating VHF channel 3 to the educational station, and by making the educational channel commercial. It should be noted that we did not propose the deletion of any channel from the area—nor did we lessen the number of channels from which service could be obtained. This proposal, we told the Commission, would place all three of the commercial UHF channels upon an equal competitive basis. It would permit all three to compete for the viewer, for the advertiser, and for a network on the basis of service and of excellence of performance. Our petition was denied by the Commission on the grounds that applicants for the VHF channel had already spent time and money pursuing the assignment. The effect on the area, and on the public interest, was not even considered by the Commission in denying our petition.

Shortly thereafter, this committee again considered the plight of the UHF stations and its minority counsel indicated the need for exploration of all avenues in order to assure a nationwide competitive television system. Selective deintermixture was one of the methods suggested and the committee's counsel pointed out to the Commission that private interest considerations alone were insufficient to preclude the adoption of such relief.

In February of 1955, we resubmitted our petition to deterintermix Madison. This time the Commission initiated rulemaking proceedings looking toward the deintermixture of Madison, and requested us and the opponents to the proposal to produce voluminous evidence on all of the pertinent points involved.

We went through a long, involved and expensive proceeding. We submitted to the Commission evidence concerning the beneficial effects of deintermixture. We proved to the Commission, through competent evidence, that no area would be deprived of television signals should the deintermixture proposal be adopted. We committed ourselves to increase the height of our antenna and the power of our signal in order to fill in any possible gaps in service, should the area be deintermixed.

Many months after the hearings were concluded, the Commission issued a decision which refused to pass upon the merits of our petition. At the same time, we were shunted off into still another proceeding where, allegedly, our proposal would be considered again. This proceeding is still pending and the date of its determination, in the words of the chairman before this committee, cannot be foretold. However, in the intervening period, the Commission granted the pending application for VHF channel 3 in Madison, thus opening the way for immediate intermixture of the Madison area.

The effect of such an action upon the public interest was pointed out in detail in the proceedings before the Commission. The effect of intermixture need not be detailed again before this committee. The story has been told too often and too forcibly to require repetition. As a practical matter, while continuing to delay and to stall, the Commission effectively dug the grave for UHF service in the Madison area. In addition, it has clearly indicated to this committee and to the television industry that it is more perturbed about the private interests of VHF applicants than about the type of service to which local communities may look forward to obtaining, and to means which would lead to the fulfillment of a national competitive television plan.

Specifically, I would like to answer one statement made by Commissioner Doerfer to this committee. The inference was raised that in Wisconsin some 50,000 people might be deprived of television service if the VHF grant in Madison were not made. We have presented specific facts to the contrary. We offered to the Commission to make a house-by-house canvass of the areas in question in the event the Commission was not satisfied with the studies already completed. But all this to no avail. Our proof has not been considered by Commissioner Doerfer, and obviously he is willing to make an unsubstantiated prediction in the face of the evidence of record, and despite the reluctance of the Commission to rule upon such record.

We have taken every possible step open to us to have the Commission consider the effect of intermixture on the Madison area. We allege, and we are ready to prove, that this effect is detrimental to the public interest. We are fortunate in that, in this instance, the public interest, and our own private interests, coincide. But the action we urge be taken by the Commission is not in order to preserve our position, but in order to meet the overall public needs.

We are in court at the present time in the pursuance of this effort. We feel that it would not be proper for us to attempt to try the pending court case before this committee. This we are not trying to do. We are merely presenting to the committee additional evidence of the Commission's willful disregard of the public interest while it pursues its own bent to aid the already powerful VHF interests to the detriment of the public good.

I respectfully request this committee to require the Commission to take prompt action upon the needs of the viewing public, while there still is some possibility that UHF and all that it represents may be saved. I request this committee to admonish the Commission to preserve the status quo in Madison until such time as the Commission has made its final decision as to what action it will take with respect of the allocation of television channels. To do otherwise is to prejudge the very matters the Commission is allegedly considering in the pending rule-making proceedings.

The Chairman of the Commission once advised the committee that the Commission would take no steps which would further confuse the intermixture question. The Commission has not lived up to those representations. It is respectfully submitted that, unless the Commission does so, UHF will be dead and any prospect for a nationwide competitive television system will have died with it.

Senator Pastore. Our first witness this afternoon is Mr. John Englebrecht, WTVK, Knoxville, Tenn.

You may proceed, Mr. Engelbrecht.

STATEMENT OF JOHN ENGELBRECHT, WTVK, KNOXVILLE, TENN.

Mr. Engelbrecht. Mr. Chairman and members of the committee, my name is John A. Engelbrecht. I am president of South Central Broadcasting Corp., owner and operator of UHF television station WTVK, Knoxville, Tenn.

My statement is in the form of this petition which I am submitting to this committee at the present time with the intent of saving time. I will summarize some of the details in connection with the statement rather than read it completely.

Senator Pastore. Well, let's do it this way, Mr. Englebrecht, if it meets with your approval. And I want to thank you for that consideration, because we have quite a number of witnesses. We will order that your statement be included in the record at this point in its entirety. And you may summarize your statement as you wish.

(The statement of John A. Engelbrecht follows:)

In submitting this brief statement for your consideration in connection with your investigation of UHF-VHF allocation matters, it is my hope that I can make clear to you the pressing problem of economic survival which confronts WTVK as a UHF station in a multiple VHF market where it must compete with two

VHF stations. The problem results from intermixture of one commercial UHF channel with two VHF channels. It is submitted that the inequitable situation which exists in Knoxville can be readily eliminated through deintermixture in accordance with any one of several proposals presented to the Federal Communications Commission .

Under the Commission's present table of assignments (sixth report and order) VHF channels 6 and 10 and UHF channels 20 and 26 (with 20 reserved for educational use) are assigned to Knoxville, Tenn. WTVK operates on UHF channel 26. Greater East Tennessee TV, Inc., owns and operates television station WATE on VHF channel 6. The Commission on January 13, 1956, released its decision granting the application of radio station WBIR, Inc., for a new stationon VHF channel 10. This station is not yet on the air. No application has yet been made for educational use of UHF channel 20.

UHF station WTVK, which commenced operation October 18, 1953, was acquired by my company on July 28, 1954, pursuant to Commission approval, after the station was in strained financial circumstances and was contemplating the cessation of operation. At the time of the acquisition of station WTVK, television station WATE on VHF channel 6 was the only other television station in operation in Knoxville. VHF channel 10 was involved in a competitive proceeding before the Commission. In acquiring station WTVK my company assumed a heavy burden of existing financial obligations in order to give the people in the Knoxville area a choice of a second television service in accordance with the allocation principles laid down by the Commission.

In addition, WTVK, at great expense, has made major improvements in its facilities by increasing the effective radiated power of the station to visual 316 kilowatts and aural 158 kilowatts, installing new transmitters and making other equipment changes. It has also constructed a large and modern studio and transmitter building. The establishment and improvement of station WTVK has cost in the neighborhood of a half million dollars. WTVK incurred this great expense for the purpose of providing the viewing public in Knoxville with the best possible program service and for the purpose of improving its competitive position.

Station WATE on VHF channel 6 is affiliated with the NBC network. WTVK has been, and is now, providing the public with CBS network programs and the substantial portion of its revenue is derived from this program source and the national spot adjacencies to such network programs. WTVK's experience in 18 months of operation in competition with VHF station WATE on channel 6 has demonstrated that UHF station WTVK with network program service can survive on a marginal basis against competition from 1 VHF, but this experience has also clearly established that WTVK cannot survive against competition from 2 VHF stations if it loses its present network program source to the second VHF station.

The following circumstances show the precarious position in which WTVK has been placed as the result of the Commission's recent decision granting a second VHF station on channel 10 in Knoxville. As I previously stated, WTVK has been carrying CBS network programs. In October 1955, CBS forwarded to WTVK for signature a regular affiliation agreement with a 6-month cancellation provision, which I executed and returned. In response to subsequent inquiries as to the status of the contract, I was advised that the contract was in line for completion of processing and would eventually be reached for acceptance. Upon release of the Commission's decision granting a new station on channel 10, I immediately discussed with CBS representatives in New York the present status of the contract and was advised that it was being withheld pending a review of the Knoxville market and a determination of the potentialities of having a VHF or UHF station outlet in the area. I was also advised that WTVK was not a CBS affiliate but could continue to carry network programs on a per program basis pending a final decision by CBS.

As far as is known, CBS has not as yet made its final decision. It may be appropriate for this committee, during the appearance of the networks in these hearings, to ascertain the policy underlying such affiliation decisions and the factors upon which such policies and decisions are based. I want it clearly understood that I say this not for the purpose of criticizing CBS, but for the purpose of bringing the facts before you so that you will know some of the critical problems confronting a UHF station in a multiple VHF market. My relationships with CBS have always been very cordial and I hope that they will continue that way.

In addition to NBC and CBS there is, of course, the ABC network. As of the present time, this network claims affiliation with station WATE on VHF channel 6 and is placing on WTVK only four programs, on a per program basis, that cannot be cleared on channel 6. Here, again, this committee may be able to ascertain and clarify during these hearings what the policy of ABC will be upon the commencement of operation of channel 10 in Knoxville.

WTVK has attempted time and time again to get the Commission to take action remedying the inequitable allocation in Knoxville by assigning a comparable and competitive VHF facility to the area for use by the station.

On October 28, 1955, WTVK filed with the Commission a petition requesting the Commission (1) to institute rulemaking proceedings looking toward the amendment of section 3.606 (b) of the rules by the assignment of VHF channel 7 to Knoxville, and (2) to issue appropriate orders to show cause why the outstanding authorization affected should not be modified to specify operation in accordance therewith. WTVK demonstrated that with two VHF stations in operation, Knoxville will become predominantly a VHF television market and that the Commission, itself, has recognized the impossibility of continued and successful operation of a UHF station in the face of competition from multiple VHF stations. On November 10, 1955, the Commission by memorandum opinion and order (FCC 55–1126) denied WTVK's petition without consideration on the merits on the ground that it was instituting general rulemaking proceedings to consider amendments to its present television-allocation plan and rules on a nationwide basis.

As you know, the Commission on November 10, 1955, instituted a general rulemaking proceeding to consider amendments to its present television-allocation plan and rules on a nationwide basis (Docket No. 11532), and its notice of proposed rulemaking makes clear that deintermixture is one of the possible solutions to the problem before it and is to be considered in the proceeding. Complete deintermixture in Knoxville could obviously be effected by making the market an all-VHF area or an all-UHF area. The market could also be converted effectively from a predominantly VHF market to a predominantly UHF market by partial deintermixture reserving channel 10 for educational use and making UHF channel 20 available for commercial use.

On December 15, 1955, WTVK filed comments for consideration by the Commission in the general rulemaking proceeding. WTVK pointed out that plans suggested to the Commission have recognized the inequitable distribution of VHF channels in the large metropolitan areas and have proposed that VHF channels be used to provide at least 3 equivalent television services in as many of the top 100 markets in the United States as possible. WTVK urged that consideration of proposals in the proceeding would establish the need on a broad basis for the adoption of regulations in the public interest which would permit the assignment of a third comparable and competitive VHF facility to Knoxville.

An examination of the various comments and proposals filed in the general rulemaking proceeding indicates that a third VHF facility can be assigned to Knoxville through the adoption of some of the plans proposed. For example, the adoption of the proposals and comments filed by Columbia Broadcasting System, Inc., would make possible the assignment of VHF channel 8 to Knoxville. WTVK favors the adoption by the Commission of any plan which would make available for its use a comparable and competitive VHF facility.

Knoxville, Tenn., is the second largest market in the State of Tennessee and is located in a standard metropolitan area comprised of Knox, Blount, and Anderson Counties, for which the total population is 337,105. This area ranks 50th in population among all the metropolitan areas, and showed an increase in population from 1940 to 1950 of 37 percent. Within 20 miles of Knoxville, and consequently within the principal city coverage area of a Knoxville VHF station, is the community of Oak Ridge, a vital center of the United States Government's tremendously important atomic energy program. It is to be noted, also, that Oak Ridge is situated considerably closer to Knoxville than to any other major city in Tennessee. The population figure for Knoxville, Tenn., does not include the population of Oak Ridge, which in 1950 was 30,229, or the urbanized area outside of the city which contains an additional population of 23,397 (Census of Population, vol. 1, pp. 42–19, 42–21). In its Sixth Report and Order, the Commission recognized that geographic, economic, and population conditions vary from area to area and must be considered in assigning channels, and stated that in arriving at an equitable distribution of assignments throughout the country, consideration must be given to "population as one of the important criteria for distribution of assignments" (pars. 65 and 68).

A fair, efficient, and equitable distribution of available frequencies, in accordance with the mandate of section 307 (b) of the Communications Act, requires that the Commission assign to Knoxville for use by WTVK a third comparable and competitive VHF facility for the purpose of serving the substantial areas and populations involved.

WTVK has petitioned the Commission in the alternative that, if the television allocation plan and rules are not changed so as to permit the assignment of a third comparable VHF facility to Knoxville, the Commission recognize the impossible competitive situation confronting a single UHF station in a multiple VHF market and substitute UHF channel 20 for VHF channel 10 as a commercial assignment. Since channel 10 is still involved in litigation and no station has yet been constructed or operated on that channel, a substitution of UHF channel 20 for channel 10 could be made without injury to the successful applicant or to the public.

Another solution would appear to lie in the abandonment of the Commission's fixed table of television assignments. The table of assignments was adopted for the purpose of expediting the establishment of television service throughout the country. This objective has now been accomplished for the most part. The abandonment of the fixed table of assignments and the establishment of appropriate standards of service would result in sufficient flexibility to permit the use of either VHF channel 7 or 8 in Knoxville without disrupting the service of any existing station. The abandonment of the table of assignments would undoubtedly take care of the problem of deintermixture in a substantial number of areas throughout the country.

South Central Broadcasting Corp. recommends that unless the Commission has readily available a nationwide reallocation plan which would solve most of the problems involved, the committee require the Commission forthwith to take immediate action to make reallocations in the public interest on a case-to-case basis. Such action can be taken with reference to Knoxville and with respect to a large number of other areas.

This committee, of course, recognizes the need for immediate action.

Mr. ENGELBRECHT. In the statement we point out that WTVK, as a UHF station, is operating in a VHF market consisting of channel 6 with channel 10 to be built this year—it has been approved. It is still being contested by the other applicants. We are the second owners of this operation, the previous operation having failed. They sold it to us before going off the air.

We have managed to improve the property over a period of 18 months, increasing power and service. We are a CBS affiliate—or rather we are on a per-program basis with CBS at the present time—and we have managed to actually broadcast approximately 70 hours of network per week and approximately 30 on film and in live programing on a local basis. Our progress has been slow and painful in competition with a VHF operation, and it promises to be worse with the advent of the second VHF station in the market.

We have no assurance of what our network future might be, and we think, as we have explained in this statement, that we should make every effort to try to deintermix the market so that either we could have 3 VHF's, or 2 UHF's commercial and 1 VHF commercial.

Senator PASTORE. May I ask a question, Mr. Engelbrecht—and this is a matter that disturbs me no end—at the time that you made your application and made your purchase, Knoxville was already a mixed market?

Mr. ENGELBRECHT. That is correct, sir. At the time that we applied for the purchase of this station—applied for approval of our purchase of the station—it was back in the early part of 1954. The situation in respect to the competition between UHF and VHF and their facilities and their coverage and the service that they could render in a market such as Knoxville was not as evident as it is at the present time. In other words, we thought at that time that the market was a 3-station market and still believe that 3 competitive facilities would be successful in the market. However, we did not realize at the time that a UHF facility was not competitive to a VHF.

The result is that our problem lies largely with the matter of being able to sell the national advertisers and continue our network affiliation.

Senator PASTORE. Well, now, your second V has not gone on the air as yet. Have you objected to that grant?

Mr. ENGELBRECHT. No. We have not filed a formal protest trying to get a stay of construction. We have not done that. What we have petitioned for is that the market be—that in the market we be given a comparable V facility, either 7 or 8, or whatever would work, or that channel 10 would be reallocated to education, and that channel 20 which is presently allocated to education be assigned to them for commercial use.

We believe this: That as a U in competition with one V we could be successful, and we are at the present time.

Senator PASTORE. Let me ask you this: Do you have as much coverage with your U as the present V in your locality?

Mr. ENGELBRECHT. No, sir.

Senator PASTORE. And will the new V reach as far as the existing V reaches now?

Mr. ENGELBRECHT. Not quite.

Senator PASTORE. You mean it will have less power?

Mr. ENGELBRECHT. No, sir. The present V in the market is channel 6 with a hundred kilowatts on, I would say, about a thousand foot above average terrain installation. The new V going in is an upper band VHF on channel 10 with 316 kilowatts. There will be a very close—it will be very close in there as to the total coverages according to engineering standards, but they may not be the same, or are not going to be quite the same.

Senator PASTORE. Essentially, your desire is to change your own station to V rather than to stop this other channel—what did you call it—channel what?

Mr. ENGELBRECHT. Channel 10.

Senator PASTORE. Yes—rather than stop from coming in?

Mr. ENGELBRECHT. We do not propose to lessen the service in the market. What we want to do is make a competitive service in the market. The market is such that two stations would hardly serve the local advertisers, because of the potential volume of business that might go in there. It has ranged somewhere around 54th nationally as a market—that is, according to J. Walter Thompson's figures of 1951.

Senator PASTORE. What is the extent of the conversion in your community?

Mr. ENGELBRECHT. Conversion in the immediate city, or immediate area around the city, was surveyed by the ARB people—American Research Bureau—and in the spring of 1955 showed approximately 89 percent conversion. That was in the home county. Now, at that time the plant was operating with 21,000 watts of power. At the present time, since January 21, we have been operating with increased power trying to reach a larger area and serve a bigger market. I would guess that the outlying counties do not have nearly as much conversion in them as in the home county. I am sure there is not.

Senator PASTORE. But in the home county you say about what?

Mr. ENGELBRECHT. About 89 percent, which is an indication that if a station has programing, and they have no choice of other facilities to see it on, that there is a very good chance of making an operation successful in spite of some of its limitations on coverage, or the costs that might be incurred in trying to convert to the use of that facility.

Because it means that they have got to spend a little more money for their tuner, a little more money for their antenna installation. It means that the public, in order to enjoy UHF service, would spend a small amount of extra money which they normally would not spend unless there was a service that they could enjoy or wanted.

Senator PASTORE. Have you any apprehension that your relationship with CBS would change if channel 10 comes in?

Mr. ENGELBRECHT. In my statement here I discuss that problem. When we bought the plant, there was in existence a letter of understanding, or a form of contract, which expired in October of 1955. In September of 1955, we received from CBS station relations a letter which said they were enclosing a network contract for our signature—an affiliation agreement with a 6-month cancellation privilege. This we signed in the latter part of September and returned to CBS. We waited a month or two for our copy to come back, and it did not come back to us. Then we made some inquiry as to what had happened. We were advised that the contract was in line for completion of processing, and it might be a little time before we eventually reached acceptance.

There was no indication that it might be turned down. However, upon the completion of the Commission's decision granting a new station on channel 10, I went to New York the following week and discussed our affiliation relationship at that time and was told that our contract, which had been signed 4 or 5 months previous to that by us, was still withheld pending a review now of the Knoxville market and a determination of the potentialities of either a V or U facility for CBS in the market. At that time I was also told that we were no longer an affiliate and were on a per program basis with CBS.

I say here that the final decision has not been made and it might be appropriate for this committee to ascertain the policy underlying such affiliation decisions with the network and the factors which determine those affiliations. I am not doing this for the purpose of criticizing CBS but to bring the facts before the committee and perhaps solve the problems in our market and other markets of similar nature.

Senator PASTORE. We know precisely what you mean and what your relationship is and what your fears are. But your case is somewhat different from some of the others that we had for the reason, as I have already brought out, that apparently at the time you purchased your station you knew it was a mixed market and there had already been an allocation of an additional V station which had not been yet assigned.

Mr. ENGELBRECHT. The situation was exactly the same as it had previously been with the previous ownership who had applied for it. I do not know whether it is unfortunate, or a matter of judgment in our buying of the property from those people, that we did not at the time show any better realization of the problem than they did.

The one thing we did determine in our mind before going into that market was that there existed a good, growing future market for television and radio. We want the expansion, and we looked at it from the standpoint of the opportunity that existed in the service in that community. I still believe that 3 competitive facilities with 3 competitive networks would be economically sound, and it would better serve the public interest.

Senator PASTORE. Provided they were all V?

Mr. ENGELBRECHT. All U's might be the answer.

Senator PASTORE. What are you going to do with the 11 percent who have not converted? How are you going to compel the viewer to sustain responsibility for this scrambled mess?

Mr. ENGLEBRECHT. I am not advocating that as a decision other than to say this: I think that when you have to take the total general interest of the public as a whole, there I think it would better serve the general interest to have 3 properties there, regardless of whether it is all U or V or 2 U's and 1 V, than it would be to have only 2 V's in the market because of the limitations that it would impose upon the amount of service that you could render in that community.

The community is right in the valley between the Smoky Mountains and the Cumberland Mountains, and it is fairly rough terrain. At the top of that valley is Johnson City, with a CBS service primarily but with some other network facility, too. At the bottom of that valley is Chattanooga, with CBS and some secondary service. Knoxville sits in the hub of that thing.

The service that comes in there is from those two ends of the valley. I think there is going to be plenty of coverage of the outlying portions of the metropolitan area from many sources. But in the area of Anderson, Knox, and Blount Counties—which is Oak Ridge, Alcoa, and Maryville, and the city of Knoxville and Fountain City, which is a market of 337,000, or perhaps a half million people when you take in Oak Ridge and some of its outlying environs—your need for a third facility is very definite. First of all may I point out this: We are today operating in competition with a V at a rate card, nationally, of $250. Their rate card goes to $600 the 1st of April. I do not think there is any question that two V's in that market could share rate cards of $600, without too much problem of charging that rate.

Now, we do not find it easy to do business at half the operating charge of our competitor. But let's say that we are showing a small profit at the present time, which is being used on a local basis. Now, our revenue has been as much as 35 or 40 percent from the local market. I would say that our number of advertisers locally is greater than that of the V station in the market.

Senator PASTORE. These arguments that you are making now, have they ever been formally presented to the Commission either in a petition or a protest?

Mr. ENGELBRECHT. Trying to present economic arguments in the form of a petition has not been, I think, too successful. I don't know.

Senator PASTORE. Well, I mean have you ever appealed in any way to the Commission itself and presented these arguments?

Mr. ENGELBRECHT. Our applications and petitions have been directed, I think, toward that end without specifically just saying that.

Senator PASTORE. But I mean you have filed a petition seeking deintermixture. Have you made these arguments that you are presenting here now, more or less?

Mr. ENGELBRECHT. Yes, sir.

Senator PASTORE. And has any decision been made by the Commission?

Mr. ENGELBRECHT. Well——

Senator PASTORE. Was your petition rejected, in other words?

Mr. ENGELBRECHT. Our petition was rejected without consideration of its merits, as a part of a group. The problem is one that they have thrown into a general rulemaking proceeding. And the problem of getting into that is, of course, one of time.

Senator PASTORE. I am not quarreling with you. I am trying to establish the record, that is all, as to whether or not this has been called to the attention of the Commission for their consideration. Of course you realize that this committee cannot decide what community is going to get what kind of station. I mean that is an administrative function that has to be determined by the Commission itself.

Now, I am wondering if the facts that you are presenting to us today have already been presented to the Commission for their consideration—whether they are going to consider it on a selective basis or whether they do it on a nationwide scale. I am wondering whether or not they have the information that you present here now?

Mr. ENGELBRECHT. Well, we have——

Senator PASTORE. And your answer is in the affirmative?

Mr. ENGELBRECHT. My answer is in the affirmative, because what we have said is that there are several plans that advocate changes for the Knoxville market. CBS has advocated, in their plan to the Commission, adding channel 8, with some difference in spacing. ABC has advocated channel 8 for the market in the place of channel 26.

We have said that we would support any plan that would provide a competitive facility in the market, and that if that were not possible, we would suggest that 2 commercial U's with a change of channel 10 to education would probably work better than to have 2 commercial V's and 1 commercial U.

Senator PASTORE. Are you competent enough to say whether or not that particular locality, technically, can be made into a three-V station area?

Mr. ENGELBRECHT. I am not an engineer; however, I am familiar with the engineering problems. On channel 7 in order to get the minimum spacing as proposed in the Sixth Report and Order, it would necessitate moving channel 7 from Spartanburg to either Columbia, S. C. or Augusta, Ga. In that manner, you could put 7 into Knoxville and into a different city in South Carolina or in Georgia, thus getting a greater usage of the frequency.

Channel 8 is now in use at Nashville with WSIX–TV. The spacing there would be just a little less than the minimum spacing provided in the Sixth Report and Order, and could probably be worked out with a directional antenna or a lowering of the power, especially since there is very rugged terrain between Nashville and Knoxville, which is the Cumberland Mountains. I think one or both of them are possible in the potential.

Senator PASTORE. Now, has that been presented to the Commission?

Mr. ENGELBRECHT. That has been, yes.

Senator PASTORE. Your answer is in the affirmative on that?

Mr. ENGELBRECHT. Yes, sir.

Senator PASTORE. Let me ask you this question: With the existing V station and your U station now, are you making money or losing money?

Mr. ENGELBRECHT. We are making a profit, sir, and have for some months.

Senator PASTORE. And if the channel 10 station comes in—if the new V comes in—with two V's and the one U that you are running now, what do you expect your prospects to be?

Mr. ENGELBRECHT. Of course, part of that is based on the problem of network affiliation, so I will have to answer it two ways. Without the proper network affiliation, with its programing and its revenues and its adjacencies to the sell, why I might as well say that the business would fail. There would be no reason to expect that it will continue to operate channel 26 in a satisfactory manner.

Senator PASTORE. As far as I am concerned, your presentation is now complete. Are there any questions?

Senator PURTELL. I would like to ask 1 or 2 questions. No. 1: I was interested in hearing you say, sir, that you have 89 percent conversion there.

Mr. ENGELBRECHT. Right.

Senator PURTELL. Which in many areas would be considered satisfactory to ultrahigh operators. Obviously, then, your problem is not one as to a listening audience, if they wish to listen—is that correct? They have the sets to listen to your station or to the very high stations—is that correct?

Mr. ENGELBRECHT. That is correct, in the immediate metropolitan area. During the present period we are expanding that listenership into the rural areas which we did not serve previous to our increase in power; but given a period of time, it would be correct, sir.

Senator PURTELL. If you have 89 percent conversion there right now, where your listeners can listen to your programs or the programs from the other existing operating station, and you anticipate another station will come in, would your position be much better off if you had a very high and you had 3 stations operating? Would your problem not be one of network affiliation then?

Mr. ENGELBRECHT. Certainly we would have some problem of network affiliation—except that our opportunity for network affiliation would be much better.

Senator PURTELL. With 89 percent conversion you have got pretty high conversion right now; haven't you?

Mr. ENGELBRECHT. In the immediate market.

Senator PURTELL. But you tell us in the fringe area there is much overlapping there—is that correct?

Mr. ENGELBRECHT. Quite a bit.

Senator PURTELL. So, actually, the amount that you might enjoy of that market is a question; isn't that right?

Mr. ENGELBRECHT. Well, of course, the decision is not ours. In other words, what we think and what we think the network should believe are two different things.

A rejection of a U over a V by the network in certain markets is something that we do not control. In other words, even if we advocated the network's continuing with us—saying that this exists and that exists and we think that they should because of this potential—that does not mean that necessarily they are going to agree with that, in service and coverage.

The market is a pretty rough terrain. The area down there is geographically quite rugged, and there are definitely going to be certain shadow areas. And there is a lot of argumentation to show that perhaps even with 316 kilowatts e. r. p. in that market we are still going to be at a considerable disadvantage in comparison with a V service.

Senator PURTELL. The point I was trying to make was that usually the complaint from ultrahigh frequency stations that have come in before this committee is as to the lack of conversion—we have heard that repeatedly—and that was the reason they wanted deintermixture. Now, you tell us that is not a problem with you; that you have 89 percent conversion at the present. So where would deintermixture help you to the extent that it would appear that you think it might? Is it a question, therefore, of network affiliation?

Mr. ENGELBRECHT. I did not say that conversion was not a problem. I said that it was not as much of a problem as it was for other areas. I said we had a high percent of conversation, but even 11 percent disadvantage is a disadvantage—especially when you increase that disadvantage as you go out further in your area. But even so, I think that if we were able to keep a major network with a major portion of its schedule as a UHF in that market, there might be some hope of survival. The problem gets itself right down to the basic problem of being able to take in enough money and have enough programing so that you can afford to carry the operation until such a time as all these other obstacles are overcome—improvements in equipment, conversions, sales resistance, and other problems that exist with operation of a TV station.

Senator PURTELL. You have answered my question. Thank you. I have finished with my questioning.

Mr. COX. About these rates, Mr. Engelbrecht: Do I understand that the national card rate for your V competitor is shortly going to be $600 for an hour of class A time and that yours is $250?

Mr. ENGELBRECHT. That is correct. Presently on their AA time they have a $500 rate, and I have been told that that is increasing to $600 on April 1.

Mr. COX. Is it fair to say that the fixing of your rate has been in large part determined by the network?

Mr. ENGELBRECHT. No, I wouldn't say that. Our rate has been determined largely from what we could charge for it.

Senator PURTELL. Senator Pastore, I must go at this point. I am most anxious to be here when the other witnesses appear, and so I will come back as quickly as I can, Mr. Chairman.

Mr. ENGELBRECHT. Certainly the network has told us that; as a matter of fact, I approached them and asked them if they could consider changing our rate to $300 instead of $250, and they had that under advisement with that affiliation contract. I do not want to create the impression that they established our national $250 rate.

Mr. COX. What is your national spot rate?

Mr. ENGELBRECHT. It is the same.

Mr. COX. It is the same?

Mr. ENGELBRECHT. Yes, sir.

Mr. Cox. Now, applying your 89 percent of conversion in the metropolitan area, shading off somewhat as you go out further, what do you think is the ratio of the sets that you can reach to the number of the sets that your V competitor can reach?

Mr. ENGELBRECHT. First, I am going to say that there has been no survey that specifically covered that situation, so anything that I am going to say is based upon projected thinking or guesswork. Our competition in the market had a tele-pulse made during the month of December, prior to our increase in power. The circulation in the outlying counties as to listenership was rather disappointing to us. We have had county surveys or local telephone surveys made on some of our better programs such as Sunday evening and Tuesday—Ed Sullivan, $64,000 Question, CBS baseball on Saturday afternoon.

In the metropolitan telephone exchange we have at times been able to outdraw, in listenership, the V station. But when you take the total market and evaluate it as a sales potential for a national advertiser, and you get into the outlying counties, we are at a considerable disadvantage until this increase in power creates conversion and listenership and viewers.

Mr. Cox. As I understand it, even with your increase in power, your V competitor can cover somewhat more area than you can. Now, in that somewhat larger area, he can reach every set there because he has no conversion problem. The point I am trying to get to is this: In your best judgment, would you feel that he has a potential listenership—assuming he can get the programs to attract them—that is more than double yours?

Mr. ENGELBRECHT. We have felt that as evidenced by charging on that basis in order to be competitive—in other words, we have indicated that.

Mr. Cox. You think it is actually based on the facts as they exist, or on the facts as you think they are understood?

Mr. ENGELBRECHT. I think that the answer is both. I think I am influenced by the national advertisers' thinking and by the local advertiser as well as our own evaluation.

Mr. Cox. In other words, do you feel that if you got your rate up to $300 you would be receiving a fair competitive price for your time, because of your more limited audience?

Mr. ENGELBRECHT. I think so at the present time. However, I think that our increase in facilities may enable us to better that as we get more penetration into the outlying areas. In other words, I do not anticipate being able to reach a rate anywhere near their rate, but I do think we won't have to operate at, say, 40 or 50 percent of that rate.

Mr. Cox. If you eventually get 89 percent of conversion in the entire area that you can now reach, will that give you substantially 60 percent, say, of his audience?

Mr. ENGELBRECHT. I would think so; yes.

Mr. Cox. As I understand it, you feel that Knoxville, as the 54th market in the country, could support three stations if they are competitive, or even if possibly one of them were a V and the other two were U's?

Mr. ENGELBRECHT. Yes, sir.

Mr. Cox. But is it your position that if two V's are to be in the market that that substantially creates an artificial ceiling, so that no third station can exist there until a third V is made available to the area?

Mr. ENGELBRECHT. Especially if it is—qualifying it to say that that third station is a U and it is without network affiliation.

Mr. Cox. Isn't that normally the situation that the third station is in, that is, if is a U?

Mr. ENGELBRECHT. Yes, sir.

Senator PASTORE. A little bit on this rate fixing. At the time that you instituted your rate of $250—is that what you said it is?

Mr. ENGELBRECHT. It has been a rate that was established for the stations from the time it was——

Senator PASTORE. Established by whom?

Mr. ENGELBRECHT. It was established by the previous ownership and was continued by our ownership subsequently to that.

Senator PASTORE. But is the establishment of this rate made in consultation with the national network?

Mr. ENGELBRECHT. They may have discussed it with the network.

Senator PASTORE. I mean what is your relationship?

Mr. ENGELBRECHT. My relationship with the network is that I am trying to get an affiliation, and keep one, and that I would like to have the highest rate that they feel that they can pay us. I think that is being rather obviously blunt.

Senator PASTORE. You asked for the $300 rate?

Mr. ENGELBRECHT. I suggested they consider it.

Senator PASTORE. Whom did you ask it of?

Mr. ENGELBRECHT. Station relations.

Senator PASTORE. Of the network?

Mr. ENGELBRECHIT. Of the network; yes, sir.

Senator PASTORE. In other words, before you establish a rate, you have to take it up with the network and the rate you fix has to be satisfactory to the network? Now, that is a very simple question.

Mr. ENGELBRECHT. The national spot rate does not necessarily have to be the same as your network rate; no, sir.

Senator PASTORE. But whatever the rate is, it has to be agreed to with the network?

Mr. ENGELBRECHT. For the network rate; yes, sir.

Senator PASTORE. That is all I have. Thank you.

Mr. ENGELBRECHT. There is only one thing I said as a recommendation at the end of my statement, and that was that the South Central Broadcasting Corp. recommends that unless the Commission has readily available a nationwide reallocation plan which would solve most of the problems, that the committee here require the Commission to take immediate action to make reallocations in the public interest on a case-to-case basis. Such action can be taken with reference to Knoxville and in respect to a large number of areas. It is only in the form of a suggestion. And I certainly appreciate the opportunity of appearing before this committee.

Thank you.

Senator PASTORE. The next witness is Mr. John H. DeWitt, Jr.

Mr. ROLLO. My name is Reed T. Rollo. I am legal counsel for John DeWitt, the next witness. I have supplied counsel with copies of his prepared statement, and rather than take the time of the committee to have him read the statement, I would like to ask that it be incorporated into the record. Mr. DeWitt, however, is here and will be glad to answer any questions you may have.

Senator PASTORE. Without objection, that request will be complied with. We will have the statement inserted in the record in its entirety at this point.

(The statement of Mr. John H. DeWitt, Jr., is as follows:)

My name is John H. DeWitt, Jr. I am president of WSM, Inc., which owns and operates television station WSM-TV and standard broadcast station WSM in Nashville, Tenn. WSM-TV operates on channel 4 with the maximum effective radiated power of 100 kilowatts. We have a construction permit authorizing the installation of a 1,379-foot tower to be located in Nashville. WSM is a class 1-A station operating with 50 kilowatts of power. It commenced operation in October 1925, and WSM-TV commenced operation in September 1950.

My experience embraces both the managerial and engineering fields of radio and television broadcasting. I have been active in the engineering field since 1922, when I constructed the first broadcasting station in Nashville. I attended the Vanderbilt University School of Engineering and upon leaving there became a member of the technical staff of the Bell Telephone Laboratories in New York. I became chief engineer of station WSM in 1932 and retained that position until 1942. I entered the military service in 1943. In the service I was director of the Evans Signal Laboratory near Fort Monmouth, N. J., which directed ground radar development for the Army and Air Force. I am a fellow of the Institute of Radio Engineers and a member of the American Physical Society, as well as other scientific organizations. I have actively engaged in allocation matters before the Federal Communications Commission, and its predecessor, for many years.

In the managerial field, I have been active manager of station WSM since 1947 and of both WSM and WSM-TV since WSM-TV commenced operation in 1950.

THE IMPORTANCE OF UHF

Although I am here as a representative of a VHF station, I wish to make it clear at the outset that I consider the development of the UHF frequencies as being essential to full development of our television potential. Some seem to think of UHF as an entirely separate part of the television spectrum. Actually, it is simply an extension of a band which is now called VHF and which ultimately could be integrated so that when one thinks of television, one thinks of channels 2 through 83, inclusive, rather than UHF and VHF.

UHF has been pictured here as an inferior method of bringing television service to the people, but instead, it is merely not yet a fully developed means of extending the spectrum. So what we are talking about is a matter of degree rather than saying that one part of the spectrum is bad and the other good. As one goes up the spectrum, propagation effects develop gradually. As a matter of fact, there is a large jump in frequency between channels 6 and 7 in the VHF region, and between channels 13 and 14, even though many people who do not know the allocation structure think of these channels as being adjacent. There is little difference in the ratio between channels 6 and 7 in the VHF band, and channels 13 and 14 which is the jump between VHF and UHF. (Channel 6 is 82 to 88 megacycles, and channel 7 is 174 to 180 megacycles. Channel 13 is 210 to 216 megacycles, and channel 14 is 470 to 476 megacycles, a ratio of approximately 2 to 1 as compared with a ratio of 2.2 to 1.)

It is a fact that in hilly terrain the higher the frequency the poorer the coverage. On the other hand, there are some advantages of UHF over VHF which are not generally realized. There is less manmade and cosmic noise in the UHF band, so that a UHF picture is likely to be a cleaner picture than a VHF picture. Since it is much easier to construct a highly directional receiving antenna for UHF frequencies, it is much easier to eliminate ghosts in this band. It turns out also that with the development of high-power klystron tubes, it is easy to generate high transmitter power for transmission in the UHF band, and I believe it costs no more than equal power in the upper part of the VHF band.

There is a very close parallel to the VHF-UHF situation in the lower and upper parts of the standard broadcast band. Here, frequency, power, and soil conductivity determine coverage. There are 5-kilowatt stations in North Dakota operating on low frequencies which have far greater daytime coverage than 50-kilowatt stations operating on higher frequencies in other parts of the country. Generally, 1,500 kilocycles is far inferior to 600 kilocycles in point of coverage, and yet the economics have turned out such that some stations operating on higher frequencies are in better financial condition than ones operating on lower frequencies.

I have reviewed most, if not all, of the statements that have been submitted to you and I find that no one has said that there will be a scarcity of channels if the UHF portion of the spectrum develops. There will be plenty of channels available for hometown television. I find, also, that no manufacturer who has had experience in the development of UHF equipment has said from a technical standpoint it cannot be developed into a perfectly usable service. There seems to be no engineering disagreement on this point.

The economics of the present situation with regard to UHF are not too different from the situation in which VHF operators found themselves in the early days. Even WSM-TV, which is one of the latecomers in VHF, found it necessary to invest $200,000 in a microwave system to bring network service into Nashville from Louisville, and to lose a very large amount of money before the operation could be successful from an economic standpoint. The UHF operators must be willing to expend substantial sums in their initial installation in order to provide the coverage necessary to attract advertisers. For the present, it does not appear prudent for UHF operators to make the required investment except in markets of a size adequate to support a VHF station.

The real crux of the UHF problem is getting all-channel receivers into the hands of the public. Since it is not prudent from an economic point of view for a UHF station to operate in a smaller community and go through the expensive process of building up circulation, some other method must be found. My suggested solution is that VHF stations be permitted to install translators in smaller communities operating on UHF frequencies, thereby providing the public within the range of the translator stations with programing which will create the incentive to purchase all-channel receiving sets. We have almost an exact analogy in our experience with standard broadcasting. Clear channel stations operating in the larger cities of the country deliver the only receivable radio signals to many small towns and rural areas. These signals provided the incentive to people residing in these areas to purchase receiving sets. As the number of sets increased, it became economically feasible for radio stations to operate in many of these smaller towns, since they already had a readymade audience. A review of the history of the development of radio stations will confirm this.

PRESENT ALLOCATION PLAN

It is my view that an allocation plan is essential to proper development of a nationwide competitive television system. We shall obtain a much more efficient use of the spectrum by this method than we would by allocation on a case-to-case basis.

The plan embodied in the Commission's Sixth Report and Order is the result of years of study by experts of Government and industry and except for some possible minor modifications, should be allowed to stand.

Any allocation plan requires accurate propagation information on the frequencies involved. The present allocation plan of the Commission is based upon the best propagation information available and as knowledge is added with time, it may be possible to improve upon it.

A substantial amount of intermixture will, in my opinion, be necessary to develop fully the UHF channels. As I have already stated, there must be incentive for the public to acquire all-channel receiving sets. This incentive will be created in part by translators as I have mentioned, in part by high-power UHF operations, and in part by intermixture.

What is needed more than anything else at the present time is an affirmative expression of confidence in the future development of UHF. The pioneer VHF stations invested huge sums for plant investment and operated at substantial losses over a long period of time. They continued this operation, however, as prudent businessmen, expecting that the time would come when they could operate at a profit. If, at that time, the station operators, members of the Commission, or other people in high places, had publicly complained about the financial losses they were incurring or that the allocation structure might be changed, unquestionably the acquisition of television receivers by the public would have slowed down considerably or might have come to a complete halt.

ADDITIONAL VHF CHANNELS WILL NOT SOLVE THE PROBLEM

If additional VHF channels were to be added from the military or that portion of the band now allocated to FM, as has been suggested, those stations would be faced with the same conversion problem with which UHF stations have been faced. Nor would the number of VHF channels possibly available from these sources meet the requirements for additional television channels. UHF channels would still be required to meet the needs of the country.

DROP-INS, DIRECTIONAL ANTENNAS, REDUCTIONS IN MILEAGE SEPARATIONS, REDUCTIONS IN POWER, REDUCTIONS IN ANTENNA HEIGHTS, ETC., ARE NO SOLUTION

All of these suggestions, while offering possibilities of some additional stations, are purely devices which would result in inefficient use of spectrum space and in most instances will probably deprive many more people of service than would be provided a service with the full development of the present allocation plan.

Here, again, we have an analogous situation in the development of AM broadcasting. From time to time since the creation of the Federal Radio Commission in 1927, the engineering standards have been lowered because of pressures for additional stations. The result, as of today, is that all classes of standard broadcast stations are receiving much more interference than was originally contemplated.

With television having made substantial strides in the few short years of its existence, and with the benefit of the hindsight we have in AM broadcasting, we should not take steps which would result in increased interference to the existing television service. This is particularly true in that the development of UHF channels will provide channel space for the additional stations required as economic conditions permit. The additional VHF stations added through any of the methods we are discussing will adversely affect the development of the UHF because it further reduces the incentives of all concerned, including the broadcaster, the public, and receiver manufacturers.

CONCLUSIONS

For the reasons already covered, I believe that this committee should agree with the following:

1. An allocation plan is needed and the present allocation plan of the Commission, except for possibly some minor shifts such as have already been made since its adoption, is satisfactory and should not be substantially modified.
2. This committee and the Commission should announce publicly, with as much dispatch as possible, that their studies and deliberations show that the UHF channels are capable of rendering satisfactory television service and that no change in the general allocation structure is contemplated; and
3. This committee and the Commission should do everything possible to encourage manufacturers to produce all-channel receiving sets.

Senator PASTORE. I have not read your statement, Mr. DeWitt. I don't know what you have said. If you want to make some summary of what you have told us, then I could ask you questions. But I have no prepared questions to ask you, unless you tell me what you have said.

Mr. DEWITT. I wouldn't expect you to, Senator. This is not a long statement, and I think I can summarize it fairly quickly.

Senator PASTORE. Yes. You just take the salient items and point them out to us.

Mr. DEWITT. All right, sir. I feel that I am qualified as an engineer as well as in the management field——

Senator PASTORE. Let me ask you one question before you go any further. Has your situation anything to do with the situation of the previous witness?

Mr. DEWITT. No, sir.

Senator PASTORE. All right.

Mr. DEWITT. I am an operator of a VHF channel 4 station in Nashville, Tenn., which was the pioneer station in Nashville.

Senator PASTORE. All right, sir.

Mr. DEWITT. I am just expressing some views here really on allocation matters.

Senator PASTORE. Yes.

Mr. DEWITT. More than anything else.

Senator PASTORE. All right.

STATEMENT OF JOHN H. DeWITT, JR., PRESIDENT OF WSM, INC.

Mr. DEWITT. I feel that I want to make it clear that the development of UHF is essential to full development of our television potential. Some seem to think of UHF as an entirely separate part of the spectrum. Actually it is an extension of a band which we now call VHF but which ultimately could be developed into one television service which would be channel 2 through channel 83. You would think of it as just one broad television service.

UHF has been pictured as an inferior method of bringing television to the people. I feel, on the contrary, that it is an undeveloped or not fully developed method of doing so. As we go up in the spectrum, we do not suddenly come to a point where everything becomes bad. Physics is not like that. As we go up in the spectrum, the frequencies are affected more adversely by hills, so that you do not have as wide coverage for the same power on UHF as you do on VHF. But on the other hand, there are some advantages that UHF has over VHF, which I point out here. One is that there is less manmade noise on the UHF band. There is less cosmic noise, and cosmic noise does limit VHF reception at times. There are fewer ghosts on UHF. It is possible to get a cleaner, prettier picture on UHF under many circumstances than it is on VHF. So, there are some advantages. Another advantage is that now that we have high-power tubes developed—I believe the military sponsored the development—these are mainly klystron tubes—it is possible to generate high powers in the UHF, which we need to develop this service.

We have a fairly close parallel here between the VHF–UHF situation and the broadcasting situation in the standard band. There are great disparities in the propagation characteristics of broadcast frequencies. 1,500 kilocycles in New England is certainly far inferior to 600 kilocycles—or I have an example here. In North Dakota there is a 5-kilowatt station on a low frequency which has much greater daytime coverage than higher frequency stations with 50 kilowatts in other parts of the country. So there are disparities which the broadcast business has had to live with, and does live with.

Now, I notice in reading the statements that have been put in that no one has said that if UHF is fully developed there won't be enough channels for everybody. Now, that is a very comforting thought, and it makes you think that you should strive even more to make UHF go.

The situation here is not too different from the VHF situation 5 to 8 years ago. My station invested $200,000 in a microwave system just to bring network service from Louisville to Nashville, and it took us a long time to get that money back. We are now in the black, but we spent an awful lot of money on VHF broadcasting before we got it back. And I remember in one board meeting I predicted that in the first year of operation we would have 500 sets in the Nashville area.

This was in 1948 and 1949 when we were talking about it—that we would build up 500 sets. Of course, that was all wrong, because no one anticipated how television would go.

The crux of this whole matter, in my opinion, is to find a means of getting all-wave or all-channel receivers in the hands of the public. That is really the meat of the matter. I think that some incentive has to be provided.

One possibility is this: We have made some experiments with satellite stations. It is all in the record of the FCC. Presumably you could create a market by allowing VHF operators to put in translator stations on the fringe of their coverage area. Let's say a kilowatt radiated power on UHF—it would have to be UHF. These would translate the signal of the VHF station. Then people in those markets and in those small towns would want to buy all-wave receivers. This would give you a market which the receiver manufacturers might be interested in.

Now, there is a very close parallel here between this proposal and the broadcast business—radio. Years ago it was not possible for small towns to support radio stations. The clear channel signals were out there. Our station, for example, in middle Tennessee—WSM Radio—put a signal into these towns and caused people to want to buy radio sets. And they bought them and build up a market in these towns. So then the local operator could come in and put in his own radio station and capture part of this audience. He could not possibly have afforded to do it if the sets had not been there. He could not have put in this little 250 watt or 1,000 watt station in the town. Now, the same could be true here, I think. You could provide a signal in UHF which would cause people to buy receivers, and then later on the UHF operator could come in and you might have what some people call home-town television.

Now, I feel on the allocation plan some people have proposed to handle this thing on a case-by-case basis. I do not think you can do that. I think you need an allocation plan, and it seems to me that the sixth report and order of the Commission is a pretty good one. Maybe there should be some minor changes, but it is a pretty good plan. Any plan that you make has to be based on some assumptions as to what you want to accomplish, but also it has to be based on very solid technical information on the propagation of radio waves. And this plan is based I think on very sound information which the Commission had.

I think what we need with UHF more than anything else is an affirmative expression of confidence in its future development. If at the time the VHF operators went on the air, members of the Commission or other people in high places had publicly complained about the financial losses, or if the station operators had done that, or if the Commission had indicated the allocation structure might have been changed, unquestionably the acquisition of TV receivers by the public would have slowed down completely or might have come to a complete halt.

Now, I do not believe that the addition of a few VHF channels will solve this problem. I have made no careful study to see where they might come from, but people who have, tell me that there is very little chance of getting more than a few VHF channels from FM or from the military. This won't solve the problem. Actually, in my opinion, it would slow down the overall development of television, because to have this fully developed service you have got to have the UHF band. And if you throw in a few channels, you will stop the cries momentarily, but you will slow down UHF development.

Now, the same is true of "drop-ins" and the use of directional antennas, reduction of mileage separations, reduction of power, and so on. I would not propose to discuss these individually, but they certainly will not solve this problem. In conclusion, I would like to make three points. One, an allocation plan is needed, and the present allocation plan of the Commission, except for possibly some minor shifts such as have already been made since its adoption, is satisfactory and should not be substantially modified. Two, this committee and the Commission should announce publicly, with as much dispatch as possible, that their studies and deliberations show that the UHF channels are capable of rendering satisfactory TV service and that no change in the general allocation structure is contemplated. And, three, the committee and the Commission should do everything possible to encourage manufacturers to produce all-channel receiving sets.

That is all I have.

Senator PASTORE. I will have to call a recess for half an hour. We will meet again approximately at 3: 30.

(Whereupon, at 2:50 p. m., the hearing was recessed until 3:20 p. m.)

Senator PASTORE. When Mr. DeWitt concludes his testimony, our next witness will be Mr. Paul W. Morency of Hartford. Senator Purtell desires to be here when Mr. Morency testifies. So if we conclude with this witness before Senator Purtell returns, we will wait for him, if that is satisfactory to Mr. Morency.

Mr. COX. Mr. DeWitt, as I understand it, you said that the sixth report and order is substantially valid because it is based on very careful information and on the best propagation data available. In your opinion, is that propagation information reliable as a basis for predicting the actual service area that can be achieved by television stations?

Mr. DEWITT. I think it is. I think it is the best. Now, this is a very complicated, technical problem, to predict exactly the service area of any given station. The methods sought in the sixth report and order allow you to depict the average situation. Of course, the information is being improved all the time—propagation information is being improved. I do not believe that the Commission has reached the point where they would modify their present method appreciably, so I think they would let it stand.

Mr. COX. Do you have what you think is accurate information as to the coverage area of WSM-TV?

Mr. DEWITT. Yes, sir.

Mr. COX. Is it larger or smaller than that which would be predicted based on the Commission's——

Mr. DEWITT. I believe it is pretty close to what would be predicted, very close to it.

Mr. COX. What is the terrain around Nashville? Do you have mountainous terrain there which would limit your signal more than would be the case on level terrain?

Mr. DEWITT. A little more. But it is rolling. It is rolling terrain, about like Virginia over here before you reach the mountains.

Mr. Cox. So that actually you feel that the circumference of your service area is substantially as would be predicted by the Commission staff?

Mr. DeWitt. I think so; yes, sir.

Mr. Cox. Now, in your opinion, could a UHF station come on the air in Nashville and compete with the three established V's there?

Mr. DeWitt. I don't think so; no, sir.

Mr. Cox. Could a fourth V come on the air and compete now or in the reasonably forseeable future?

Mr. DeWitt. I would say that it could not in the reasonably foreseeable future.

Mr. Cox. That is, you think that Nashville now has the maximum television service that it can support?

Mr. DeWitt. At the present time. Now, sometime way off perhaps it can support more.

Mr. Cox. Are all three of the V stations in Nashville operating at a profit, to the best of your knowledge?

Mr. DeWitt. Are they what, sir?

Mr. Cox. Are they operating at a profit?

Mr. DeWitt. At a profit?

Mr. Cox. Yes.

Mr. DeWitt. I believe they all three are. I know that two are. I believe that the third one has turned the corner. That is hearsay, of course, but I believe it has turned the corner. It was operating at a loss for some time.

Mr. Cox. I realize this question is hypothetical, but suppose that 1 of these 3 V allocations in Nashville were a U, do you think that a station operating on that channel could survive in Nashville, even though it has been demonstrated that Nashville apparently will support 3 V stations?

Mr. DeWitt. I think that now that Nashville is established as a V market and the receivers in our coverage area—the 200,000 receivers or more on our coverage area—they are buying V receivers, not all-channel receivers—and I believe if one of these stations would change to a U that it would have a very, very hard time.

Mr. Cox. Well, suppose then that originally there had been a U allocated there, and that the V stations were on the air first. Would you have thought that a U could then come into existence? The point I am getting to is this: If you have V stations established in an area, certainly if there are more than one of them, even if there are additional U allocations available, so that on the allocations table there is room for growth, isn't it true that the established position of the V's makes it competitively impossible for any other station to come into the area?

Mr. DeWitt. I don't think so. I think my answer has to be highly qualified. But I would say this: Suppose 6 months after we went on the air on channel 4 a U had come on. At that time I believe we had perhaps 25,000 to 50,000 sets in the area. If when the U came on at that time, all-channel receivers were available generally, and if the U had a good program service—we are on NBC now, let's say the U came on with CBS—then he would, I think, ultimately come out all right.

Mr. Cox. By "good program service" do you mean necessarily network service?

Mr. DeWitt. I am afraid so; yes, sir.

Mr. Cox. Is there a tendency on the part of the networks and the national advertisers to prefer a V station if there is one in the area?

Mr. DeWitt. I don't really know that, because we don't have any U's in Nashville. And I am familiar with our own market and not with other markets necessarily.

Mr. Cox. I think you said it cost no more for equal power to operate a U station.

Mr. DeWitt. That is right.

Mr. Cox. Are you speaking there of construction costs or operating cost?

Mr. DeWitt. I am speaking of both.

Mr. Cox. Both?

Mr. DeWitt. Yes. I am speaking of a U versus a high-band V.

Mr. Cox. Now, that is the high-band V operating at 316,000 watts?

Mr. DeWitt. That is right.

Mr. Cox. And the U operating at what, a million watts?

Mr. DeWitt. A million watts; yes.

Mr. Cox. I think you said that it doesn't appear prudent for U operators to make additional investments at the present time. Is that the way you put it? You made the point that UHF operators must be willing to spend substantial sums in initial installations in order to provide the coverage necessary to attract advertisers, and pointed to the fact that your station lost money initially, and eventually was able to turn the corner. Now do you think that, viewed realistically, the present climate is such as to encourage anyone either to make an initial investment in UHF television stations or to spend substantial money in improving an existing station unless they are given some assurance that some relief to their present situation is going to be forthcoming?

Mr. DeWitt. I think, of course, it depends entirely on the individual market that we are talking about. I think a lot of U operators went into places in which they could never come out. And I think that if a VHF goes in under the circumstances under which some of the U's went in that they would have had trouble too. It is a very complicated problem. I think, though, that under certain circumstances—well, let's take the Knoxville situation that we were talking about here a few minutes ago. I believe two V's are allocated to Knoxville.

Mr. Cox. That is right.

Mr. DeWitt. If one V were allocated to Knoxville, if I were running the U, I would go ahead and pour the power on. And I would up my rate—if I had 89 percent conversion I would up my rate, and I would say I have got the finest picture in Knoxville, and I would try to put it over. And I think I could.

Mr. Cox. Would you make that expenditure if there were two V's?

Mr. DeWitt. I am not sure that I would in Knoxville. And I am not sure that I would in Knoxville if there were a third V. In other words, I believe that three V's in Nashville have a marginal situation—the third one does. And I believe that in Knoxville the third V would have a marginal situation.

Mr. Cox. Isn't there a substantial difference between the situation that faced the V's when they went on the air and were losing money and the situation that now faces the U operator is in that, at the very least, the V operator in the initial loss period had the assurance that he had a facility that suffered no competitive disadvantage with his competitor, and that that is not true of the U operator?

Mr. DeWitt. Well, there is something to that.

Mr. Cox. That is all I have.

Senator Pastore. I am not suggesting that you should, but you are in a three V area. You wouldn't want to trade your V for a U, would you?

Mr. DeWitt. No, sir; I certainly would not.

Senator Pastore. All right.

That is all. Thank you.

STATEMENT OF PAUL W. MORENCY, TRAVELERS BROADCASTING SERVICE CORP., HARTFORD, CONN.

Mr. Morency. Mr. Chairman and members of the committee, my name is Paul W. Morency. I am president and general manager of WTIC in Hartford, Conn.

Our company has been operating a radio station for some 30 years. In 1947 we applied for a television station. We thought then, and we think now, that the experience that we gained in broadcasting to the people of New England over that long period of years qualified us to know what the New England people want and need in the way of broadcast service, and we think that we can do a good job in television.

I appreciate the opportunity of presenting our views to this committee and I have a written statement which I would like to have incorporated into the record. If it pleases you, I would like to just digest some of the points for the committee.

Senator Pastore. If there is no objection, the statement will be printed in its entirety.

(The prepared statement of Mr. Paul W. Morency follows:)

My name is Paul W. Morency. I am president and general manager of the Travelers Broadcasting Service Corp., which has been for more than 30 years the owner and operator of station WTIC at Hartford, Conn. I have been in radio broadcasting since 1925, and I have been general manager of WTIC since 1930. I think my experience in radio broadcasting in New England, and the studies and observations which I have made of television, qualify me to comment on the television situation in Connecticut and the Connecticut River Valley.

I appreciate this opportunity to present my views on Connecticut's urgent need for additional television service and on the prospects for future television development in this area.

I would like to summarize briefly the efforts of our company to obtain an authorization from the Federal Communications Commission to build and operate a television station in Hartford, because I think the long delay in bringing television to the people of the Hartford area from a local VHF station is pertinent at this time.

Our company commenced the operation of WTIC in Hartford in 1925, and we applied for a television station in Hartford on September 10, 1947. We believe that our experience and success in broadcasting to the people of Connecticut, and our understanding of their needs acquired over a long period of time, render us well qualified to do a good job in television. Our application was designated for hearing in 1947, due to competing applications for the same channel. At that time, there were two VHF channels allocated to the Hartford-New Britain area, channels 8 and 10. Before the hearing started the Commission was confronted with a petition to move channel 10, for which we had applied, to Bridgeport, Conn., and the Commission imposed its 3-year freeze on the industry in order to restudy its countrywide allocation plan.

We participated extensively in the Commission's long allocation proceeding. During the course of the rulemaking proceeding, channel 3 had been tentatively assigned to New London, but in the Sixth Report and Order of 1952, the Commission adopted our proposal for its assignment to Hartford. In allocating channel 3 to Hartford, the Commission noted that the population of Hartford was more than five times that of New London, and that Hartford, being the capital and central population area of the State, deserved the VHF assignment. The Commission also noted that the coastal area to the south and east of Hartford, including New London, would receive service from channel 3 in Hartford and would also receive additional VHF service from channels allocated to Providence and New Haven.

After the release of the Sixth Report and Order, and relying on that decision which had been so long in the making, we amended our pending application to specify channel 3 instead of channel 10. Subsequently, two other applications for the same channel were filed. One of the applicants, station WDRC at Hartford, dismissed its application after entering into a contract with our company to purchase an interest in our television station if our application were granted.

However, a hearing was still necessary because of the third applicant. This hearing, which began in October 1953, was not concluded until April 13, 1954. More than a year later, in May 1955, the examiner issued her initial decision in the case recommending a grant of the station to my company. Exceptions were taken to this initial decision, and oral argument was held before the full Commission 2 days ago. We are very hopeful that a final decision will be released within the near future authorizing us at last to go on the air with the television station for which we applied almost 9 years ago.

We are fully prepared to bring television on channel 3 to the Hartford area in from 60 to 90 days from the date of a favorable decision on our application. We have already made extensive preparations for building and equipping what will become one of the finest television plants in the country. For instance, we will have color equipment which will bring not only network but local color programs to the Hartford area. We have made extensive contacts with religious, educational, and civic groups and organizations in our territory which assure us of the participation of these organizations on a regular basis in our television programs.

The four UHF statons in the Connecticut River Valley which have petitioned the Commission to delete channel 3 from Hartford, WKNB-TV, New Britain; WWLP, Springfield; WHYN-TV, Springfield-Holyoke; WGTH-TV, Hartford, went on the air without competitive hearings, with the full knowledge that channel 3 was coming on later, and they have been very successful in solving the conversion problem. In addition, all sets sold in this area now and for the past several years are all-channel sets. A newletter that WKNB-TV issued 3 weeks ago used a headline: "The Biggest, Healthiest, 3-Year-Old You've Ever Seen." The release also stated: "When WKNB went on the air there were only 13,000 sets in its area which were equipped to receive its signal. In 3 years, the channel 30 family has grown to 375,000 homes. The American Research Bureau reported last month that 93 percent of the television sets in Hartford County are equipped for UHF, a conversion rate almost unmatched elsewhere in the country."

This conversion rate is the same for the four television stations in the area which have asked that channel 3 be deleted from the commercial service. There has been testimony both before the FCC and before this committee by the UHF operators that the big problem which they must surmount to be successful is the conversion of existing sets to receive UHF signals and the sale of all-wave sets in their territories. It can be seen from the above that both of these problems have been solved in the Connecticut River Valley. A recent release from WWLP, of Springfield, whose president, Mr. Roger L. Putnam, recently testified before this committee, states that this station had had an increase of 30 percent in its total billings in 1955 over 1954, including 50 percent increase in the number of national advertisers and a constantly growing list of blue-chip accounts.

At the present time, these four stations are broadcasting substantially the full schedules of either the Columbia Broadcasting System or the National Broadcasting Co., that is, WKNB-TV, New Britain, on channel 30, and WWLP, Springfield, on channel 22, carry substantially complete schedules of NBC, and WGTH-TV, Hartford, channel 18, and WHYN-TV, Springfield-Holyoke, channel 55, authorized to shift to channel 40, carry a substantially complete schedule from CBS. Parenthetically, the Commission has given favorable consideration to the requests of WWLP and WHYN-TV to improve their coverage in the area by changing their assignments to lower frequencies. WWLP was permitted to change from channel 60 to channel 22, and WHYN-TV has been authorized to operate on the lower channel 40 in lieu of channel 55.

WKNB-TV, channel 30, and WGTH-TV, channel 18, have entered into contracts for the sale of their stations to NBC and CBS, respectively, subject only to the approval of FCC. Even while filing briefs before the FCC predicting the ultimate failure of UHF broadcasting in the Hartford area if channel 3 were allowed to commence operations there, these 2 stations signed highly profitable sales agreements with the 2 networks. On February 23, 1956, the Commission approved the sale of WGTH-TV to CBS. The application for the sale of WKNB-TV to NBC is still pending before the Commission.

Let us examine what will result from the acquisition by CBS of WGTH-TV. Obviously, all CBS programs will be carried on this station and that of itself will guarantee the economic success of the station. This purchase also has an immediate and obvious effect upon UHF station WHYN-TV because it is necessary for CBS to have both stations on its network to give proper coverage to their advertisers in these populous and important markets.

If and when the approval of the FCC is given to the NBC-WKNB-TV purchase, the same reasoning will apply to WKNB-TV and to WWLP. Both of these stations will then carry full NBC schedules because both stations will be necessary to cover the Hartford and Springfield markets.

Mr. Putnam, of WWLP in his recent testimony before this committee stated that in his opinion WWLP—in fact, all of the UHF stations in the valley—could not long survive the advent of a channel 3 station at Hartford. In my opinion this statement is completely fallacious. Each of the networks will schedule their programs over UHF stations in the Hartford-New Britain and Springfield-Holyoke markets. There is no other way that coverage in these markets could be obtained.

We have a similar situation right here in Washington, D. C., and Baltimore, Md. Washington and Baltimore are roughly the same distance apart as are Hartford and Springfield, yet all networks carry full program schedules on stations in both Washington and Baltimore; they will do the same in Hartford and Springfield, as indeed they are now doing.

Dr. Frank Stanton, president of CBS, has testified that if WGTH-TV on channel 18 in Hartford were transferred to his company, it would not be necessary or desirable to delete channel 3 from Hartford. This transfer has now been approved by the Commission, and the new owner of the station, that is CBS, does not want, much less request, that channel 3 be taken out of Hartford.

Financial data filed with the Commission by WKNB-TV shows that as long ago as October 1954 the station operated at a net profit of over $20,000 for that month. WKNB-TV sold its station to NBC for $1,100,000, plus a lucrative long-term lease on the studio building owned by WKNB-TV, plus the retention with the station for a number of years of certain management officials.

The sales price of WGTH-TV, which had less equipment and a smaller investment, was $650,000. In both instances the sales price was approximately double the value of the assets of the stations. It would seem that these UHF operators valued their properties quite highly even with the imminent operation in the area of a station on channel 3.

In fact, WKNB-TV in a prospectus dated December 22, 1954, relating to the public offering of its stock, stated as follows:

"The current affiliation agreement with CBS is for a 2-year period, beginning January 28, 1953, and will automatically be renewed for an additional 2-year period, beginning January 28, 1955. The terms of the contract include a provision that neither party can cancel except on 1 year's notice. The affiliation with CBS provides WKNB-TV with many excellent programs. Revenue from network programs accounts for approximately 15 percent of the net billings, compared to 25 percent from national spot advertising and 60 percent from local advertisers. The management believes that in the event the affiliation were discontinued, the company could continue to operate at a profit by using local programs, film and such network programs as were available."

None of the 4 UHF stations of which I have spoken is operated at anywhere near the maximum power—1 million watts—permitted by the Commission. The actual operating powers are:

	Power (kilowatts)	Percent of maximum power
WGTH-TV	187	19
WKNB-TV	210	21
WWLP	206	21
WHYN-TV	182	18

Testimony before this committee shows that equipment is now available to obtain the maximum of 1 million watts at less than the cost incurred by a VHF channel in obtaining 316,000 watts.

It seems to me that these UHF stations, by failing to utilize their maximum facilities and by proclaiming the inadequacy of their existing service, have gone far toward convincing advertisers and advertising agencies that their stations should not be used.

A number of proposals have been presented to the Commission, starting as far back as October 1954, to delete channel 3 from its present assignment in Hartford and substitute instead a UHF channel. The first of these proposals, filed more than a year and a half ago by the four UHF stations which I have just discussed, would have changed the status of channel 3 so that it could be used only for noncommercial educational purposes.

In effect, this would have removed the channel from any use at all in the foreseeable future, since the educational interests of the State have no plans to build and operate a television station. When this became apparent, the UHF petitioners amended the proposal so as to adopt a request made by another party to remove channel 3 from Connecticut entirely and reassign it to the small town of Westerly, R. I., from which place it would be used, in effect, as a third Providence VHF outlet. In addition to the request to delete channel 3 from commercial service altogether and the request to remove it to Westerly, there have been proposals to reassign it to Norwich or New London, Conn.

All of these proposals lack justification from the public-interest standpoint. Hartford has a population of 177,000, and the population of Hartford County is 540,000.

The State of Connecticut had in 1950 a populatio nof 2 million and in 1955, was 2,250,000. Not only is Hartford the capital of Connecticut, but it also is the social and economic center of the very heavily populated and important industrial and agricultural region.

The terrain in a large portion of our area is rough and hilly and as a result contains many sections where penetration by UHF service is very spotty, due to shadowing. Therefore, the assignment of channel 3 to our area is essential in order to provide all of the people living in our service area an adequate television service.

The reassignment of channel 3 to Westerly, Norwich, or New London would result in 50 percent or more of the signal being wasted over water, thus resulting in a much less efficient use of the channel than at Hartford. Connecticut was allocated only two VHF frequencies. One of these is in New Haven on Long Island Sound, the other being channel 3 in Hartford. We believe that it would be grossly unfair and inequitable to deprice the people of Connecticut of local television service from channel 3 in order to give this frequency to the smaller State of Rhode Island with a 1950 population of approximately 800,000 (1955, 853,000), a State which is already served by two VHF signals from Providence and by additional stations from Boston.

The primary reason advanced for the removal of channel 3 to Westerly, New London, or Norwich is to deintermix the Connecticut River Valley, but it is clear that such deintermixture would in no sense result. Although television set conversion in and around the Connecticut Valley is an accomplished fact and receiver set sales are 100 percent all-wave, there are still a substantial number of viewers in the northwestern and northeastern sections of Connecticut who have VHF sets only for the simple reason that no good UHF signal is available to them. Channel 3 would bring to the people in these areas either their first good television service, or would bring them their second usable signal.

If it is deemed desirable to allocate another VHF channel to Providence, there is no need to deprive Hartford and the State of Connecticut of channel 3. Our consulting engineer has advised me that channel 6 can be allocated to Newport, R. I., with but the need for a very minor relaxation of the Commission's rules insofar as minimum mileage separations are concerned. Channel 6 can operate at Newport with maximum power and antenna height and deliver an excellent (city grade) signal over Providence, fully competitive with the two existing VHF stations in Providence.

In conclusion, it is conceded that the UHF stations in the Connecticut River Valley have no conversion problem. The area is almost 100 percent converted to UHF and every receiver now being sold is an all-wave set. It has been said before this committee that if the conversion matter were solved there would be no problem of deintermixture for the UHF stations because listeners would be attracted to stations having the best program schedules. There is thus no reason to deintermix the area. The terrain is hilly, rough, or mountainous through much of the area that will be covered by channel 3, with resulting shadow areas inevitable for UHF signals. The UHF stations in Hartford and Springfield-Holyoke are all operating at a profit and would continue to do so even with the advent of competition from channel 3. The Hartford and New Britain stations have been sold at a good profit to NBC and CBS, and these companies are extremely well qualified by experience, know-how, and adequate financial resources to assure the successful operation of the stations. The Springfield and Holyoke television stations will not lose their network affiliations. Although the UHF stations in the area are operating with only a small fraction of the 1 million watts allowed, they can procure equipment necessary to bring the power of their stations to 1 million watts by an expenditure of a sum no larger than would be required for a VHF operator to build a station with maximum power. The moving of channel 3 to New London, Norwich, or Westerly would not deintermix the area and would waste substantially half the signal over water.

In view of all of the above, I most strongly urge the retention of channel 3 in Hartford.

Senator PASTORE. We appreciate that concession on your part.

Mr. MORENCY. Thank you.

As I say, we applied in 1947, in September to be exact, and we were required to prepare for a hearing because there were other applications for the frequency. At that time channels 8 and 10 were assigned to Hartford. We prepared for that hearing.

Just as it was to commence—it had been assigned a date early in January 1948—an application was made by one of the applicants to remove the channel from Hartford to Bridgeport, Conn.

The Commission considered this application and found that it was necessary to substitute rulemaking, and that led to one consideration, and one delay of our hearing after another, until we ran into the freeze which was imposed on the whole industry by the Commission, in order that they study the nationwide allocation plan.

So, actually, it seems that this is a second time around for us. After the sixth report and order, when channel 3 and other channels were assigned to Hartford, we made that application, and we also had other applicants for the channel.

Senator PURTELL. May I interrupt. That was back in 1952 when channel 3 was——

Mr. MORENCY. Yes, sir. The sixth report and order was issued in April, I believe, of 1952, and therefore that was already 5 years after we had applied for television in Hartford.

So there were two other applications for the channel. One of them joined with us and withdrew their application and executed a contract whereby they would become part owner of our organization in case our application was a successful one.

Now, our hearing actually didn't begin until October of 1953 and wasn't concluded until the following April of 1954. It was a lengthy hearing, an arduous one; and the examiner took a year, or a year and a month, to render a decision which was favorable to my company.

Exceptions were taken to this initial decision, and the oral argument on this case was held just Monday of this week before the Commission. Now we are hopeful that a final decision will be released in the near future which will authorize us to go ahead and get on the air with a television station which we applied for almost 9 years ago. It will be 9 years in September.

Senator PASTORE. What is the status of your application now? Have you been granted by the Commission, the——

Mr. MORENCY. No, Senator; they just heard the argument 2 days ago. So normally I would think it would take them from 90 to 120 days to render a decision on it. At that point, if it is favorable to us, we would be at the point where we could build.

Senator PASTORE. How many petitioners or applicants are there for that channel?

Mr. MORENCY. Two. There were three. One joined with us; so the hearing was held just with two parties.

Senator PASTORE. All right.

Mr. MORENCY. Now, we are prepared to get on the air with our TV station, if we are granted it, in from 60 to 90 days. It just happens that our transmitter location will be the same as our AM transmitter so we have a building facility. Other things are so that we can get on the air quickly.

We have made preparations in that area. We are going to have color equipment both for local and network programing. We have made extensive contacts with religious, educational, and civic groups and organizations, so we know they will participate on a regular basis in our program schedule on television.

Now, the 4 UHF stations in the Connecticut River Valley—that is 1 in the New Britain, channel 32; 1 in Hartford, channel 18, and 1 in Springfield, and 1 in Springfield-Holyoke, petitioned the Commission some time ago to delete channel 3 as a commercial television facility in Hartford and change it over to the educational category.

Well, after it became apparent that the educators in the State were not going to build, they reversed their field a bit and adopted a proposal from Westerly, R. I., that would remove the channel from Hartford and Connecticut entirely and put it in Rhode Island.

Then after that we also had two other applications for its removal from Hartford, one from Norwich, Conn., and one from New London. The hearings, of course, as the committee members know, were held on those petitions; they were denied.

Well, now, I would like to examine just a little bit the position of the UHF stations in the Connecticut River Valley.

They had no contest on their channel, so they were able to get on the air early. Let me see: In Connecticut, New Britain got on the air, I think in February of 1953; and in Springfield, one got on the air in March, and I think one in April of 1953. The last 1 of these 4 got on the air, I believe, early in 1954. That was channel 18, in Hartford.

Now, they had, as I say, no contest. They got on the air early.

There was a great need for television service up there and they have done a fine job in the conversion factor.

In fact, I think they all agree, and it has been so testified before this committee, that the conversion factor in this area for these 4 stations is about 93 percent. But even more important than the 93 percent is the fact that all of the sets sold in this area for the past several years, and continuing now, are of the all-wave variety.

There is no problem here of circulation, in other words. We have a densely populated, prosperous area of New England and they are all able to—practically all in this area—able to receive the UHF channels.

I would like to quote, for instance, from a little newsletter that WKNB-TV issued 3 weeks ago. The headline on their news release was: "The Biggest, Healthiest, Three-Year Old You Have Even Seen." They also stated: "When WKNB went on the air, there were only 13,000 sets in its area which were equipped to receive its signals. In 3 years, the channel-30 family has grown to 375,000 homes."

Apparently they completely—I think Mr. DeWitt just testified that in the area of WSM-TV, there are only 200,000 VHF sets in his whole territory. It gives you an idea of what condition exists in this Connecticut River Valley where one UHF station has a circulation double the station of Mr. DeWitt's in Nashville.

To continue the quote:

The American Research Bureau reported last month that 93 percent of the television sets in Hartford County are equipped for UHF—a conversion rate almost unmatched elsewhere in the country.

Well, that is the conversion problem which most people have conceded in the particular problem of UHF.

If they have circulation they have the prime requisite for a successful television station. Only one other ingredient, to my mind, is necessary, and that is good programing. So, if we concede that they have the circulation, and if we concede that that is the prime requisite and only a second factor is necessary, then let us examine just what they have in the way of programs in this area.

Well, at the present time WKNB-TV in New Britain, on channel 30, and WWLP, Springfield, on channel 22, carry substanially all the schedules of the National Broadcasting Co. The other two stations, channel 18, WGTH-TV in Hartford, and WHYN-TV, Springfield-Holyoke, channel 55, carry substantially complete schedules of CBS. In addition, I believe, WWLP carries some programs of the American Broadcasting Co.

I would just like to insert here that these Springfield stations—Springfield-Holyoke—had higher frequencies in the UHF band. They had 60 and 55, I believe. They petitioned the Commission, and the Commission granted them the right to go to lower frequencies. So now one is on channel 22 and one has been granted the right to go to channel 40, though it hasn't made the move yet.

So they have the full schedules of the two top networks. They have full conversion. They have a hundred percent sale of all-channel sets.

Senator PASTORE. And what network will you be affiliated with, or don't you know?

Mr. MORENCY. We don't know for this reason, Senator; we won't be able to get CBS or NBC, because they are tied up with these four UHF stations.

Senator PASTORE. Well, do they own them?

Mr. MORENCY. The CBS has just had approved, by the Federal Communications Commission, the purchase of channel 18, WGTH in Hartford. That is an accomplished fact. The other one, WKNB-TV, has been purchased by NBC. That contract is before the Commission for approval. It lacks only the FCC approval to become a fact.

Senator PASTORE. Is that a Hartford station, too?

Mr. MORENCY. Well, it is called New Britain. But, it is built to serve New Britain and Hartford and the same area in a channel 18 service, that it right.

In the original allocation, the Commission called New Britain-Hartford one market. In the sixth report and order, they are now called two markets, and New Britain is assigned a UHF station and Hartford is assigned a different one.

Senator PASTORE. Therefore, it cannot be argued, in your particular case, that if you get the permit to operate your TV station, that you will prejudice, in any way, contracts that CBS and NBC have with the UHF stations.

Mr. MORENCY. I can't see how we could, Senator, because I doubt whether they would make a contract with us when they own stations in the area.

Senator PASTORE. Well, that is an unusual situation.

Mr. MORENCY. Actually I think the Hartford situation is unique in the country, perhaps, because of that situation—that and the conversion and sale of sets factor. So, now, we have the 2 top-rated networks—ABC is coming on fast, but certainly doesn't compete now in program quality with the other 2—and they are giving their full schedules to these 4 stations. There has been a sale approval of one to CBS.

Now, I would like to comment that even if the Commission did not approve—and I have no information on it—even if they didn't approve the sale of the New Britain station to NBC, it would not affect the UHF problem of circulation here, because CBS will have to use their station in Hartford and also the station in Holyoke-Springfield to cover those two markets.

There is an analogous situation here, right here in Washington and Baltimore. Here we have 2 cities about 30 miles apart or so, and each network carries the full program in Washington and also on a station in Baltimore.

The same thing would be true up there.

Now, no one in this area would buy a set which was incapable of receiving the CBS programs; because it would be like buying a set that would be capable of receiving only half of the top programs of the country. So we can say that they will be—we can say that there will be guaranteed sale of all-wave sets in this territory from now on. That has also been true for the past several years.

Now, I just want to comment on the fact that Mr. Putnam of WWLP—he was a recent witness before this committee, and he stated among other things, that he didn't think that his station, nor in fact, any of these UHF stations, could long survive the advent of channel 3 on the air in Hartford.

Now, I must admit in the light of the conditions and the facts as they are, and the ownership of one of these stations by a network, that that statement just does not hold water. It just isn't so.

In fact, let's see what Mr. Putnam, also through his publicity department, released about 10 days or 2 weeks ago—a statement to the effect—it is here in my statement—that for 1955, over 1954, his total billings were 30 percent better, and his national accounts were 50 percent greater in number; and that he had an increasing number—if I am quoting him correctly—of "blue chip" accounts. I don't think the statement he made before this committee, upon examination, could stand up.

Now, a further point: Since the transfer of this—actually I don't think the transfer of this channel 18 to CBS has physically been made, but the approval is out—and Dr. Frank Stanton, before the Commission, stated that if that transfer were made to his company, he would not want, or expect or find desirable, the deletion of channel 3 from Hartford.

Just one comment on what appears on page 7 of my statement: That these stations were sold for substantial sums; in fact, about twice the value of their assets. They were held quite highly by their owners and I would like also to refer specifically there to the quote from a prospectus relating to the public offering of stock by WKNB-TV that appears on the top of page 8. This refers specifically to the conceivable loss of network program service.

On the bottom, where we have supplied emphasis, you will note this one sentence. It says:

> Management believes that in the event of affiliation contract is discontinued—

in this case he is talking about a CBS affiliation—it is now an NBC affiliation—same effect—

> the company could continue to operate at a profit by using local programs, film, and such network programs as were available.

There is undoubtedly—and I believe that is a true statement—I believe it is factual—he is now speaking of the fact that you can program a station in his opinion, that is, in the WKNB management's opinion, without network service and still have a good service and a profitable, economically sound service. I believe he is right. It is being demonstrated in cities where there are allocations of 6 and 7 frequencies. They have to be good markets, I grant, but this is a good one.

Now, all of these things that we have been saying about UHF, the conversions, the sale of all-wave sets, the economic soundness of their present operation—have accomplished all this without even going to the power which has been allowed them under their license.

The table on page 8 shows just what that power is that they have been operating with.

Senator PASTORE. Mr. Morency, could I ask you a question. I have been curious about this: What would be the disadvantage to you, in the public interest, in service to your community, if the station which you are applying for, a V, were a U instead, which would be consonant with all of the activities within that valley? I mean, that is what I am curious about. I wish you could answer that question, if you can.

Mr. MORENCY. I will be glad to answer it.

Senator PASTORE. You see, the objections made by those who operate UHF stations within that area take the position that somehow you are going to have an advantage over them—you will have more power or your range will be greater; whereas, if you were given a UHF station, you would have no more than they have, and people are already equipped with sets to receive your signal, and that for that reason it would be in the public interest. Then that VHF channel, the chances are, could go in service in another area where it would be all of one type.

Now, I realize I have said here several times that channel 3 ought to go to Providence. Senator Purtell has perhaps resented that. I don't say even Westerly. Let it go to Poquonock—that is still in Connecticut, right across the river. But the thing that we have been troubled about is this. If you could have all 1 type of frequencies in 1 area and serve everyone with 3 channels, and have all of the other type in Hartford and still have 3 channels, what would be the hardship in that particular case?

If you can't answer it, or if you feel you don't want to——

Mr. MORENCY. I would be delighted to. I think I can.

Senator PASTORE. All right.

Mr. MORENCY. First, you said that they say that there is a difference in power. Well, there is no difference in power, Senator. The Commission, and the engineers of the Commission, and the industry, decided the differences in power. On the low VHF channels, you are allowed 100,000 watts. On the higher VHF channels, you are allowed 316,000 watts. On the UHF channels you are allowed 1,000,000 watts. Those changes in powers, in what you call effective radiated power, are to compensate for the differences in propagation characteristics of the various frequencies. So there is no change and no difference in power.

Now, as to why we shouldn't have a UHF—and I don't think we should. Let's take the public interest, which is paramount here, first. This is quite a hilly and mountainous country northwest and northeast of Hartford. We get into the Berkshires on the northwest, as you know; and we have a great deal of real rough terrain.

Now, regardless of what the "slip-stick" says, or the extension of the service says, for UHF—and they will draw a circle out there—but in the interstices behind the hills and under certain conditions there is spotty coverage. I think all engineers who have studied the matter say so. They all agree on that.

Channel 3 on the other hand will give good service to those areas. Now, that is the principal thing. There are areas here in our State, Senator, where even now—where the UHF signal says it is there—but those are the few sets that are not converted, or the comparatively few, because actually there is no signal there that they can take advantage of.

I was about to say that even these UHF channels have not used their high power. They haven't used the power that they are allowed to use. They could improve the picture somewhat. They will not, however, be able to get behind the hills and into the valleys where UHF has a weakness—it is spotty.

Now, I think that the public in Connecticut and western Massachusetts, in this very rough terrain—and we have rough terrain even in between, even in eastern Connecticut, and in northern Connecticut—they have a right to a good signal, or 2 good signals, before other people get 3 or 4 signals.

I agree with you, because I heard you say it, that New York City should not have 7 channels—never should have had 7 channels. I think the citizens of Rhode Island and Connecticut are just as first-class as those in New York City, and they should have the same availability of service. I think the citizens of Connecticut should have this channel 3 service, because it will do some things that these UHF channels will not do.

Now, I want to make another point. In bringing, now, television service to this area, which they do not now have, we have been through a long and arduous hearing. I have asked about this. Our legal counsel says that there is nothing about the hearing we just went through that would apply to a change—if you deleted channel 3 and put in a UHF. This hearing would go for naught, as far as we know. Everybody else could get in the act then. We could go through it again and come back here in 1959.

I think that the—I have been at this 9 years now, and I could stay at it another 9—but I think the people of Connecticut deserve to have this channel acted on, and have it stay here where it has been allocated after a long, really a long, study.

Did I answer your question, Senator?

Senator PASTORE. Yes; I think you have.

Mr. MORENCY. Thank you. I think I mentioned that there were proposals from Norwich and from New London as well as Westerly, R. I.

One of the prime justifications for all three proposals was that it was going to deintermix this area. Well, it won't. In the hearings before the Commission, the maps and everything submitted there show clearly, for instance, that from Norwich, channel 3 gives grade A service to the city of Hartford and most of Connecticut.

From New London, grade A service comes right on the door. From Westerly, grade B service, to Hartford and all of eastern Connecticut. You don't deintermix this valley by changing the location. All you do is take this channel out of Hartford, and out of Connecticut, and take away the ability of the Hartford people to program their own station.

I want to point out that with the transfer of one of our stations to CBS, and the possible transfer of the other to NBC—as well as those networks will run the stations; they won't run them like Connecticut people run them.

Senator PASTORE. Well, I don't go along exactly with that. I can understand your first argument that this clear signal would come to certain parts of Massachusetts and Connecticut which cannot be reached by UHF channels now existing. That is the first argument that you made.

Your argument, I think, in essence was that in the public interest, it would be bringing service to people who are not now enjoying it, and could not enjoy it even with the third U in Hartford.

But as far as the programing is concerned for the people in Hartford, why would that make any difference? The third U would give them a third program with a clear signal.

Mr. MORENCY. I used the wrong area there, Senator, because—well, I see your point.

Senator PASTORE. So far as Hartford is concerned, you would have an argument that there may be some areas that cannot now be reached by an existing U, or even a third U, in Hartford. I can understand the potency of that argument. But insofar as programing in Hartford itself is concerned, it would not, essentially, make any difference whether you had a third V or whether you had a third U.

Mr. MORENCY. Operated by Connecticut people.

Senator PASTORE. There would be a third channel available to people who have all-channels sets.

Mr. MORENCY. That is right. If it is operated by Connecticut people.

Senator PASTORE. Yes.

Mr. MORENCY. But to get Connecticut programing to Connecticut people, channel 3 should be operated as we are planning to operate it; or somebody from Connecticut, and not a network organization remotely controlled from New York City. That is my point.

Senator PASTORE. Oh, from New York City.

Mr. MORENCY. That is my point.

Senator PASTORE. Well, I go along with you, Mr. Morency. I think that that is where the basic trouble lies. You have too many channels in New York City, and if you could only move 2 or 3 out of New York City, you would improve the whole New England area by reallocation of those channels, which would give everyone more stations to enjoy, and more services to receive. But it is all concentrated down there. And the fact of the matter is that the lower part of Connecticut suffers because of it. That is, from a local point of view.

If a local merchant wants to advertise in sections of Connecticut adjoining the city of New York, he has to go to the New York station and pay the New York prices, in many instances for a patronage that is only local. And for that reason, of course, he is denied the services of television advertising, which is a serious problem.

Mr. MORENCY. That is right. One of the things on which I haven't made too much of a point here in my statement is this. We are trying to judge a brandnew industry at the end of actually only 3 or 4 years of expansion. We are trying to say that it has now set a mature pattern and we should judge all things on what now seems to be the fact. That never was true in radio. Radio took years and years and years, and is still changing.

For instance, just in the last few months, the dams have seemed to burst in the direction of program material available from Hollywood, due to consent decrees and willingness of the big companies to contract for the distribution of their product, and so on.

It is going to be much different in the next few years. The manufacturers are going to automation, in great degree, in the operation of television stations. It now takes a great many men to put on one simple program. It is going to be much different in the future years. I do not think it is going to be forever denied for Knoxville, for example, to be able to support 3 stations or 4 stations. That judgment is being made on what it costs to run a station now. I do not think that is going to be forever the truth. And yet this industry is only a very few years old. I think we are making judgments a little quickly.

Well, that about concludes my statement, with the conclusive statement on pages 11 and 12.

For the reasons that I guess I have outlined and digested, I think that our claim on channel 3 for service in Connecticut is a strong one, and it should be retained there. I would like to speak just a second, Senator Pastore, if I might, on the situation which you have in Rhode Island. We gave that some thought, too.

Senator PASTORE. Yes. I am very much interested. And I don't think there is any desire on the part of anyone to take anything away from Hartford. I mean I am merely arguing this on the question of intermixture. What I am anxious to get is a third station in our own locality, just as you are going to have a third station in Hartford.

Mr. MORENCY. Well, we don't have a third station.

Senator PASTORE. The only possibility of having a third station in Rhode Island is to have a third V, merely because you don't have the conversion and it won't be of any useful purpose to the people of the metropolitan Providence area unless you have a third V. Now, I am not saying it has to be 3; it could be 6, as you have suggested here. It could be anything. But apparently that has got to be ironed out, just as you have pointed out, because we are going in the direction now where large metropolitan areas should not be confined to two stations. They ought to have three channels and maybe more, if possible, so that you can bring the prices of advertising down to a competitive level. Otherwise, in time, it is only going to be for the big operators. And that is not fair.

Mr. MORENCY. I am not an engineer. What I know of engineering is what has rubbed off on me in the last 25 years or so. But I asked our consulting engineer, who is A. D. Ring and who was formerly the chief broadcast engineer for the Commission some years ago, and he gave me this memorandum, and also a map on the use of channel 6 in the Rhode Island area. We have had a few copies of that made, and I will be glad to furnish the committee with that statement.

Senator PASTORE. Yes. We would appreciate it.

(The document above referred to is as follows:)

A. D. RING & ASSOCIATES,
Washington, D. C., March 12, 1956.

Memorandum to Mr. Paul W. Morency.
Subject: Additional VHF television channel for Providence, R. I.

In accordance with you request, we have made a study of the various proposals and the possibility of assigning another VHF television station to render service to Providence, R. I., and the surrounding areas.

It was found that channel 6 may be assigned to Newport, with the transmitter at the point indicated on figure 1. Figure 1 is a map on which we have shown the transmitter site near Newport, the city boundaries of Providence, and the coverage contours; namely, city-grade service, grade A and grade B. This study discloses that the city service contour includes all of the city limits of Providence. The grade A contour includes substantially all of Rhode Island and a small portion of Massachusetts and Connecticut. There are several substantial towns in the portion of Massachusetts included. The grade B contour includes a substantial part of Connecticut, Massachusetts, and all of Rhode Island.

The location specified for the transmitter for operation on channel 6 with maximum power and antenna height (100 kilowatts, 1,000 feet) does not comply with all the mileage separations specified by the Commission. The attached table I shows the specified mileage separations, actual mileage and shortage.

In the case of adjacent channel 5, there are five applications pending for this channel at Boston. The transmitter site proposed by each is considered separately in the mileages.

A. D. Ring,
Registered Professional Engineer, District of Columbia Registration No. 790.

Table I.—*Separations on channel 6 at Newport Neck site*

[In miles]

Channel No.	Station or applicant	Specified separation	Actual separation	Shortage
6	WCSH-TV, Portland, Maine	170	167.5	2.5
6	WRGB, Schenectady, N. Y	170	159.5	10.5
5	Applications at Boston, Mass.:			
	Greater Boston Television Corp.[1]	60	59.0	1.0
	Allen B. Dumont Laboratories, Inc	60	61.5	None
	Massachusetts Bay Telecasters, Inc	60	61.0	None
	WHDH, Inc	60	59.0	1.0
	Post Publishing Co	60	59.0	1.0

[1] Initial decision recommending grant.

Mr. Morency. Mr. Ring says that channel 6 can be used, the transmitter to be at Newport. And the map which he furnished shows that not only will it cover Providence, but the transmitter will give a signal in Providence of what is called city-grade service, which is the top-grade service. It would be fully competitive with the two V's which are now assigned there and would solve the problem for the State of Rhode Island. It requires a slight deviation from the Commission's mileage standards. But they are slight, we think, and it would not take much to make that change.

Senator Pastore. I would appreciate having that. Are there any questions?

Senator Purtell. No; except that while there is a question as to who shall get channel 3, channel 3 was allocated to the Hartford area a long while ago, many years ago. And the people that are presently engaged in this controversy as to the assignment of the station itself, both parties are in agreement that it should be retained there regardless of who ultimately gets it; is that correct?

Mr. Morency. I am sure that is right.

Senator Purtell. There is no question on the part of those presently engaged in trying to have this matter determined as to the need, in Hartford, for a very high-frequency station?

Mr. Morency. There is no disagreement on that.

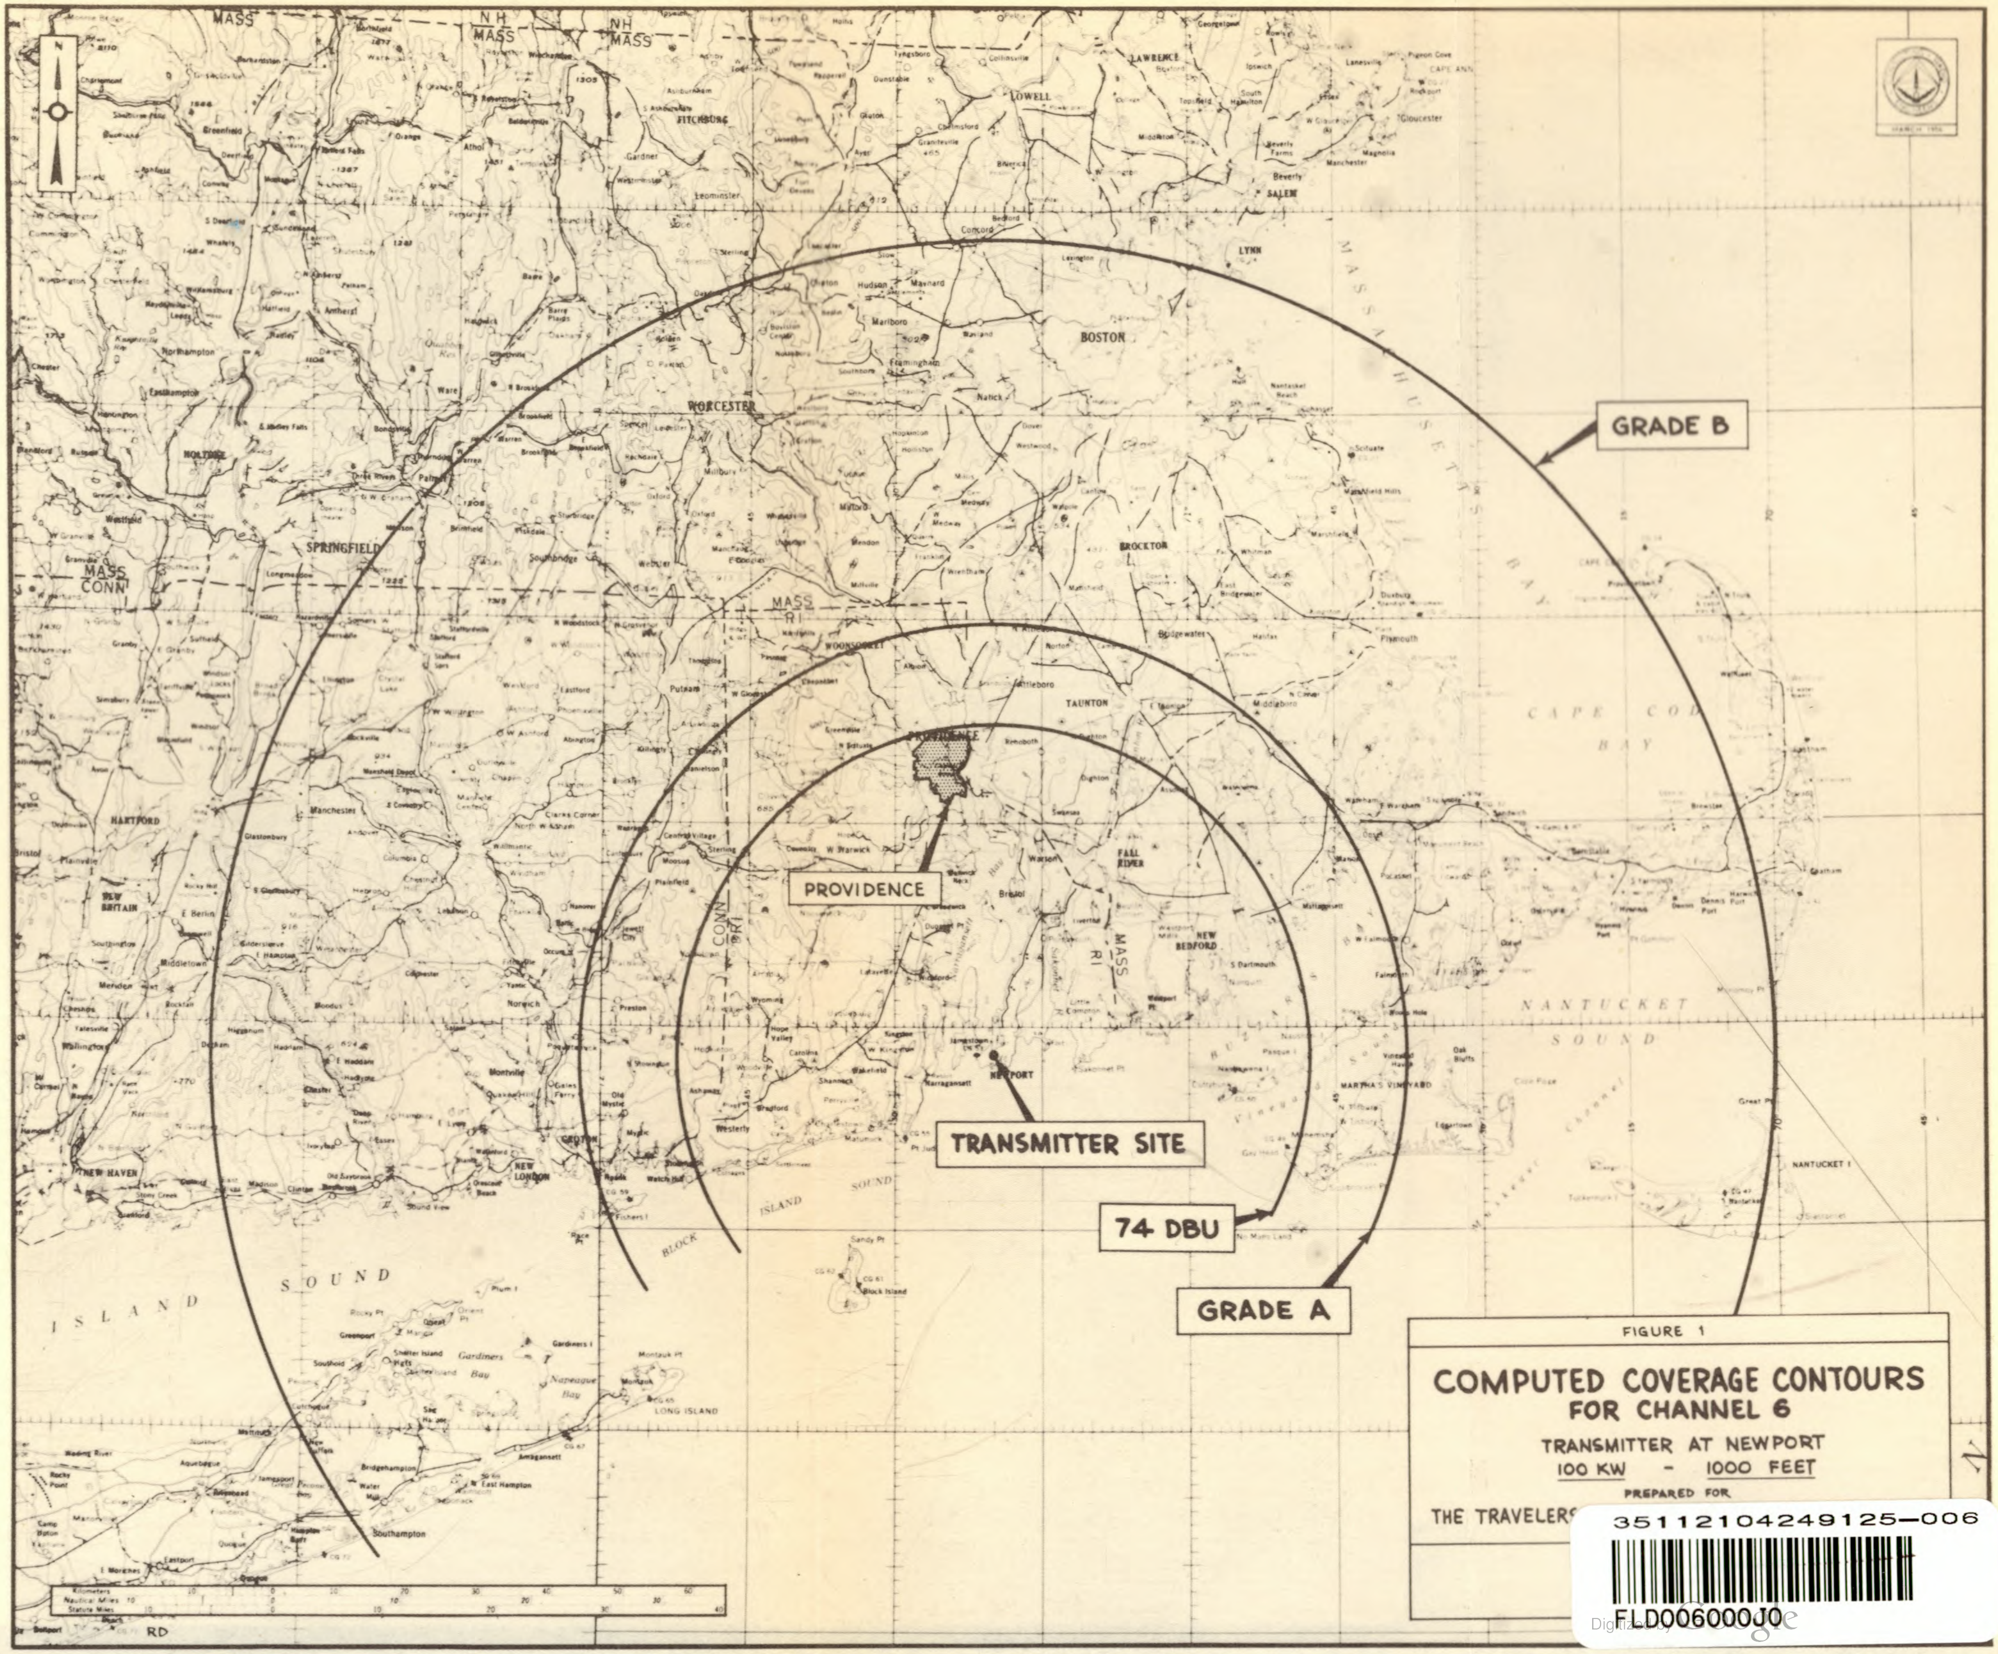
Senator Pastore. Mr. Cox would like to ask some questions.

Mr. Cox. Yes. I can quite sympathize with your difficulties in this very protracted proceeding. But it would not be your position, would it, that your legal difficulties have given you any legal claim upon the channel now in Hartford?

Mr. Morency. Not at all. I think that over the years—certainly we had no equity as such. But certainly consideration should be given, and there should be no lightly considered decision which would delete this channel and delay, for another 3 or 4 years, even the acquisition of a UHF channel.

Mr. Cox. When a third station goes on the air, whether it is on channel 3 or on a U if one were substituted for it, the operator on that channel would have an established set circulation of, I think you said,

75589 O - 56 Pt. 2 (Face p. 674)



375,000 sets which was not there, certainly, when the first U went on the air.

Mr. MORENCY. That is true. WKNB's statement is that there were 13,000.

Mr. Cox. In other words, a latecomer at this stage, regardless of how he gets there and what channel he gets, already has a substantial number of sets, and they are all-channel sets, so it makes no difference what channel he gets?

Mr. MORENCY. Mr. Cox, I really don't like to be designated a latecomer.

Mr. Cox. No, you are a firstcomer—the last one on the air perhaps.

Now, is it your position that channel 3 operated in Hartford will provide a first service?

Mr. MORENCY. Yes, a first good service, definitely, in lots of areas in this northwest section and southwest section of Massachusetts of which I speak.

Mr. Cox. You mention, though, that there are VHF only sets in that area. So, I assume they are getting a signal from more distant points?

Mr. MORENCY. Yes, mostly from channel 8 in New Haven. But I would like to differentiate between a good signal and what people will say is a watchable signal. Most of these people in these areas of which we are now speaking have never see a good television signal, and they deserve to see one.

Mr. Cox. Are these areas within the predictable coverage of your station under the Commission's standards?

Mr. MORENCY. Yes, they are.

Mr. Cox. I think you said there is no difference, really, in power between VHF and UHF stations because of the fact that the Commission had stepped the power up for the higher channels.

Mr. MORENCY. Yes.

Mr. Cox. How about coverage, though? Would a UHF station, operating even at a million watts, have coverage equal to yours at a hundred thousand watts?

Mr. MORENCY. Not quite, no; not in the B coverage. But, as a matter of fact, I think the projections show that they have a greater radius in the A coverage than does channel 3.

Mr. Cox. Class A coverage is somewhat greater geographically, but they drop off more quickly in the other contours?

Mr. MORENCY. The class A coverage is farther, yes.

Mr. Cox. You have pointed out that the four U stations now operating in the Connecticut Valley are not at maximum authorized power. If they were to step up their power to 1,000 kilowatts, would they get substantial additional coverage?

Mr. MORENCY. Substantially what?

Mr. Cox. Additional coverage?

Mr. MORENCY. They would do several things, I think. First, they would make their signal, within the territory they now claim as good coverage, much better.

Mr. Cox. Would it be enough better to overcome the shadow effect that you talked about behind the hills?

Mr. MORENCY. No, sir.

Mr. Cox. It would provide a more sharply defined picture in the area which is not shadowed?

Mr. MORENCY. That is correct. And the difference between a good picture and one that is passable—in my own home, for example, if I want to listen or watch a particular program that is on no other place, I will watch a certain UHF channel which delivers to my house a third-rate signal. If I could get it on a better picture, I would never watch that station.

They need to up their power to give a better picture within their coverage area. I am not talking about beyond. They could do a much better job with a megawatt, a million watts, than they are now doing with 200,000 watts.

Mr. COX. However, this does not give them—there is little or no economic incentive for that, wouldn't that be true in your area?

Mr. MORENCY. Oh, no, that would not be true at all, because what they are suffering from now is a great many second- and third-rate pictures in households where they ought to be first rate, because they don't have power. What would you think of the VHF channel if they had one-fifth the power of these UHF channels? I don't think we would think much of a VHF channel that operated with only 20 kilowatts.

Mr. COX. Would that give you coverage on channel 3 at a lower grade of service?

Mr. MORENCY. Twenty kilowatts would give you coverage of a sort. I am not prepared to tell you just how much less it would give you than the hundred kilowatts, but substantially less.

Mr. COX. Is your statement in your testimony here to the effect that equipment is now available at this maximum of 1,000 kilowatts at less cost than is incurred by VHF channels in obtaining 316,000 watts? Was that based on the testimony before this committee, or do you have independent information on that?

Mr. MORENCY. No. That is based on what I heard here and knew was to be presented.

Mr. COX. You mentioned the fact that there are areas in Connecticut that are shadowed from the present U stations and would be shadowed from your station if you were given a U channel in lieu of channel 3. Isn't it possible to fill those areas in by the use of translators or some other devices, without having a V station in the area to provide that?

Mr. MORENCY. You are now getting over my head, because I am not an engineer. There have been some moves in this direction, in the direction you are talking about. But none of that has—no determinations have been made in that area to my knowledge, and I have watched it pretty carefully. And, so, I would be unable to answer you. I think if you put in a hundred and fifty "kickers" you could cure most of the shadow areas, maybe. But I am talking about small spots where maybe for 700 yards in 1 valley you can't get these UHF signals. Maybe skip a mile; then there are 2 miles that you can't get it.

It is a very difficult problem of solution if you don't do it with VHF from one point; and there is no reason not to, in my opinion.

Mr. COX. I think it is clear, as Senator Pastore said, that you are in a rather unusual position as far as the network affiliation picture is concerned, in that the two U stations there are likely to be owned by networks. I don't know whether you ever indicated, in answer to his question, what your status was with regard to ABC. Have you been negotiating for an affiliation?

Mr. MORENCY. No, we haven't. We have in our grant from the Commission—before the hearing we talked to all the networks, practically. You are now asking me what affiliation channel 3 would have?

Mr. COX. Partly that. And in connection with this quotation that you make from the prospectus of one of these stations in selling stock, you indicated you agreed with him. That is, is it your position, for instance, that channel 3—that you could operate on channel 3 in Hartford without a network and find sufficient programing sources, either from the third network or from independent film sources, to provide a good class of service to the people of the area and a good operation?

Mr. MORENCY. That is our position precisely. We would try to get the best that we could get from ABC. And we would then do a real job on what is available for our major programs on film, and then, thirdly, we would do a maximum local job with local live programing.

Senator PASTORE. What is this about selling stock? Isn't the Travelers Broadcasting Service a subsidiary of the Travelers Insurance Co.?

Mr. MORENCY. It is.

Mr. COX. This was a sale by one of the other stations. They sold some stock.

I take it, then, that you feel that the continued allocation of channel 3 to Hartford, for the reasons you have given, is in the public interest in the sense of providing a good service to people who do not now see it. Is it also a condition to your being interested in a station in the area? In other words, would a UHF channel be as attractive to you economically as the V channel, quite aside from whether certain people would get that service?

In other words, would you not be fully competitive in the area?

Mr. MORENCY. It would be fully as competitive, perhaps. But remember, channel 3 is going to start out without the major network program service, and it is a condition that not many people in the country have really leaped at, even in the VHF cities where they have had, we will say, 3 channels. Some cities where the fourth VHF grant has been made—I think it has not been built in some places.

Mr. COX. Well, now what is Hartford's rank among the national markets?

Mr. MORENCY. Well, it depends on what you include. We will say around 28 or 30.

Mr. COX. Well, now, do most of the markets in that area now support 3 stations, either 3 U's or 3 V's, or do you know that?

Mr. MORENCY. Well, I know that there aren't that many television stations in New England. Boston has only—because of hearings, I think they have only 2 V's on the air, and Providence has 2 on the air, and New Haven has 1 VHF.

Mr. COX. Well, then, your position substantially is that you think that Hartford will support 3 stations if 1 of them is a V, but that it might not support 3 stations if they were all U's?

Mr. MORENCY. No; I didn't mean to say that. I think Hartford will support 3 or 4 stations, period. And——

Senator PASTORE. May I interrupt to say I agree with you?

Mr. MORENCY. Thank you.

Senator PASTORE. And so can Providence.

Mr. MORENCY. Good. [Laughter.]

Senator PASTORE. We are only hoping that we can get them.

Mr. COX. That is all I have.

Senator PURTELL. Well, actually, aside from your particular direct interest in this matter, it is a fact that the Communications Act itself provides that there be an equitable—fair and equitable—distribution of these channels. I understand also, from your testimony here, that there are spots in the State of Connecticut—and I have it from other sources too—that cannot get a good signal except from any very high frequency station. Is that correct?

Mr. MORENCY. That is right.

Senator PURTELL. So in addition to having another station, your testimony indicated you would not only have another station, but you would have a station that would be a very high frequency station, which would be able to cover more people in the State of Connecticut who are presently not getting good signals, and would serve a better purpose in the public interest.

Mr. MORENCY. That is true. Section 307 (b) of the statute calls for equitable distribution.

Senator PASTORE. The reason why I raised that question about New York—as long as you have seven in New York and a scarcity of them in other parts within the radius that can be serviced from there, you have a problem. If you had more equitable distribution, I think that that would be a step in the right direction. How you are ever going to do it, I don't know. That is the problem.

Thank you very much, Mr. Morency.

Senator PURTELL. I might say, before you go, that in the light of the fact that we have had many most pleasant passages between Senator Pastore and the junior Senator from Connecticut, I was very happy to have you offer what appears to be a very fine solution to the problem of the Senator from Rhode Island, by suggesting that channel 6 be allocated there.

Mr. MORENCY. Thank you.

Senator PASTORE. I hope he is right. We will adjourn at this time until tomorrow morning at 10 o'clock.

(Whereupon, at 4:17 p. m., the committee was recessed, to reconvene 10 a. m., Thursday, March 15, 1956.)

TELEVISION INQUIRY

THURSDAY, MARCH 15, 1956

United States Senate,
Committee on Interstate and Foreign Commerce,
Washington, D. C.

The committee met, pursuant to adjournment, at 10:50 a. m. in room P-38, United States Capitol, Senator Andrew F. Schoeppel, presiding.

Present: Senator Schoeppel.

Senator Schoeppel. Let the committee come to order, please. The record will show we are reconvening on this series of hearings this morning.

Let the record also show that the statement of Paul R. Bartlett, California Inland Broadcasting Co. of Fresno, Calif., has been submitted and will become a part of the record.

STATEMENT OF PAUL R. BARTLETT, PRESIDENT, CALIFORNIA INLAND BROADCASTING CO., FRESNO, CALIF.

Mr. Bartlett. My name is Paul R. Bartlett. I am president of California Inland Broadcasting Co., permittee of channel 12 at Fresno, Calif.

We filed for VHF channel 12 in 1952. As another applicant also applied for channel 12, we had to go through lengthy comparative hearings and it was not until January 11, 1956, that we were finally granted a permit to operate on channel 12. We plan to be on the air within the next 3 or 4 months.

During the 4 years which we were going through a lengthy and expensive comparative hearing for VHF channel 12, three applicants for UHF stations in Fresno received grants without going through a hearing, and as a result have had a 2- to 3-year head start. McClatchy Broadcasting Co. was granted its construction permit on UHF channel 24 on September 17, 1952; O'Neill Broadcasting Co. was granted its construction permit on UHF channel 47 on April 8, 1953; and John Poole Broadcasting Co. was granted its construction permit on UHF channel 53 on August 12, 1953. After a short period of operation on UHF channel 53, the John Poole Broadcasting Co. closed down its operations. Therefore, at the present time there are only two UHF stations and no VHF stations operating in Fresno.

To date, Fresno has been a so-called UHF island. There is no conversion problem there, as all receivers can receive UHF as well as VHF. Advocates of UHF have argued that deintermixture of markets such as Fresno into UHF islands is the cure for UHF's problems. I disagree with these arguments, since I believe that it is clear that deintermixture will not accomplish the objectives of creating a greater number of stations in communities such as Fresno, nor will deintermixture enhance the prestige of UHF with national advertisers. Indeed, deintermixture in all probability may cause exactly the opposite result.

The situation in Fresno well illustrates the proposition that deintermixture will not increase the amount of service available to the public, but in all probability will permit less service. As already noted, at the present time there are only two UHF stations operating in Fresno, with a third UHF having gone off the air. Our VHF service on channel 12 will bring a new third service to Fresno which was not possible with UHF. Certainly, with all receivers in the area converted to UHF and with a 3-year head start in operations, the 2 existing UHF stations should have little difficulty in competing with our new VHF service, and the public will benefit from a new and additional service, which will be the only VHF service possible in the Fresno area under the allocation plan. However, even if we cannot succeed with our VHF operation in competition with the 2 UHF stations or if 1 of the UHF stations should subsequently fail, Fresno will still have 2 services, which is exactly what it has now. In any event, our new VHF service is the only chance that Fresno has for a third service. Furthermore, our VHF station will make available service to sparsely settled areas in the Fresno area which admittedly are not now covered by the existing UHF stations.

To recapitulate, if Fresno cannot support three television stations, it is not because of any competitive technical advantages or disadvantages between VHF and UHF, since a third UHF station has already failed there without any competition whatsoever from VHF. If Fresno can support only 2 stations, it will make little difference to the public whether they are UHF or VHF or a combination thereof, with the exception that with at least 1 VHF station, some members of the public in the Fresno area will receive television service who would not receive such service if it were limited to all UHF.

In answer to those who have predicted in this hearing that UHF service may fail in Fresno when we start our VHF service in the near future, I would like to state that our VHF service will have very formidable competition from the existing UHF stations. Thus, the McClatchy interests, which own 1 of the operating UHF stations in Fresno, also own and operate 5 radio stations and several newspapers in the central California area in which Fresno is located. The McClatchy group with their powerful backing and dominant position over communications media of all forms in this area can undoubtedly meet any competitor, VHF or UHF, on more than equal terms. The O'Neill Broadcasting Co., the other UHF operator in Fresno, is owned by one of the major industrialists in the central California area, who has numerous other business interests and operates his television station more or less as a sideline.

Mr. O'Neill's manifold business interests in the Fresno area also give him unusual opportunities to obtain the inside on local advertising in Fresno. As compared to our two UHF competitors, who have numerous other business interests in the central California area, our interests are limited to that of running a radio and television station in Fresno.

As numerous UHF witnesses have testified in this proceeding, in communities such as Fresno where only one VHF station is allocated, UHF stations can survive and prosper. I do not believe that anyone can argue with logic or persuasion that our new operation on VHF channel 12 will cause both of the other operating UHF stations to go off the air. Certainly Fresno, with a metropolitan population of approximately 150,000 and a market area population of almost 1 million, which supports 6 radio stations, can support more than 1 television station.

I find it equally difficult to understand testimony in this hearing to the effect that the creation of UHF islands would enhance the prestige of UHF and thus give it a psychological boost with national advertisers. As an illustration, in the State of California, the markets of San Francisco-Oakland, Sacramento, Bakersfield, and Fresno are each allocated UHF and VHF channels on an intermixed basis. With the exception of Fresno, all markets now receive service from both VHF and UHF stations. In Fresno there are now two operating UHF stations, and we have recently received a grant on a VHF channel. In these four markets, there has been a substantial measure of conversion to UHF, ranging from approximately 25 percent in 1 year in San Francisco-Oakland to nearly 100 percent in Fresno and Bakersfield.

Suggestions have been made by UHF proponents that these 4 markets be deintermixed by making Fresno an all-UHF market and the other 3 cities all-VHF markets. Now it is difficult for me to conceive how the prestige of UHF will be in any way enhanced with national advertisers if UHF is deleted from San Francisco-Oakland with 707,358 television households, from Sacramento with 82,773 television households, and from Bakersfield with 10,884 television households, which would leave Fresno as the only UHF island in this California area with 80,380 television households. These figures represent only the metropolitan area, and figures for the total coverage area would be relatively larger. If San Francisco-Oakland, Sacramento, and Bakersfield become deintermixed to all-VHF markets, then the number of television households which would be potential UHF homes in the 4 markets would be reduced from 881,395 to 80,380. Clearly, the elimination of UHF from such important markets as San Francisco-Oakland, Sacramento, and Bakersfield would serve to diminish, rather than enhance, the importance or stability of UHF in the minds of national advertisers. The few UHF islands created by deintermixture would in effect be branded as the leper colonies of television requiring complete isolation.

We must also consider that if the four markets of San Francisco, Sacramento, Bakersfield, and Fresno are deintermixed by making the first three all-VHF and Fresno all-UHF, that Bakersfield and Sacramento for all time in the future would be limited to 2 stations each and San Francisco-Oakland to 5 stations, since this appears to be the maximum possibility of VHF channels for these 3 communities. There does not appear to be any justification for artificially restricting these markets to this limited number of stations. I am also optimistic enough to believe that there are numerous markets in which new UHF stations will come into being within the next few years, despite some of the pessimism which has been expressed here. The networks require additional outlets in many markets, and if UHF is left alone, it will undoubtedly be utilized and receive network affiliations.

Deintermixture and the creation of UHF islands would also reduce the incentive of the manufacturers of receivers to standardize upon one type of all-channel receiver capable of receiving both UHF and VHF. It is readily apparent that the greater the number of markets and buyers that demand UHF the more incentive there will be for manufacturers to meet this demand. However, selective deintermixture would reduce the number of markets for which manufacturers will have to supply all-channel sets and will reduce the overall national demand for such UHF sets. This result can be demonstrated in connection with the previously mentioned markets of San Francisco-Oakland, Sacramento, Bakersfield, and Fresno.

All four of these markets are now intermixed and have, or will have in the near future, both UHF and VHF operating stations. Therefore, under present circumstances, manufacturers have a potential market for all-channel receivers in these 4 markets of $881,395 households in the metropolitan areas alone. However, if Fresno were made a UHF island and the other 3 markets became all-VHF markets, the potential market for UHF receivers would be reduced by approximately 91 percent from 881,395 to 80,380 television households. Under such circumstances, the only market to which manufacturers would send UHF sets would be Fresno. Aside from this, a substantial number of viewers in San Francisco-Oakland, Sacramento, and Bakersfield who have invested in UHF sets to date will have lost their investment if these three markets are deintermixed. If this should happen, it is clear that the reputation of UHF would be blackened for all time with those persons in these three markets whose UHF sets were made obsolete by deintermixture.

Despite some apparent contradictions in isolated situations, I believe no one can seriously challenge that, if we are to have a television system providing service to all people of the United States which at the same time permits the greatest number of competitive stations to the largest possible number of communities, intermixture of UHF and VHF must continue. In my opinion, the mere fact that a number of UHF stations have failed, or are threatened with failure, does not repudiate this conclusion, for, after all, a substantial number of VHF stations have also failed. Thus, the Commission's most recent financial data shows that 92 VHF stations were in financial distress, as compared to 104 UHF stations suffering such distress. It is apparent, therefore, that, insofar as this hearing is concerned with business failures and financial distress, both UHF and VHF have problems in common.

Economic studies of the industry made by such eminent authorities as Dr. Alexander of CBS indicate that the problem of these business failures would undoubtedly still be with us even though television were all VHF or all UHF. In any event, the problem confronting both UHF and VHF cannot be solved by separating one from the other by deintermixture.

All of us, of course, are interested in new ways to increase and improve the present television service to the public. However, I believe that the testimony in this proceeding to date reveals all too clearly that deintermixture would not serve to improve or increase service but, rather, would tend to destroy the potential which UHF has of ultimately making important contributions to a national competitive television system.

Thank you.

Senator SCHOEPPEL. The next witness to be heard is Elmer Engstrom, senior executive vice president, Radio Corporation of America. We will be glad to hear from you, sir.

STATEMENT OF DR. ELMER W. ENGSTROM, SENIOR EXECUTIVE VICE PRESIDENT, RADIO CORPORATION OF AMERICA

Mr. ENGSTROM. My name is Elmer W. Engstrom and I appear on behalf of the Radio Corporation of America. I am senior executive vice president of RCA and my office is at 30 Rockefeller Plaza, New York City. I am appearing at the invitation of this committee to discuss the status of transmitting and receiving equipment for UHF television.

First I want to express to this committee RCA's appreciation for affording us the opportunity to come before you and give testimony. We believe that this hearing can serve a very useful and constructive purpose in developing the facts regarding UHF television, its problems and its possibilities.

It may be helpful to the committee if I first summarize the subjects that I propose to cover in my statement. An understanding of the development of the UHF frequency band is important, it seems to me, in order to appraise in its true perspective the present technical position of UHF television. I propose, therefore, to review briefly some of RCA's work in the UHF.

Conditions of propagation of radio waves at UHF differ from the conditions existing at VHF. Performance of apparatus at UHF differs from performance at VHF. UHF, being more recently developed than VHF, is still to some extent in the pioneering stage.

I shall review the present status of transmitting equipment and receivers for UHF television. Then I shall point out some of the important differences between UHF and VHF for television service. I shall indicate whether or not current apparatus is limiting and what significant improvements may be expected. Finally, I shall propose certain matters for consideration and decision which, in my opinion, might aid UHF television. I shall do this against a background of experience as related to the technical performance of television on the UHF channels.

Mr. Chairman, as I indicated earlier in my statement, I do feel that a recitation of the history of the early work in developing UHF and RCA's part—because we have had an important part in this—is important to the record. But in order to save the committee's time, I should like to have that included in the record, but so far as my oral presentation is concerned, I should like to move to page 7 of my statement because we get more directly into the problem that concerns this committee.

Senator SCHOEPPEL. That will be quite all right, and let the record show that the entire statement will be included in the record. I understand you are moving now to page 7?

Mr. ENGSTROM. I am moving to page 7 and I am beginning with the section which is entitled "Television's need for more channels."

Senator SCHOEPPEL. Proceed.

RCA'S WORK IN DEVELOPING UHF

Mr. ENGSTROM. RCA has been engaged in development work in the ultra-high frequencies for more than 20 years. We know of no other organization which has devoted as much time and as much engineering effort to the development of the UHF band. This expenditure involved the utilization of more than 2 million engineering man-hours by RCA scientists and engineers.

The UHF television band, as you may know, is only a part of the band of frequencies which is called the UHF. The UHF portion of the spectrum extends from 300 to 3,000 megacycles. The television band in the UHF covers from 470 to 890 megacycles.

Many radio services operate in the UHF. Some of these services, in addition to television, are aeronautical radio navigation; remote pickup for broadcast stations; land transportation, which includes trucking; public safety, which includes such services as police and fire departments; citizens radio; many Government radio services and radio relays such as those for turnpikes and telephone companies. Many of the components used in transmitting and receiving equipment for one UHF service may be the same as or similar to those used in equipment for another UHF service. Thus, RCA's extensive development work in the UHF band has had application to many radio services.

SEARCH FOR SPECTRUM SPACE

The search for space in the radio spectrum to accommodate the constantly increasing number of radio services has been going on since shortly after the invention of the three-element electron tube. Before the appearance of that tube, radio communications were limited mainly to contacts between ship-and-shore stations. The need for more spectrum space for this purpose was not critical and radio traffic congestion, when it did exist, could be blamed more properly on the crude apparatus in use rather than on any real scarcity of available wave lengths. The coming of the versatile electron tube, however, opened up a wide variety of uses for radio signals, many of them far removed from the original marine wireless applications.

Prior to the early 1930's, the UHF spectrum was a no-man's land presenting formidable obstacles to those who attempted to examine and utilize its widespread areas. Actually, however, these obstacles were not unexpected. For many years substantial technical problems had been anticipated whenever the theory of wave propagation at high frequencies was examined by scientists. Because the possibilities of this portion of the radio spectrum were admittedly tremendous, the UHF became a challenge to scientists and engineers despite the magnitude of the problems to be faced.

RCA DEVELOPS FIRST SUCCESSFUL UHF RECEIVING TUBE

Early technical progress was slow. Electrons, which were easily controlled when generated for the lower frequencies, were difficult to regulate at UHF. Tubes that functioned well at lower frequencies were practically useless in the higher frequency parts of the spectrum. Components and circuits, which had been developed for use at frequencies up to 300 megacycles, could not be depended upon to function at higher frequencies.

The first practical receiving type electron tube to operate successfully in the UHF was a unique "acorn" tube developed by RCA engineers in 1933. The production of this tube was an important factor in breaking the logjam which theretofore had held up UHF development.

Also in 1933, RCA engineers working in laboratories at Rocky Point and Riverhead, Long Island, produced 2 UHF transmitters which would operate on 462 megacycles with a power of several watts. After preliminary local tests, communication was established between the 2 towns, a distance of 14 miles. Later, when a 100-watt transmitter was developed, steps were taken to study the effect of greater distances on UHF transmissions, using a frequency of 411 megacycles. A small portable receiver and antenna were devised and mounted in an automobile to permit signal tests at greater distances from Rocky Point.

The experience and data obtained as a result of these early tests, particularly as they related to the sending of signals over the terrain involved and the relation of output power to reliable communications, marked an important step forward.

RCA-NBC OPERATE FIRST UHF RADIO RELAY FOR TELEVISION

RCA and NBC engineers built and operated a radio relay which was used in January 1941 to transmit for the first time a television program picked up at a remote point and relayed by the use of UHF frequencies. An NBC mobile television truck at Camp Upton, Long Island, picked up scenes of Army recruits in training, transmitting the resulting signals over a radio circuit, operating on frequencies near 500 megacycles, to a tower near Hauppauge, Long Island, a jump of 17 miles, thence to a second relay at Bellmore, Long Island, 22 miles distant, and finally direct to New York City, another hop of 28 miles.

In April 1945, an experimental 2-way microwave circuit, using frequencies in the order of 3,300 megacycles, was placed in operation between Philadelphia and New York City. Two relay points for the 84-mile span were selected, one 37½ miles from New York and the other 26½ miles from Philadelphia. Hundred-foot towers were erected at the repeater stations with experimental equipment housed in enclosures on each tower top.

UHF SYSTEMS DESIGNED BY RCA

RCA has designed and manufactured UHF microwave equipment for various trunpikes including the New Jersey Turnpike, the Ohio Turnpike, and the Pennsylvania Turnpike. Utilizing radio channels higher in frequency than the UHF television band, these systems employ a number of UHF relay stations to pass the signals from one end of the highway to the other.

Interconnections between various field headquarters of Allied Air Forces in Central Europe utilize RCA-built UHF equipment.

RCA has also manufactured and sold UHF microwave communications systems for various municipal, State, and other governmental agencies, pipeline companies, electric utilities, and telephone companies.

I have briefly outlined these various diverse facets of work by RCA engineers in the UHF preliminary to discussing our work specifically directed to television broadcasting in the UHF. I have done this because, in considering and evaluating the present status of UHF television broadcasting, it is important to remember that, only a short time ago, any radio use of the portion of the spectrum above 300 megacycles was not commercially feasible. Only within compartively recent years has it been possible to utilize the UHF band commercially.

TELEVISION'S NEED FOR MORE CHANNELS

The Federal Communications Commision early realized it would have to find additional space into which television service could expand. Because a television signal takes about 600 times as much space in the frequency spectrum as a standard sound broadcast signal, the promise that television would expand as a postwar service to the public was a major factor in bringing the higher frequencies to the forefront.

In 1945 the Commission tentatively set aside the UHF band from 480 to 290 megacycles for experimental television broadcasting.

As part of its report of May 25, 1945, providing for this allocation, the Commission stated:

> The Commission repeats the hope * * * that all persons interested in the future of television will undertake comprehensive and adequate experimentation in the upper portion of the spectrum. The importance of an adequate program of experimentation in this portion of the spectrum cannot be overemphasized, for it is obvious from the allocations which the Commission is making for television below 300 megacycles [VHF] that in the present state of the art the development of the upper portion of the spectrum is necessary for the establishment of a truly nationwide and competitive television system.

PROMPT RESPONSE OF RCA AND NBC

RCA and NBC promptly undertook further tests at these higher frequencies. In 1946 and 1947 there were tests using frequencies of 288, 510, and 910 megacycles.

These tests showed the necessity of increasing the radiated power with any increase in frequency. Accordingly, our engineers designed and installed high-gain unidirectional antennas on the 97th floor of the Empire State Building. In addition, new and improved models of UHF transmitting equipment were designed and installed. Although not of broadcast caliber, these transmitters served to extend the propagation studies through the UHF television range before better transmitters were available.

The tests and surveys also indicated that more power would be necessary for a UHF station to serve the same relative area as a VHF station. Nevertheless, it was also apparent that UHF could be developed so that, under proper conditions, it could render service to the public as a broadcasting medium.

UHF TELEVISION SYSTEM INSTALLED IN WASHINGTON

After the May 1948 announcement of the Commission that hearings would be held to obtain information on possible utilization of 475 to 890 megacycles in the UHF band for television broadcasting, RCA and NBC decided to continue the tests in Washington rather than in New York so that the experience would be directly available to those participating in the hearings. A complete television system operating in a 504 to 510 megacycle channel was installed at what is now the Sheraton-Park Hotel. Fifty home receiver installations were made throughout the Washington area to check the results of these transmissions. With antennas on the WNBW (WRC–TV) tower radiating the same program at both the UHF and the VHF, it was possible for us for the first time to compare directly results at the UHF and at the VHF under similar conditions.

Analysis of the data corroborated the conclusions reached as a result of previous tests that significantly higher radiated power would be required for television at the UHF than at the VHF. In addition, it was evident that shadow effects, because of buildings and rugged terrain, were more pronounced in the UHF than in the VHF frequency band.

RCA BUILDS FIRST COMMERCIAL-TYPE UHF STATION

In 1949 RCA and NBC established near Bridgeport, Conn., the first commercial-type UHF television broadcasting station. The station went on the air December 29, 1949, using the band of ultrahigh frequencies between 529 and 535 megacycles. Later a second transmitter, operating on 850 megacycles, was also installed by us at Bridgeport to permit a study of transmission and antenna techniques at the upper end of the UHF television band.

For more than 2 years this experimental station rebroadcast on a regular basis programs picked up from WNBT (WRCA–TV) in New York by means of a 2,000 megacycle microwave relay direct from the Empire State Building. UHF television receivers were built and placed in homes in and around Bridgeport. To supplement the data derived from reports of home viewers, we also equipped a mobile receiving unit to make additional tests.

The data obtained were analyzed and prepared as a full report, copies of which were filed with the Federal Communications Commission. In addition, RCA and NBC engineers published the data in technical papers so that all segments of the television industry would have access to the information.

Representatives of the FCC, of virtually every electronics manufacturer, and many broadcasters came to Bridgeport to visit this experimental station and to observe for themselves what it could do. Many manufacturers utilized the Bridgeport UHF signals as an aid in their development of UHF receivers and antennas.

On April 14, 1952, the FCC issued its new allocation plan, effective July 1, 1952, setting aside 70 UHF channels for television.

The first commercial UHF station to go on the air following this action of the Commission was Station KPTV in Portland, Oreg., equipped by RCA. The equipment was that which had been used by the Bridgeport experimental UHF television broadcasting station, and the station commenced operation in September 1952.

UHF TRANSMITTING EQUIPMENT

RCA work in developing improved UHF transmitters was well underway at the time the Commission in 1952 authorized UHF broadcasting on a commercial basis. The first UHF transmitters sold by RCA for commercial television had a power of 1 kilowatt. The effective radiated power provided by this transmitter was greater than 1 kilowatt, however, because of the gain provided by the transmitting antenna.

Transmitting antennas may be built so that the signal transmitted is concentrated in the region just above the surface of the earth. Thus, signal energy is not wasted by useless transmission upward. This effectively provides a signal which is stronger than would be the case with a simple antenna. Such antennas are rated in terms of a gain factor which expresses the signal transmitted as though it came from a transmitter of a power greater by this gain factor. For the period I am now discussing, RCA transmitting antennas for the UHF were available with a power gain of 20 or more. Thus, with the 1-kilowatt UHF transmitter, an effective radiated power of more than 20 kilowatts could be provided.

Meantime, development work was in progress at RCA with respect to higher power transmitter tubes together with the unique circuitry required for each, looking toward higher transmitter power. As a result of intensive development work, an appropriate power tube and a 12-kilowatt UHF transmitter were produced by RCA. A number of these UHF transmitters have been sold by RCA and are operating with effective radiated powers in the order of 250 kilowatts.

HIGH-GAIN UHF TRANSMITTING ANTENNAS

At the same time, development work on UHF transmitting antennas was in progress. Efforts were first directed toward contouring the pattern of the antenna which was used with the 1-kilowatt and 12-kilowatt UHF transmitters. Knowledge gained in this work led to the possibility that omnidirectional antennas with gains in the order of 50 could be built. Utilizing such an antenna and 2 RCA 12-kilowatt amplifiers operating in parallel, the first equipment of 1,000 kilowatt effective radiated power went on the air in December 1954, at Station WBRE–TV, Wilkes-Barre, Pa.

There have been new developments in addition to the high-gain UHF transmitting antenna. For example, early last year RCA announced a UHF 25-kilowatt transmitter utilizing a 25-kilowatt tube. This transmitter, when used with the high-gain antenna to which I have just referred, provides an effective radiated power of 1,000 kilowatts. The new transmitter also provides improved operating efficiency and a lower initial capital investment per kilowatt of output power as contrasted with our earlier transmitters.

At the present time, the maximum effective radiated power permitteed by the rules of the Federal Communications Commission is 316 kilowatts for high band VHF stations and 1,000 kilowatts for UHF stations. Equipment costs for such a maximum power VHF station and such a maximum power UHF station are approximately the same and operating costs for power and tubes are likewise of the same order.

HIGHER POWER PROPOSED FOR UHF TELEVISION

In a notice released June 24, 1955, the Commission proposed to amend its rules to increase the maximum permissible effective ratiated power for UHF stations from 1,000 kilowatts to 5,000 kilowatts.[1] RCA supported the proposal of the Commission and stated

[1] FCC Docket No. 11433. By Commission order released December 15, 1955, Docket No. 11433 was terminated and the record made a part of Docket No. 11532.

in its comments of August 31, 1955, that in its opinion the higher power proposed by the Commission for UHF would result in improving coverage and service provided by UHF television stations. RCA advised the Commission it was continuing its development work on higher power UHF tubes, circuits, filterplexers and antennas. This was with the objective of providing equipment necessary for UHF television stations to operate at higher effective radiated power levels, such as 5,000 kilowatts, if such power levels were authorized by the Commission. It was further stated by RCA that early approval of higher power by the Commission and customer demand would, of course, accelerate the time when commercial models of such equipment would be available. The Commission still has this matter under consideration.

HIGHEST POWER ACHIEVED FOR UHF TELEVISION

In recent months RCA's development work on higher power has resulted in achieving, to the best of our knowledge, the highest power ever developed for UHF television. On January 13 this year, a test was conducted at the RCA tube plant at Lancaster, Pa., coupling an RCA high-gain UHF antenna to an experimental transmitter using a developmental superpower tube to produce 4,500 kilowatts of UHF television effective radiated power at a frequency of 527 megacycles. This power was obtained by feeding approximately 100 kilowatts, generated by this new tube, into the antenna which had a gain of about 46.

Several weeks later further tests were made operating the transmitter at an average power of 100 kilowatts and intermittently pulsing it up to a level of 175 kilowatts. This is an approximation of operating conditions using a television signal. With an antenna gain of 46, this gave a peak effective radiated power of approximately 8,000 kilowatts.

UHF BOOSTER STATIONS

In 1954, RCA made plans to conduct tests to determine the extent to which booster operation could aid in the coverage of UHF television stations.

After a lengthy study of a number of areas in order to find a site for carrying out a full scale booster operation, RCA selected station WJTV, channel 25, in Jackson, Miss., as appropriate for these tests. This station, with an effective radiated power at that time of 17.7 kilowatts, was reported to be having trouble in covering Vicksburg, Miss., located about 35 miles west of the station. A substantial portion of Vicksburg was shielded from the station by a ridge of hills.

A survey was made in the neighborhood of Vicksburg to determine whether there were any receiving sites where a reasonably noise-free picture could be obtained to feed the booster station. Several such locations were found and one of these was chosen as the site for the booster. Equipment we had developed was installed at this site in cooperation with station WJTV.

A detailed report concerning the Vicksburg tests entitled "An Experimental Investigation of the Engineering Aspects of a UHF Booster Installation," was sent by us to the Federal Communications Commission on August 4, 1954.

These tests were referred to in RCA's comments of July 20, 1955, filed in a rulemaking proceeding which was instituted by the Federal Communications Commission by notice released March 31, 1955 (FCC Docket No. 11331). The purpose of the proceeding, the Commission stated, was to determine whether booster stations would constitute a feasible means for increasing the effective coverage of UHF television stations by filling in shadow areas within the nominal service areas of such stations. We stated our conclusion to be that, although conditions in the particular area and other technical means of providing statisfactory coverage must be carefully considered, in certain locations booster operation can aid in increasing the effective coverage of UHF television stations in their service areas. The Commission still has this matter under consideration.

UHF RECEIVING EQUIPMENT

While RCA was engaged in development work on UHF transmitting equipment, work was also in progress at RCA on the further development of UHF television receivers and receiving antennas.

When the first commercial UHF television station began operation in Portland, Oreg., in September 1952, we manufactured and sold three types of converters for existing VHF receivers. These were a continuous all-channel converter, a two-channel converter and a single-channel converter. In addition, we manufactured a VHF–UHF receiver which employed a 16 channel step-type tuner with separate circuit elements for each channel, any number of which might be provided with UHF tuning elements. In June 1953, we introduced a continuous all-channel UHF tuner which, in conjunction with the step-type VHF tuner, provided complete coverage of all television channels. We introduced a new and improved UHF tuner in June 1954, which also provided for continuous coverage of all UHF channels. The RCA line of receivers introduced in mid-1944 included receivers having all-wave tuners which incorporated further improvements.

Senator SCHOEPPEL. Might I interrupt there, sir. What was the differential in costs on those?

Mr. ENGSTROM. I am going to come to that, at least so far as the present situation is concerned.

Senator SCHOEPPEL. Thank you.

IMPROVEMENTS IN UHF RECEIVER PERFORMANCE

Mr. ENGSTROM. Substantial improvements in UHF receiver performance have been made during the past few years.

One measure of this improved performance relates to the strength of signal required to produce a noise-free picture, that is, a picture free of a noise effect which has the appearance of snow. This in technical terms is referred to as noise factor and is defined in terms of decibels of noise above an arbitrary level. On this scale, the lower the numerical figure in decibels the better the performance of the receiver in this regard.

Noise factors on production units, which ran as high as 18 to 25 decibels in some early receiver designs, now average from 11 to 14 decibels in such units. This means that UHF receivers we build today will give a satisfactory picture on a weaker signal than would earlier models. However, noise factors of UHF receivers, even though they have improved, are still not comparable to those of VHF receivers. In VHF receivers we manufacture at the present time noise factors average between 4 and 7 decibels.

Another improvement in performance relates to the spurious radiation from the receiver itself. Such spurious radiation affects other television receivers in the immediate neighborhood. The Commission has specified levels for this spurious radiation, which are 500 microvolts per meter at 100 feet for the UHF band, to be effective at a future date.

In RCA receivers, spurious radiation has been reduced from about 3,000 microvolts per meter at 100 feet 3 years ago to a level of about 500 microvolts per meter at 100 feet in UHF television receivers presently being manufactured.

Through experience gained from customer use of UHF receivers, design changes have brought about improvements. For example, we feel that the ease of tuning a UHF receiver has been improved.

Development work has proceeded on special types of receiving antennas for UHF and on improving the performance of transmission lines between a UHF antenna and the receiver. This improved equipment is now in customer use.

RCA is continuing its development work with regard to circuits, tuner design for VHF and UHF channels, receiving tubes and antennas, with a view to bringing about further improvement in the performance of UHF television receivers.

RCA PROMOTES SALE OF UHF RECEIVERS

It has been the policy of RCA to promote the sale of all-channel VHF-UHF television receivers. All color television sets we have manufactured up to the present time can receive all VHF and UHF television channels. Our black-and-white television receivers can be purchased by customers, if they desire to do so, as all-channel VHF-UHF receivers.

When we introduced our line of black-and-white television receivers during mid-1955, we reduced the nationally advertised retail-price differential between our all-channel set and a VHF only set to $25. This compared with the $50 to $60 differential which existed when we first introduced UHF tuners in our sets, and represented a reduction of more than 50 percent. The price differential which will apply to the new line of black-and-white television sets which we will introduce during mid-1956 has not as yet been determined.

The percentage of RCA's total production of black-and-white television receivers which is all-channel VHF–UHF is well above the average of the balance of the industry, in fact, approximately 40 percent above for the year 1955. However, the year-by-year industry trend with respect to the percentage of production of all-channel receivers is not encouraging. For the total yearly industry production of black-and-white receivers, the percentage of all-channel sets was 19.6 percent in 1953, 19.9 percent in 1954, and 15.2 percent in 1955.

NECESSARY TO UNDERSTAND TELEVISION PERFORMANCE AT UHF

It is necessary to understand how television performs at UHF in order to be certain, or at least confident, of practical success in tackling UHF problems. In general it is not proper to assume performance equal to VHF for reasons I have already outlined. This is not a new concept; it is one which became clear during the pioneering test period of television at UHF.

As I have already indicated in my statement, the Federal Communications Commission, at an early date, encouraged development work above 300 megacycles. This region was at one time thought to be the part of the frequency spectrum where color might have its beginning. Our experience during the late 1940's indicated, however, that color should have its start in VHF and expand to UHF.

In this connection on September 29, 1949, I testified before the Federal Communications Commission as follows:[2]

During the period of our UHF propagation tests and surveys, I held frequent discussions with two of my associates, Dr. Brown and Mr. Kell, because we became increasingly cognizant of the magnitude of the problem of broadcasting color television at UHF. This problem we saw was one for which the solution would surely come but would be slow in coming. We also saw that it would be necessary to make appropriate changes in the concepts of what UHF would do and that direct comparison to or equivalence with the low VHF channels was not appropriate. In presenting our data on the UHF tests we were careful to be realistic but at the same time avoid any overemphasis of the difficulties. Even so, we knew that others considered and said that we were too pessimistic in our statements. On this point, however, the passage of time is making clear what the real situation is.

There are differences between the propagation characteristics of the lower group of VHF channels as compared to the higher group of VHF channels. There are likewise differences between the VHF channels and the UHF channels and, again, between the UHF channels at the lower end of the band as compared to those of the upper end of the band. These differences are such that it is progressively more difficult, as the channel number or frequency becomes higher, to provide a usable signal in areas of tall buildings, rugged terrain and hills and valleys. It is more difficult for the higher frequency signals to penetrate, and there is less tendency for the signal to fill in or heal on the other side of an obstruction. These are conditions of nature. Increases in transmitter power are in the right direction to help, but cannot completely compensate for the very difficult situations.

A practical UHF receiving antenna is smaller in size than a VHF receiving antenna. A UHF antenna, therefore, intercepts less signal than a VHF receiving antenna. As I have already explained, UHF receivers require a stronger signal, particularly in any fringe or low signal area, than do VHF receivers if the picture is to be free of noise interference. Here again increases in transmitter power move in the right direction to aid in UHF.

In discussing the status of UHF television transmitters, I indicated that transmitters and antennas are available today which go to the top limit permitted under the existing FCC rules. I also indicated that RCA has developed new UHF tubes which may be used in transmitters and which may have effective radiated powers of the higher levels contemplated by an FCC proposal on which final action has not yet been taken.

Tubes and circuits for UHF television receivers will continue to be improved. Here it is my opinion that progress will be gradual and slow. There are modest improvements in sight, but there is no sig-

[2] FCC Docket Nos. 8736 et al., transcript of hearings, p. 2657.

nificantly large improvement on the immediate horizon. This is a research and development area which has received much attention during the past 10 or more years. It is from this experience that the above statements are made. One must, therefore, proceed to use performance characteristics of the general order of today's receivers, keeping in mind gradual improvements, in defining UHF service areas.

When VHF and UHF television stations serve in the same area the differences I have just been discussing are highlighted. The commercial and competitive aspects come into play, including the difference in cost between a VHF- only and an all-channel receiver. During the formative days of the television allocation plan, parties in industry cautioned against the mixing of UHF and VHF channels in the same service area wherever this could be avoided. There are practical limits to what can be done today because of the freezing effect of an allocation plan which has been in operation for several years; yet it is not too late to provide some remedy.

Subsidiary transmitters such as boosters and translators fed from the prime transmitter are helpful in filling the signal void behind a hill or obstruction and in supplying an area for any reason not penetrated by the prime signal. Here the particular broadcasting area and terrain situation must be carefully considered and each situation must be decided upon merit.

Freedom to use a directional antenna at the transmitter might in some cases be an effective aid. It is not always possible for UHF stations to utilize the best transmitter sites with an omnidirectional antenna and provide the best possible service at the least cost. The technical problems associated with the use of a high-gain UHF directional antenna are, in some instances, simpler than for an omnidirectional antenna.

The last matter on my list in this area is receiver cost. An all-channel television receiver capable of receiving UHF stations costs more than a receiver designed to receive VHF stations only. A customer naturally will not buy the more expensive all-channel receiver unless he knows from experience that the all-channel receiver will give him an enlarged service and one which appeals to him as having value. This is a handicap for UHF that goes to the grassroots level.

WHAT CAN BE DONE TO AID UHF TELEVISION?

In my testimony up to this point I have been laying the groundwork for certain suggestions which I shall now make to this committee. In making these suggestions, I do so in the belief that I do not have, nor do I believe that anyone has, a complete answer to all of the questions which have been raised during the start-up period of UHF. It seems clear that there is no single plan or solution which will be fully effective. Rather, one must consider and act upon all of the valid proposals.

When one takes into account the differences and limitations which I have outlined and uses good engineering judgment as to environmental conditions, UHF stations can provide an adequate and satisfactory signal service. As I have already stated, it is necessary to understand television performance at UHF. It is necessary to make a correct application for each situation. There is no known alternative, for we need the UHF channels in addition to the VHF channels for our still growing black-and-white television service and for the color service which is the newest of the mass communications mediums.

I therefore include in my list of suggestions several areas in which action might be taken to aid UHF television. My suggestions are:

Authorization by the FCC of higher power for UHF stations.

Senator SCHOEPPEL. Would you care to indicate—and you may not be able to—how much higher power?

Mr. ENGSTROM. I think, sir, that one has to move between what one might like to have and what it is practical to have, both from the point of view of the apparatus itself and the use of that apparatus by a broadcaster. The Commission has proposed for consideration an increase in power from 1,000 kilowatts to 5,000 kilowatts of effective radiated power. I concur in that proposal.

I think at a later time, when economic factors are better known, the Commission might again be well advised to consider an increase even in that power to something of the order of 10,000 kilowatts or more. But I think the first step is clear, that it should go from 1,000 to 5,000 kilowatts of effective radiated power. My further suggestions are:

Authorization by the FCC of the use of directional antennas by UHF stations.

Authorization by the FCC of the use of booster and translator type stations.

Action by the FCC to deintermix on a sufficiently broad basis to create a nucleus of predominantly UHF service areas from which UHF may grow and expand.

Encourage multiple owners and others with resources and know-how to undertake the operation of UHF stations.

Repeal by Congress of the excise tax on all-channel color television receivers.

I will discuss further some of these suggestions which I have not already dealt with in my testimony.

DEINTERMIXTURE

We believe that one of the contributions which the FCC can make to UHF television is to deintermix on a sufficiently broad basis to create a number of predominantly UHF markets. Without this, the public may not purchase all-channel receivers in sufficient number to justify the continuance of their manufacture. With deintermixture on such a basis, however, UHF is provided a nucleus of areas from which it can spread to others.

Prior to the adoption by the FCC in April 1952, of its present television allocation plan, RCA recommended that the Commission—

> * * * avoid, insofar as practical, the mixing of VHF and UHF channels in the same service area. (RCA letter of March 23, 1950, to the Commission in Docket Nos. 8736 et al.)

The Commision, in dealing with proposals for mixture or nonmixture of UHF and VHF channel assignments, in its report of April 14, 1952, stated that—

> * * * UHF is not faced, as was FM, with a fully matured competing service. In many cases UHF will carry the complete burden of providing television service, while in other areas it will be essential for providing competitive service. In view of these circumstances, we are convinced that stations in the UHF band will constitute an integral part of a single, nationwide television service. (Sixth

Report on Television Allocations, 1 Pike and Fischer Radio Regulation 91:601, at 91:664.)

However, by the time the television freeze was lifted and UHF stations actually began to come on the air, VHF had a circulation lead over UHF of 21 million sets.

It is these facts which raise grave doubts as to the wisdom of intermixture, as provided in the sixth report. The Chairman of the FCC put it this way in an address on December 6, 1955:

> * * * It was assumed that the initial technical and economic handicaps of UHF would be overcome eventually, and, therefore, the Commission intermixed VHF and UHF assignments in various cities and areas.
>
> Up to the present, this basic assumption has not proved out * * *.

Some criteria, which it was suggested the Commission might want to apply with respect to deintermixture, were set forth in comments which RCA and NBC filed with the Commission on December 15, 1955. (FCC Docket No. 11532.)

MULTIPLE OWNERS SHOULD BE ENCOURAGED TO ACQUIRE UHF STATIONS

In January 1952, even before UHF channels were made available for commercial use, the National Broadcasting Co. asked the FCC to amend its rules to permit NBC and other multiple owners of television stations having the knowhow, experience, and resources to undertake part of the task of furthering the commercial development of UHF. More than a year ago the Commission so amended its rules.

Owners with experience in research, engineering, manufacturing, or broadcasting could show the way in establishing a UHF television service either in an intermixed or nonintermixed market. Persons who have a substantial stake in television and electronics should be encouraged to enter the UHF field.

REPEAL OF EXCISE TAX ON ALL-CHANNEL COLOR TELEVISION RECEIVERS

If UHF television is to succeed, it is essential that the public have greater numbers of UHF receivers. This is necessary entirely apart from anything else that is done to aid UHF.

Proposals have been made in the past that the excise tax be removed on all-channel black-and-white television receivers. This proposal was made in the interest of increasing the number of receivers capable of being tuned to the UHF channels. For example, had the excise tax been removed a year ago, there would today be a substantially larger number of receivers in use with all-channel tuners. I understand this proposal did not meet with favor because of the loss of tax revenue.

Now we are on the threshold of a new television service, television in color. We therefore have the opportunity to assure the growth of receivers with all-channel tuners as a part of this new service. The development of color television as a national service in the interest of the public and the Nation's economy requires the production of color receivers which can be priced to the consumer at the lowest possible level. This, together with considerations of price competition, make it necessary to do everything possible to bring receiver prices down.

Up to the present time, RCA color receivers have included all-channel tuners. Thus, every RCA color receiver made to date can be used for any of the UHF channels as well as the VHF channels. However, recognizing the realities of the situation and the competitive picture, as we move into higher rates of production we must plan to make VHF-only color receivers as well as all-channel color receivers. This is our current plan for the new line of color receivers which we will announce within a few months.

If the buying habits of the public for color television receivers prove to be the same as for black and white, we would then expect that something of the order of four-fifths of our production would be VHF only and the remainder would be receivers with all-channel tuners.

Congress now has the opportunity to aid in getting color television off the ground and at the same time assure an increased audience for UHF.

If the Congress exempts all-channel color sets from excise tax, we would then take appropriate steps to provide for the production of only all-channel color receivers as soon as practicable thereafter.

For us time is of the essence, because, as I have just stated, we are preparing soon to announce a new line of color receivers. These new color receivers will be moving through our factory within a month.

We believe that removal of the excise tax would be sufficient reason for all manufacturers to make all-color receivers tunable to both VHF and UHF; in other words, all-channel receivers. As color receivers replace black-and-white receivers, which they are bound to do, the UHF audience for both black-and-white and color transmissions would grow. That the UHF audience grow is basic to the success of UHF.

THE NEED FOR UHF TELEVISION CHANNELS

In conclusion, it is my opinion that the battle for UHF television is well worth fighting in the public interest. The stature of television today has been built upon the 12 VHF channels and only a partial use of the 70 UHF channels. Television needs more than 12 VHF channels in order to fulfill its promise. The UHF channels were provided to meet this need. We must work, therefore, toward solutions of the UHF growth problems which have appeared in order that television may come to fulfillment.

Mr. Chairman, that completes my statement.

Senator SCHOEPPEL. Thank you very much, Mr. Engstrom, for a most enlightening statement. I think our counsel has a series of questions that he desires to ask you.

Mr. COX. Thank you, Senator. Dr. Engstrom, I gather in 1952 when UHF stations first went on the air, it was quite clear at that time that the transmitting equipment available for them was not fully competitive with the V stations then on the air at their maximum authorized powers. Is that correct?

Mr. ENGSTROM. My answer is that it was clear to all of us who had experience. I do not remember exactly how you phrased the question. You used the word "them." In the Commission's records, in all the technical literature, it was adequately clear that more power than 1 kilowatt would be needed in order for UHF to operate on any kind of a competitive basis with VHF; yes, sir.

Mr. COX. We have been given to understand that the early U-operators believed from the position taken by the Commission—and, I gather, from certain statements of manufacturers—that that condition would be rather rapidly improved. Was there basis in the proceedings leading up to the sixth report for such a feeling of confidence on their part, in your opinion?

Mr. ENGSTROM. When you say that the situation would be rapidly improved, you mean by the construction of higher power transmitters?

Mr. Cox. Yes.

Mr. ENGSTROM. I think everyone did have the concept that that would happen, and that is what has happened. But it is also clear that higher power transmitters are not available in the first instance. They have come along since that time.

Mr. Cox. As I gather it, though, actually even a transmitter with an effective radiated power of 1,000 kilowatts has been available only for about a year and 4 or 5 months.

Mr. ENGSTROM. Yes; I believe that is correct.

Mr. Cox. I also gather that a good many UHF operators—in fact, a great majority of them—have not taken advantage of this higher power for economic or other reasons. If they were to increase from an effective radiated power of 250 kilowatts to 1,000 kilowatts, would they achieve a substantial increase in their service area coverage, or simply an improvement of the picture within their present area?

Mr. ENGSTROM. They would do both, of course. An increase in transmitter power to the maximum permitted would, within the basic service area of the station, fill in some of these low-signal areas which might be caused by hills or by buildings or by obstructions of one form or another. It would increase the distance that the signal would travel and therefore would, by the same token, increase the total service area of the station.

I think, however, one has to be careful that if in a particular environment one has a low channel VHF station in direct competition, one cannot say that they would be equivalent. The low-channel VHF station operating at maximum power of 100 kilowatts would have a larger service area and would be freer from whatever dead spots remain.

Mr. Cox. Assume that the U-station is operating at 250 kilowatts and it is considering going to 1,000 kilowatts. As it increases its service area, it again encounters a conversion problem which it may have solved in its present service area, does it not, as it now reaches out to people who have been getting television service but who have gotten it only from V stations?

Mr. ENGSTROM. I am sure you are correct, but I would assume also, in addition, that in an environment which had both VHF and UHF, even though the UHF station did not reach far enough to interest people on what might be the fringe area of the VHF station, they would have had some incentive to have purchased a receiver that would tune to all channels in anticipation of what might happen, you see, later. So except for that, I am in agreement.

Mr. Cox. Then do you not have the problem that, as the coverage is broadened, he then is getting into areas of sparse population, and there arises a very serious question as to whether the potential increase in the receivers that he can reach is going to make worth while the initial capital outlay that will be necessary to make the increase in power?

Mr. ENGSTROM. Surely. But I think that we may be going along diverging paths, you see, because I personally would not apply a UHF channel in an area which was difficult to serve because of terrain or because one wanted to get the extreme of distance. That is the job to be done by a VHF station.

Mr. COX. That was one of the points I wanted to bring up. That is, in your opinion there are now, based on experience today, certain areas in which very clearly it is almost useless to allocate UHF channels?

Mr. ENGSTROM. I can think of one—New York City.

Mr. COX. Yes; because of the problems of high buildings. And in certain other areas of rugged terrain, would you feel that it would be better, if a thoroughgoing reallocation were undertaken, to try to concentrate enough V's there to give the kind of competitive services required and to leave U's in areas of better terrain for that kind of service?

Mr. ENGSTROM. Yes, sir; I would do that. And I would try to make the U-locations, insofar as is possible or practicable, to be all U-locations. I know that one cannot do that in all cases.

Mr. COX. Could you give us, just roughly, an idea of what it would cost a U-operator to go from 250 to 1,000 kilowatts of effective radiated power?

Mr. ENGSTROM. I have some indications as to the cost of the basic equipment, but I do not have the incremental costs. I can provide this information for the committee.

Mr. COX. Would you do that?

Mr. ENGSTROM. I shall do that.

(This information was furnished by letter dated April 2, 1956, and was made a part of the record on April 23, 1956. The letter reads as follows:)

RADIO CORPORATION OF AMERICA,
New York, N. Y., April 2, 1956.

Hon. WARREN G. MAGNUSON,
Chairman, Committee on Interstate and Foreign Commerce,
United States Senate, Washington, D. C.

DEAR SENATOR MAGNUSON: During my testimony on March 15 before the Senate Interstate and Foreign Commerce Committee, I was asked to provide for the committee an estimate of how much it would cost a UHF television station operator to increase the effective radiated power of his station from 250 kilowatts to 1,000 kilowatts.

Such a conversion would involve the transmitter, the antenna, and, in some cases, the tower and transmission line. The total cost of the conversion could vary considerably depending upon the equipment the station now has.

I will assume in my answer that the equipment to be used to attain 1,000 kilowatts effective radiated power will be a 25-kilowatt transmitter and an antenna with a power gain in the order of 50. In addition, I will assume that the station is now equipped with an RCA TTU-12A (12-kilowatt) transmitter. Equipment to convert this transmitter to an RCA TTU-25B (25-kilowatt) transmitter would cost approximately $75,000. The present cost of a new RCA TFU-46AL high-gain UHF antenna would be $49,500. Additional transmitter and antenna cost, therefore, would be in the order of $124,500.

Transmitter and antenna cost for initial installation of UHF stations would be approximately $137,500 for a station with an effective radiated power of 250 kilowatts and $235,500 for a station with an effective radiated power of 1,000 kilowatts, or a difference of $98,000. This figure of $98,000 compares with the figure of $124,500, above, when a changeover to increased power is made following the initial installation.

In some cases the station might need a new tower to support the high-gain antenna and a new transmission line. The cost of a 500-foot tower, for example, would be in the order of $30,500 and new transmission line from the antenna to the transmitter, if required, would cost about $15,500.

The above figures of course do not include transportation and installation costs which vary with the particular circumstances.

Very truly yours,

E. W. ENGSTROM.

Mr. ENGSTROM. The figures which I have before me indicate that so far as the transmitter apparatus is concerned and the antenna—I am talking about apparatus cost now—it is $235,500 for a UHF transmitter having 1,000 kilowatts of effective radiated power. In comparison, a VHF high-band transmitter—this is in the upper group of VHF channels—where the Commission permits a maximum power of 316 kilowatts of effective radiated power, the cost of that equipment is $250,500.

The reason for the cost differential is basically this, that at the VHF channels it is more difficult for practical reasons to build a transmitting antenna that has high gain; whereas as one gets to the UHF channels, where the wavelength is shorter physically in inches, one may more readily build a high-gain transmitting antenna. Therefore, in order to obtain, at least by our design concepts today, 316 kilowatts at the high-band VHF, we use a transmitter, proper, which produces 50 kilowatts of power; whereas in order to obtain the 1,000 kilowatts of effective radiated power at the UHF, we use a 25-kilowatt transmitter.

Mr. COX. You indicated that the equipment costs and the operating costs for this high-band VHF station and for a UHF station are about the same?

Mr. ENGSTROM. Yes, sir.

Mr. COX. I take it that that is speaking as of today?

Mr. ENGSTROM. Yes.

Mr. COX. When most of the U-stations were built in 1952, 1953 and early 1954, were the costs, then, of constructing a UHF station more in comparison with a V-station than is true today, because you have been able to bring the costs down?

Mr. ENGSTROM. May I refer to one of my associates?

Mr. COX. Yes.

Mr. ENGSTROM. Mr. Hopkins has said that in the beginning a 1-kilowatt UHF transmitter cost approximately $25,000 more than a 1-kilowatt VHF transmitter.

Mr. COX. Were 1-kilowatt VHF transmitters being used in substantial quantities? That is, with high-gain antenna? Were they being used, so this actually would be a fair competitive comparison?

Mr. ENGSTROM. No, I do not believe it is a fair competitive comparison, because there was a rather rapid drive for the operators of VHF stations to go on increasing their power.

Mr. COX. That is, most successful VHF stations are now operating at their maximum permitted power, whereas only 3 or 4 UHF operators are using 1,000 kilowatts?

Mr. ENGSTROM. It is certainly a very much larger percentage, yes, sir.

Mr. Cox. We have heard figures—I do not believe any of them are on the record—that indicate that, to build a UHF station—this may include the studios as well—it costs $500,000 to $600,000, and that this represented, in the days when those stations were going on the air, a substantially higher cost than was required for a VHF station that could actually outcompete them as to coverage. Do you think that was likely to have been true in those earlier days?

Mr. Engstrom. I am not sure I can answer the question, as I understand it, because in the beginning all that was available to the UHF station operator was a 1-kilowatt transmitter. Therefore, he was not in a position to start out competing signal area for signal area with a VHF station.

The total cost of a broadcasting station varies widely for different operators because of the amount of studio equipment or program generating facilities which he has. If one gets down to the basic cost of the transmitter itself, then the differences are certainly very much less; and as I have indicated today, for the two powers that I have outlined, the cost is essentially the same.

It would cost a UHF operator less, in the beginning, to set up a 1-kilowatt station certainly than it would cost a VHF operator to set up a station of higher power.

Mr. Cox. Do you know whether the UHF stations now operating at 1,000 kilowatts are able to achieve, if not as wide coverage as a V competitor in that area, at least nearly enough so as to make them competitive, if their rates are right?

Mr. Engstrom. I do not believe that I am really in a position to answer that question because that is the kind of information which really should come from a broadcaster who has the experience. But in terms of the technical information which I have outlined, I think that it is a little dangerous to talk about direct competition unless one knows exactly the environment in which the stations are located.

Mr. Cox. You mentioned the development of this experimental 4,500-kilowatt transmitter at Wilkes-Barre, I believe it was. I assume these are not yet in commercial production in any sense?

Mr. Engstrom. No, sir, they are not in commercial production because it is common that, while basic development work is done in advance of permission to use such apparatus, practical apparatus designs are not finished, nor is apparatus made, until the exact requirements are known.

Mr. Cox. Do you know whether UHF operators have in general supported this proposal to increase their maximum power?

Mr. Engstrom. I personally do not know that. I understand that Mr. DeWitt, who appeared yesterday, supported the move to higher power.

Mr. Cox. Could you, looking to the future, give us any idea of what might be the cost of such a transmitter, assuming favorable action by the FCC? I am trying to get at the point whether the moving on to higher power for a UHF operator is ever going to be economically feasible in the face, at least, of their present economic situation.

Mr. Engstrom. I can give you a very crude guess——

Mr. Cox. That will be all right.

Mr. Engstrom. Since we haven't designed the apparatus and do not know its manufacturing cost. It would cost something in the order of $550,000 for that type of transmitter.

Mr. Cox. Would the cost of operation, because of the power tubes, be substantially greater for that than for a 1,000-kilowatt transmitter?

Mr. ENGSTROM. It would be just a little over two times the cost of operating a 1,000-kilowatt UHF transmitter.

Mr. Cox. Do you think that a UHF station operating at 4,500 kilowatts—assuming ideal conditions with no high buildings, at least not a great concentration of high buildings, and not too rough terrain—could achieve substantial competitive equality with a VHF station operating at its present authorized maximum?

Mr. ENGSTROM. I believe, sir, we are getting back into the area where I have difficulty. You see, when you start talking about competitive—and may I tell you why. We have these factors of propagation where there are differences, and where the difference becomes more pronounced the higher one goes in the UHF band—that is, the higher channel numbers. We have the differences with respect to a practical receiving antenna to collect as much signal. We have today's situation—and one which I indicated will improve, but only slowly—of the difference in performance on a UHF receiver as compared to a VHF receiver. All of these find a solution, at least a partial solution, which goes in the direction of increasing the amount of power.

Now, by engineering terms one can—and we have, and this information is in the technical record and in the Commission's record—put together all of these differences and add them up, and one gets a ratio of power required to be competitive, for example. But in 70 or 80 percent of all cases in all service areas that becomes fantastically high. It is in the order of thousands.

Now, let me however go back and be practical and give you a rule of thumb ratio which I think would work out if, as you say, you select an area which is reasonably favorable for UHF. If one makes a 10 times gain in the power of a UHF transmitter, one makes a noticeable improvement. If one makes a hundred times gain in transmitter power in UHF—I am saying now you have first a UHF transmitter of 1 kilowatt or whatever we use as a base—and 1 goes a hundred times, and if we then make that hundred times to be whatever is the maximum possible today—which might be 1,000 or 5,000 kilowatts—then one has the possibility of doing a very excellent job in serving an average good area.

Then the competition, you see, doesn't quite come up in the same way, because you have a good enough signal. The only thing you might not have with a UHF transmitter is the ability to go to great distances.

Mr. Cox. You discussed the operation of this experimental booster at Jackson, Miss. Was that a booster which reflected the signal on the same channel or did it involve translating it to another channel?

Mr. ENGSTROM. On the same channel.

Mr. Cox. Did you discover any difficulties with interference in the area with direct reception of the mother signal, or was that pretty well spent?

Mr. Cox. Not in that particular setup, because it was the hill which obstructed the prime signal. By putting the amplified second transmitter signal on the far side of the hill from the prime signal and making it sufficiently strong, we did not have interference between the two.

Mr. Cox. Then your general conclusion was that in some areas, at least, on-channel boosters can serve to fill in.

Mr. Engstrom. Same channel boosters; yes.

Mr. Cox. In discussing the development in reducing the noise factor in receiving sets, you indicated the UHF receivers were still not as satisfactory as the V receivers. In your opinion, is further progress along those lines likely to take place if there is any incentive to manufacturers?

Mr. Engstrom. Oh, yes; if there is incentive to do this for reasons other than television, because these same tubes, you see, are useful in communications equipment and military equipment, and the work is going forward. The point I wanted to make is that it is an area which has already received very extensive coverage, and progress is being made, but the progress is incremental in terms of the final objective.

Mr. Cox. You proposed the authorization of directional antennas?

Mr. Engstrom. Yes.

Mr. Cox. Could you tell us very briefly what advantage that would have for a UHF station?

Mr. Engstrom. Suppose we have, for an example, an area to be served which is on a seacoast; or to make my example ridiculously simple, we have an area which is built up to a certain edge and beyond that there is desert, and there is no need to serve it. One might then put a directional antenna toward the sea, but with the signal faced away from the sea so as to cover the area by that process.

This means, then, that one would concentrate the signal over the area where people live and wish to have service and not waste the signal over on the other side. There are a number of instances where that would be helpful. It is also helpful, in some conditions, to reduce the interference which this transmitter would create with respect to another on-channel transmitter at some other location behind the antenna.

Mr. Cox. So it might permit the use of this channel at less than the present minimum separations?

Mr. Engstrom. That is very dangerous to answer "Yes" to, because the present allocation plan was very carefull thought out as to station separations and there are some cases where this would be effective; but it is certainly not generally applicable because one, of course, in going to a directional antenna, in going to maximum powers, does lay down a very strong signal.

Mr. Cox. You discussed the desirability of encouraging the production of all-channel color sets through elimination of the excise tax or otherwise.

Mr. Engstrom. Yes.

Mr. Cox. I think this should be made clear for the record. My understanding would be, of course, that those sets, being compatible, would be all-channel black-and-white sets as well.

Mr. Engstrom. Yes, sir.

Mr. Cox. In other words, the color sets that RCA is now manufacturing receive all 82 channels, regardless of whether it is broadcast in color or black-and-white?

Mr. Engstrom. Yes, sir. I have only one set in my home. It is a color set, and we use it for both black-and-white and color.

Mr. Cox. You indicated that you felt that deintermixture was advisable, at least in enough areas to provide a substantial base for the continued growth of UHF. A witness who appeared before the committee earlier—Mr. Storer, of Storer Broadcasting Co.—outlined a plan which would, as I recall it, lead to the development of 25 markets which would either be all UHF or with only 1 V, and which would contain 20 million people and 4 million sets. Could you give us any opinion as to whether or not that would be such a substantial foundation as to provide continued incentive for the development of UHF receivers and transmitters?

Mr. Engstrom. I will have to limit my response to the numerical figures which you have outlined, because I am not directly familiar with Mr. Storer's presentation. I think so, yes, because what one needs is a base which is large enough to encourage the manufacturers and those who sell the receivers to put on a drive to see that more receivers are sold.

Mr. Cox. On the contrary, I assume that you would feel that if something of this sort isn't done, and if UHF stations continue to go off the air, this is likely to have a deadening effect upon the development of equipment for use on these frequencies?

Mr. Engstrom. Yes. I indicated that the trend with respect to the percentage of receivers made by industry is not encouraging, because one would have expected that if we were on the upgrade, the percentage would have gone up during 1955. Rather, the percentage went down during 1955, and the promise for this year may not be as good as for 1955.

Mr. Cox. In connection with the possible development of translators, the FCC now has a proposal for using the channels from 70 to 83. Are there any special problems in the operation of television receivers in connection with the use of those channels?

Mr. Engstrom. None that are not a part of the characteristics which I have already outlined. That is, one must have a signal strong enough to operate in the area to be served.

Mr. Cox. Is there any tendency for the oscillator tube or other elements of the set to be less effective, or to wear out more quickly, as far as reception in that part of the band is concerned?

Mr. Engstrom. Not to wear out more quickly; but again, as one goes to the higher frequencies, oscillator stability problems become more difficult, the signal and noise become less favorable, and things of that kind. But otherwise, no differences.

Mr. Cox. However, perhaps those problems would not be so serious where the translated signal would just be broadcast within a limited range?

Mr. Engstrom. And strong enough to cover the particular area; yes, sir.

Mr. Cox. Just one other point. There has been some suggestion, of course, of the possibility of getting additional spectrum space from other services in the VHF band. I think one of the members of the Commission expressed the opinion that if that were done, the cost of converting existing sets to receive these channels would be very, very slight—perhaps $1. Would you have any information which would permit you to tell the committee whether that is reasonable or whether these conversions would probably cost as much as a conversion from V to U?

Mr. ENGSTROM. I think I have to borrow from my general experience of knowledge of what people do in respect to conversions of any kind. There are probably a small percentage of receivers on the market which have strip tuners and which therefore might be changed. But the average tuner as it is now built may not readily be changed.

I think therefore we would begin with a situation which would differ from the UHF situation in that we would have 37 million sets today which could not receive the new channel. Users would convert a few, but I think that those channels would become available primarily through a change on the part of manufacturers, so that new receivers after the date of such decision would come equipped with those channels.

There is this difference. To add a channel or two in the VHF band costs something, but it does not cost as much as to add a UHF channel; but the compatibility problem remains. I do not, for one, believe that the American people will buy enough converters to change what they have to make that very significant.

Senator SCHOEPPEL. Thank you, Dr. Engstrom.

I understand Mr. Ferman is here. You have a short statement, I understand. We will hear from you now because I must alert everyone that, with the Senate in session, if there is a vote, we will have to recess or close.

You may proceed, sir.

STATEMENT OF IRVING FERMAN, DIRECTOR, WASHINGTON, D. C., OFFICE, AMERICAN CIVIL LIBERTIES UNION

Mr. FERMAN. My name is Irving Ferman. I speak in behalf of the American Civil Liberties Union as its Washington, D. C., director. The American Civil Liberties Union is a private, nonpartisan organization devoted to the promotion of the Bill of Rights. Much of our work very naturally involves the protection of the individual rights guaranteed by the first 10 amendments. However, our concern likewise extends, particularly in matters relating to free expression, to the social utility of these freedoms.

In America, we protect the individual's right to express himself for a very simple reason—because we believe in the solemnity and dignity and worth of man. This unshakable belief is part of the basic religious fabric not only of the great American community, but of Western civilization itself.

A flourishing of expression and communications in a society reflects not only the moral strength in the individual, but the moral strength of society itself.

It is not without significance that, in these critical times, freedom of expression promises to become the great weapon in democracy's arsenal of defense in its life-death struggle with Communist totalitarianism. If we have indeed reached an armaments stalemate, it is our distinctive powers of freedom upon which we must rely, and it is with these very same powers that we shall win.

The responsiveness of a free nation to truth and intelligence is its secret source of health and nurture. Our ability to maintain this responsiveness, this flexibility, may well spell the difference between victory and defeat for the free world.

And we know such responsiveness can thrive only in a field where many diverse and different ideas are able to grow and mingle, struggle, and survive.

The great sinews of American individual expression lie in our mediums of mass communications. Upon the health and vitality of our mass mediums there depend the health and vitality of our culture and our life. This is why the television mediums constitute one of the great promises of our free society, for it is the most extensive and penetrating ever devised by man. Because of this, the American Civil Liberties Union is deeply concerned with the wise formulation of licensing policies for the television as well as the radio spectrum, lest the overriding public interest be lost from sight.

The television mediums, as well as the radio, present special problems because of the technical questions concerning allocation of space on the spectrum. Contrary to the mediums which present the printed word—there is no limit to the number and variety of publications so long as paper and printing presses are available—the assignment of space on the spectrum offers real challenges to diversity of expression. The problem of ultrahigh frequency, with which this committee is now wrestling, only highlights the seriousness of the problem.

The American Civil Liberties Union in terms of its interest has noted with grave concern the competitive disadvantage of UHF channels in relation to VHF channels.

The facts of the competitive disadvantage of UHF have been ably explored by this committee under its present chairman and under Senator Potter.

The Federal Communications Commission's distribution of channels over 2 frequencies has made it economically impractical for almost 85 percent of the television spectrum to continue in existence. This has resulted in a sharp limitation of diversified program sources and an inadequate number of stations, particularly at the significant grass-roots level.

The present usable television broadcasting channels are entirely inadequate to supply a diversified, free, and competitive communications service for the entire needs of the public.

Approximately 15 percent of the total radio frequency spectrum is now allocated to public AM, FM, and TV broadcasting. But of the 82 channels allocated to TV broadcasting, the 70 UHF channels have proven to be unusable in all but a small proportion of exclusive UHF areas because of the initial licensing of the 12 VHF channels and the high costs of conversion to the public.

The great social impact of TV broadcasting may justify even radical measures of channel reallocation and expansion at the expense, if necessary, of some of the Government and private services which now occupy 85 percent of the spectrum.

The 12 usable VHF channels provide a wholly inadequate diversity of services as well as opportunity for free development of television for the public's total needs. Based on data from the A. C. Nielsen Co., it is estimated that 5 percent of the population can receive no stations; 9 percent, only 1 station; 10 percent, 2 stations; and 21, 3 stations.

The average choice of stations is only 3½. A recent Federal Communications Commission report acknowledged that 25 percent of the population had access to none, or only 1, station.

This lack of freedom of choice is also reflected in the present usage of television. Thirty percent of United States homes are still not equipped with receivers. An average of 40 percent of United States homes do not use their television sets even in the popular evening hours.

Recognition of the need for expansion has been recognized in the Federal Communications Commission. Commissioner Lee has proposed expanding the VHF band to 45 channels. Ex-Commissioner Craven has called for a minimum of 65 channels. As Commissioner Hyde recently stated:

> The basic issue is whether the United States, with its growing economy and its expanding need for communication service, and particularly for television service, is going to have a system with low ceilings built in or whether or not it is going to have a system with sufficient number of channels to give opportunity for development of a comprehensive, competitive free enterprise system.

Proponents of pay television emphasize that if adequate channels were available and exclusively licensed for pay use to avoid displacement of free broadcasting, the broadcast communications mediums could have the same opportunity to develop diversified smaller audiences as the paid print mediums. While the union has not taken any position on the problem of subscription TV, an expansion of TV channels could certainly meet one of the major objections of subscription TV opponents, that it will cut into existing free TV service.

The public interest dictates that underlying the policy of licensing and allocating channels there be an attempt to insure the greatest number of economically secure outlets, so that we can achieve and maintain within the framework of the mediums the widest diversity of views, of expression, indeed, even of cultures.

All of these factors point clearly to one direction—that before the Senate considers the specific proposals suggested to relieve the TV problem, a basic congressional study of the inadequacy of present service and the present and future public needs for broadcasting services be made. In such a study, the Congress should be guided by authorities from all institutions which conduct or are served by the communications mediums. Independent representation from journalism, publishing, education, social and political science would be vital. Needless to say, the proposed study should not concern itself with the content of programs, for program review could lead to undesired Government interference with opinion, but solely with the issue of multiplicity of channels.

We further urge that the present study by the Federal Communications Commission of its allocating policies be pursued to a conclusion as quickly as possible so that present licensing will be conducted more in line with the public interest.

What should be emphasized, however, is that the leaders of American television industry thus far have displayed a high degree of social responsibility, so that the mediums in its short life has contributed much to American thought, suggesting an even greater promise.

Senator SCHOEPPEL. Thank you, Mr. Ferman.

Mr. COX. Thank you very much, Mr. Ferman.

Senator SCHOEPPEL. Mr. Biemiller.

STATEMENT OF ANDREW J. BIEMILLER, LEGISLATIVE REPRESENTATIVE, AMERICAN FEDERATION OF LABOR AND CONGRESS OF INDUSTRIAL ORGANIZATIONS

Mr. BIEMILLER. Senator, with your permission, I will summarize the first three pages if you will consider them as read for the record, and then will concentrate on the last couple of pages.

Senator SCHOEPPEL. That will be helpful indeed. You may proceed in your own way, sir.

Mr. BIEMILLER. Mr. Chairman, my name is Andrew J. Biemiller. I am a legislative representative for the American Federation of Labor and Congress of Industrial Organizations, with offices at 901 Massachusetts NW., Washington, D. C.

We welcome the opportunity to appear here today and place in the record certain views of the labor movement on some of the questions within the scope of this hearing. I further understand that when this committee reaches the item of pay-as-you-see television, we will be given additional time to set forth our views on that question.

First, I wish to place in the record a letter sent on December 15, 1955, to the Chairman and the members of the Federal Communications Commission by President Meany of the AFL-CIO. That letter read:

The AFL-CIO, an organization of 15 million Americans, joins with the Federal Communications Commission in its concern over the present state of the development of television. Pursuant to your general invitation of November 10, 1955, I welcome this opportunity of submitting preliminary comments concerning this important problem.

The American public has made television possible. It has purchased over 37 million TV sets. It spends its valuable leisure time at these sets. Organized labor has a great stake in the sound development of our TV system which your notice of proposed rulemaking indicates you intend to reconsider on an overall basis.

The phenomenal growth of TV and its widespread acceptance has outstripped all expectation. At stake here is whether the American people are to eventually have a nationwide system of 2,000 TV stations, or to be cut down to a system of scarcity of stations with time available only to the largest corporations in industry.

The basic premise on which we all agree is that TV spectrum space is in the public domain. It is therefore the Commission's obligation to plan and allocate enough channels in such a manner as to avoid hampering future growth. This proceeding, in my judgment, should be geared to having as many channels as possible, for as many TV stations as possible, in as many communities as possible.

In 1952, the Commission's allocation plan recognized this need and allocated 82 TV channels for the development of a nationwide competitive system. It is a source of deep disappointment to me to read in your notice that this system is not being developed.

I agree with the three objectives summarized in your notice as constituting the basic philosophy of establishing such a system. You stated these objectives as follows:

(*a*) At least one service to all areas;

(*b*) At least one station in the largest possible number of communities;

(*c*) Multiple services in as many communities as possible to provide program choice, and to facilitate competition.

To accomplish this goal, I believe the Commission should preserve and encourage as full use as possible of the 82 channels provided for in the 1952 decision.

In addition to the use of these 82 TV channels for commercial purposes, the future of educational TV also is at stake. You know, of course, the role of organized labor in the development of the American public-school system. Labor has for many years also been vitally concerned with educational radio and TV. It has vigorously supported the educational TV reservation made by your Commission, by appearing in those hearings.

Any proposed cutback in the number of TV channels will threaten these reserved channels and endanger the future of a nationwide educational TV system. Needless to say, with the critical condition in which American education finds itself today, any curtailment in the educational reservation would be a disastrous blow to the American people.

The merger convention of the AFL-CIO adopted a resolution on education which contains a section on educational TV. That section reads:

We believe that educational TV has proved its value where stations have been established and we insist the Federal Communications Commission continue to reserve the channels set aside exclusively for educational purposes.

All TV educational stations should have an operating committee fully representative of all interests in the community.

Mr. Chairman, our membership is vitally interested in protecting the channels reserved for educational TV. When this question was before the FCC in 1950, President Meany, then secretary-treasurer of the AFL, made a statement before the Commission. He said in part:

It has frequently been said that in spite of the many avenues of communication that have been developed in the modern world, we continue to be poorly informed on many vital problems. We believe the best way to guard against this is to give every possible assurance that the avenues of communication are made available to all groups in society. It is important for members of labor organizations to obtain information regarding the problems, conditions of work and viewpoint of farmers, businessmen, housewives, and governmental and professional leaders. It is no less important that members of such groups should have the opportunity to learn of the experiences, problems and conditions of work and aspirations of the 16 million members of organized labor.

The interests of labor and the interests of the broader community are for the most part identical. It is essential in these days and in the days ahead that our common interests should be emphasized and the basis of our differences be understood.

Radio and television have made some contribution to establishing a common basis of understanding. The history of the last 25 years, however, has shown that radio has not played the great role educationally that was expected of it. Television offers even broader areas of appeal and possibilities of utilization in developing educational programs. Indeed, there is the real possibility that radio and television may be used to supplement each other for educational purposes. It is that hope that impels us to urge that the maximum possible provision for the use of television in education be made by your Commission.

In the event your Commission approves this request, we urge (1) that sponsorship of such facilities be encouraged on the widest possible basis. We favor the sponsorship of such stations by broadly representative committees, or under the joint auspices of several educational institutions. In metropolitan areas, there are usually a number of colleges, universities and nonprofit institutions which carry active educational programs.

(2) The quality and scope of the educational station should be improved and constantly widened. The experience in the development of programs should be made available to other stations.

(3) We urge that your Commission require stations licensed for educational purposes to give reasonably adequate reports of the nature and purpose of the programs offered. Such public reports would assist your Commission in appraising the work of the stations and would result in an exchange of techniques, ideas and material among stations and, above all, it would bring the station closer to the community it serves.

That statement is as valid today as it was in 1950. We trust that this committee will take all necessary steps to protect the present reservations for educational channels. The data we have submitted in this statement, Senator, points out that we hope there will not have to be a curtailment of the UHF side of the spectrum. We are concerned that there has been talk of cutting back the number of stations that will be available to the American people. We are anxious to see the original program of two-thousand-odd stations maintained, and we trust that the FCC and your committee between you are going to find the proper solutions that make certain a competitive system is maintained and that the greatest possible service is made available to the American people.

We also are very anxious that the reservations that have been made in both VHF and UHF for educational channels should be continued. Our convention went out of its way—the merger convention of the AFL-CIO—insisting that educational TV has already proven its worth; that we think it has a great potential for the future; and we trust that those channels will be maintained as educational channels.

We believe that there is in these stations a potential that is badly needed for strengthening our educational system in America. I am sure no one has to argue that we have grave deficiencies at the present time in education in America, and we think this is one way of taking care of some of the difficulties which do confront us.

I would, sir, like to call your attention to our statement starting at the bottom of page 3.

We also desire to direct the attention of the committee to the Biscayne Television Corp. case. This case involves the grant of channel 7 in Miami, Fla., to this corporation.

The executive council of the American Federation of Labor protested the examiner's decision favoring this grant in letters to the chairman and members of the FCC on March 4, 1955. The action of the executive council was taken at the request of the Dade County, Fla., Central Labor Union.

We objected on the grounds that (1) 85 percent of the stock of the Biscayne Television Corp. is equally owned by the owner and key personnel of the Miami Daily News and the owner and key personnel of the Miami Herald; (2) the Miami Herald and the Miami Daily News own and control two large radio stations in the area; (3) the ownership of the newspapers and the radio stations are both absentee as none of the major stockholders reside in Miami; and (4) both newspapers have had antilabor news and editorial policy.

However, the Commission made the grant in January 1956. The grant has been appealed and the matter is now before the courts.

The labor movement has been concerned for some time over the tendency in the newspaper and radio field toward combination of large interests which would result in this most important phase of American life, dissemination of news, being in complete control of a few individuals in any given area.

It is our considered opinion that ownership of three kinds of mass media—newspapers, radio, and television—by the same group of people in any area is against the public interest. The key personnel of the 2 newspapers in the Miami area own between them 85 percent of the new television corporation, which will also have title to the most powerful radio station. This is an obvious concentration of control of all types of media in the hands of a very few people.

As an indication of community of interest between these Miami papers, we find that when the typographical employees of the Miami

Herald went on strike some 7 years ago, the management of the Daily News immediately locked out its typographical employees. Now we find the key personnel of these papers joined together in control of an important television channel. The vast population of this area will for all practical purposes have to rely on a very few individuals for the dissemination of news by all media.

Organized labor has always been in the forefront of the fight for freedom of the press. It is our belief that nothing could be more detrimental to the maintenance of freedom of the press than to have control of the media for news dissemination go into the hands of a monopoly. If monopolistic control of news media should become widespread throughout the country, it is inevitable there will be an eventual public demand for Government control of news dissemination media, if not for Government ownership. This is an eventuality we should not like to see occur.

We respectfully request that this committee carefully investigate all aspects of the circumstances surrounding the granting of the license to the Biscayne Corp. and the probable effects of this decision on the growth of monopoly trends in the news media field. We also urge that the committee request the FCC to stay a construction permit to the Biscayne Corp. until the committee has an opportunity to consider the monopoly implication of this grant and the courts have had an opportunity to rule on the issues under appeal. It is all too plain from past experiences that once a station is constructed, it is almost impossible to obtain reversal of a grant by any procedure.

That, sir, concludes our testimony.

Senator SCHOEPPEL. Thank you, Mr. Biemiller. The counsel desires to ask some questions.

Mr. COX. With regard to this last matter that you have discussed, Mr. Biemiller, did you seek formally to intervene in the FCC procedure?

Mr. BIEMILLER. Yes; we did so seek and were turned down on the grounds that the rules would not permit a third party intervenor, in effect.

Mr. COX. Then you are not involved in the current court test?

Mr. BIEMILLER. We are not in the current court test. Our membership, which is roughly 50,000 in the Miami area—Dade County Central Labor Union—has repeatedly, however, insisted that it believes the public interest is not being served. It is in that guise that we are still trying to find someway of getting a thorough examination of what we consider to be a dangerous monopolistic trend in this area.

Mr. COX. Are you by any chance familiar with the testimony that was given before this committee earlier in this series of hearings on the question of the antitrust laws by members of the Commission and by Judge Barnes from the Antitrust Division of Justice?

Mr. BIEMILLER. No, sir; I am not.

Mr. COX. They presented to the committee certain views as to their respective roles in enforcing the antitrust laws in the communications field. I was leading up to a question as to whether or not any sort of approach had been made to the Department of Justice itself on the ground that you had reason to believe that this was leading to an undesirable monopoly in the mediums of expression in this particular area?

Mr. BIEMILLER. To the best of my knowledge, no. We have approached the Antimonopoly Committee of the Senate Judiciary Committee, but to the best of my knowledge there has been no direct approach made to the Department of Justice.

Mr. Cox. In the nature of things, of course, with this matter now before the court of appeals, would it be fair to say that substantially what you are asking the committee and Congress to do is to give consideration to this problem, at least in general, so that if legislation for the future seemed desirable, it might be taken? In other words, legislatively, it would be a little difficult to do something about a fait accompli in a particular area. You are looking to the general problem of concentration in the medium of mass communications?

Mr. BIEMILLER. Yes, plus, however, Mr. Cox, the fact that in the opinion of some of our people who have looked at this case, they are not so sure but what the Commission hasn't in effect changed its own rules. That, I recognize, is probably a court matter. But it is something this committee might want to take a look at and see whether there has been a substantial change in the earlier rules of procedure of the Commission itself.

Senator SCHOEPPEL. Thank you very much, Mr. Biemiller. I regret the delay this morning, but it was absolutely unavoidable.

The hearings will be recessed until Friday, at 10 o'clock in this room.

(Thereupon, at 12:17 p. m., the subcommittee recessed, to reconvene Friday morning, 10 a. m., March 16, 1956, in room P-38, Capitol Building.)

TELEVISION INQUIRY

(UHF-VHF Allocation Problem)

FRIDAY, MARCH 16, 1956

United States Senate,
Committee on Interstate and Foreign Commerce,
Washington, D. C.

The committee met, pursuant to adjournment, at 10:20 a. m., in room P–38, United States Capitol, Senator John O. Pastore presiding.

Present: Senators Pastore and Thurmond.

Senator Pastore. Our first witness this morning is Mr. H. Leslie Hoffman. Mr. Hoffman, we want to thank you for coming. You may proceed to deal with your statement in any fashion you may desire.

STATEMENT OF H. LESLIE HOFFMAN, PRESIDENT OF RADIO-ELECTRONICS-TELEVISION MANUFACTURERS ASSOCIATION

Mr. Hoffman. Mr. Senator, my name is H. Leslie Hoffman. I am president of the Radio-Electronics-Television Manufacturers Association, which has its headquarters in Washington, and I am also president of the Hoffman Electronics Corp., a manufacturer of television receivers and other electronic products, located in Los Angeles, Calif.

This particular company is a company founded 15 years ago and it has grown from a small company of 3 people to 3,800 people. I am also chairman of the board of KOVR, a broadcasting station allocated to Stockton, Calif., and serving northern California.

However, my testimony as president of RETMA covers the manufacturing end of our business. If there are any questions regarding broadcasting, I would like to carry on that testimony as an individual, not as a representative of the industry.

Since 1924 RETMA has been the only national trade association representing the manufacturers of equipment and components now used in radio, television, and electronic devices. Its membership presently consists of 374 companies, many of which are engaged in the manufacture of television sets or their components.

We appreciate this opportunity to appear before the Senate Interstate and Foreign Commerce Committee and to explain the position of the equipment manufacturers in this highly important problem involving UHF and VHF television.

My statement will be based on the following facts:

(1) The ratio of UHF or all-channel television receivers to total TV set production is determined by public demand and is closely related to the ratio of UHF to VHF broadcasting services.

(2) The cost of all-channel TV sets is higher than that of VHF-only sets, because of certain more expensive components and a smaller production volume.

(3) The only practical means of equalizing the sales prices of all-channel receivers and VHF sets is to remove the 10-percent excise tax on UHF-VHF receivers.

(4) Manufacturers of television receivers, like other industrial producers, are in business to make a profit and dividends for their stockholders.

We manufacturers have a deep and obvious interest in the development and growth of television into a nationwide service, and, through our industry association, we have had an important part in bringing this about.

Two of our major all-industry contributions, effected through two national television system committees, were the development of transmission standards, first for black-and-white television and subsequently for color television. These standards, which were made possible by the cooperation of manufacturers and broadcasters, were subsequently made possible by the cooperation of manufacturers and broadcasters, were subsequently approved by the Federal Communications Commission and provided the technical basis for the compatible television system in operation today throughout the United States.

It has been estimated that the engineers under NTSC guidance voluntarily contributed 10 million man-hours toward the development of the color television standards alone. In addition, manufacturers willingly pooled the results of their research, without concern for patent rights, in order to bring color television as quickly as possible to the American public.

RETMA sponsored the first industry demonstration of UHF receiving equipment for members and the staff of the Federal Communications Commission in Bridgeport, Conn., in June 1951. The purpose of this demonstration was to convince the FCC and UHF broadcasters that reliable and satisfactory UHF reception was possible. Included in the demonstration were several types of UHF converters which subsequently were put on the market.

Set manufacturers have consistenly made and sold as many all-channel receivers as the public would buy. They actually overestimated the market for these sets and the public interest in UHF during the first year or so following the lifting of the freeze.

I can testify to that myself, because we had an excess inventory.

When the purchase of these receivers did not measure up to the manufacturer's expectations and inventories got out of balance, manufacturers naturally reduced their production accordingly.

Senator PASTORE. Wasn't that more or less cause and effect? The fact of the matter was that UHF had not panned out economically—

Mr. HOFFMAN. It didn't get started, Senator, as far as we thought it would.

Senator PASTORE. Principally because of representations made by the members of the Commission themselves. I do not want you to comment on that, but I wanted to make that observation.

Mr. HOFFMAN. I won't comment on it.
Shall I go on?
Senator PASTORE. Yes.

UHF PRODUCTION RECORD

Mr. HOFFMAN. The industry's record of UHF production and conversion, particularly during the first 2 years, is rather remarkable for a new product. I think these figures are rather significant in that respect. Manufacturers through February 24, 1956, had produced 4,500,000 all-channel receivers, or approximately 15.8 percent of the 28,236,000 television receivers manufactured since the debut of UHF.

In addition, approximately 4 million television receivers, both new and old, have been converted outside the factory, either in the home or by distributors or dealers. Thus the total number of television receivers equipped for UHF reception since the first commercial UHF station was licensed in the summer of 1952 is 8,500,000. This represents approximately 22 percent of the total television receivers in use.

Senator PASTORE. Will you stop there just a moment? I will need just 2 minutes to get myself on the quorum and I will be right back.

(A short recess was taken.)

Mr. HOFFMAN. While no accurate figures are available on the number of households within the actual range of UHF stations, the RETMA statistical department has estimated that the maximum is 21 percent, and the actual number of homes able to receive a good UHF signal is probably substantially less.

People cannot be expected to buy UHF sets, however, unless there are UHF programs they want to see. When UHF stations go off the air, sales are adversely affected.

It is significant that 108 VHF television stations now on the air were approved by the FCC before UHF entered the picture. Since that time 264 VHF stations and 156 UHF stations have gone on the air. However, 58 UHF stations have discontinued operations as against 8 VHF stations.

It certainly must be obvious to members of this committee that television manufacturers have every reason to want as many TV stations in operation throughout the country as the economy will support. The more stations that are on the air, the more programs there are available, and the greater incentive there is for the purchase of a television receiver. While some set manufacturers—including myself—are also engaged in television broadcasting, the manufacturing operations of these companies are separate from broadcasting activities and are all stimulated by the same natural desire to sell as many television receivers as possible.

It never ceases to amaze me when I hear or read comments—sometimes by responsible Members of Congress—which state or imply that some manufacturers or the industry as a whole is engaged in a conspiracy to keep a new product, such as UHF, off the market.

Senator PASTORE. I don't think anybody in the Congress ever said that.

Mr. HOFFMAN. Yes, sir, they have, unfortunately.

Senator PASTORE. They have?

Mr. HOFFMAN. Yes, sir.

Senator PASTORE. That is news to me. Go ahead.

Mr. HOFFMAN. To anyone like myself who has encountered the intense competition and the aggressive salesmanship that is found in the radio-television industry, such a charge is absurd. I doubt that there is an industry in the United States today that is more competitive than ours. Each manufacturer is constantly striving to improve his product, to offer some additional sales appeal, and to undersell his competitors.

Unfortunately, I think we spend too much time on the last point.

Consequently when the Federal Communications Commission lifted the freeze and began licensing UHF television stations in the summer of 1952, manufacturers already had started producing all-channel receivers. Most of us envisioned a new stimulant to the television boom, particularly in the opening of new UHF markets. Many manufacturers felt that there would be a sharp trend away from VHF-only sets and toward all-channel receivers. In fact, there were predictions at the time that the VHF-only set would gradually disappear.

RETMA statistics, which are accepted as reliable by both industry and the Government, show that in the last quarter of 1953 the factory sales of UHF–VHF receivers, in proportion to all TV-set production, was 28 percent. However, by the second quarter of 1955 these sales had declined to about 13 percent.

RETMA statistics on UHF production and sales did not get underway until the third quarter of 1953. Attached are tabulations which trace the rise and decline of UHF in (1) factory sales, and (2) factory inventories, while the third table shows the relation between UHF-set inventories and sales.

(These tabulations will be found beginning on p. 724.)

Mr. HOFFMAN. It is apparent from these statistics that manufacturers generally have maintained a more than adequate supply of UHF sets. For example, in January 1956, 16.4 percent of the total TV sets on hand were equipped for UHF reception. However, only 13.4 percent of total TV sales were UHF. These figures would indicate that manufacturers provide a greater supply of UHF sets than consumers demand.

I am going to ask Mr. Long, who heads up our statistical department, to explain this chart, Senator, if I may, which graphically portrays that.

Mr. LONG. This chart, sir, will illustrate Mr. Hoffman's remarks. There is a two-bar chart [indicating] for each quarter running from 1953 to 1955. The gray bar here is inventories; the blue one is sales. Both of these are presented as a percent of the total. For example here, the first quarter of 1953, UHF inventories were something less than 20 percent of all inventories. For this quarter, UHF sales were slightly more than the inventories.

You can observe here that, generally, manufacturers have maintained a more than adequate supply. Inventories have been greater than sales in terms of total percentages.

We had an overinventory situation of great magnitude in the first quarter of 1954, and that was corrected—overcorrected to some extent. With the exception of the fourth quarter of 1954, manufacturers have maintained more inventories than the public has demanded.

Mr. HOFFMAN. I might explain, Senator, that these figures include the inventories at the manufacturing level, at the distributor level, and at the retail level. So it is total pipeline inventories, rather than just one segment of the pipelines.

UHF SET COSTS MORE

The manufacture and sale of all-channel television receivers, like UHF broadcasting itself, is almost entirely a commercial or economic problem. The all-channel receiver costs more to manufacture than the VHF set for two reasons: The first is that it requires some more expensive components, and the second is that the higher unit cost is aggravated by the smaller volume of production. However, no increase in volume would eliminate the differential in cost.

The set manufacturer would have been happy when UHF began, and would be equally happy today, if he could convert all TV set production to the all-channel receiver. Such a conversion would reduce production operations and lower manufacturing costs. This saving would be passed on to the consumer in reduced retail prices. However, under our present pattern of TV broadcasting, such a practice would impose an additional and unnecessary cost on set purchasers in VHF-only areas, which, going back to our figures, would amount to 79 percent of the population.

From the beginning of UHF broadcasting, UHF converters were readily available at reasonable prices. Moreover, some types of VHF sets could be easily converted to UHF reception in the home at a moderate cost. Where UHF stations were successful in affiliating with one of the major networks, such conversions were made in substantial numbers. However, in other areas where independent UHF stations were attempting to compete with network VHF outlets, the rate of conversion was very small.

Our industry has had long and frustrating experiences with converters. When FM radio was in its heyday, many FM converters were on the market, but the lack of public interest eventually led to their disappearance. Very nearly the same thing has occurred with UHF converters. In addition to the public apathy toward conversion, the average housewife seems to have an aversion to disfiguring her television or radio receiver with any sort of gadget such as an exterior converter.

I would like to refer to our second chart here on this matter of conversions which I think is rather interesting.

Mr. LONG. This chart shows the situation monthly from July 1953, through January of 1956. The blue area represents the number of sets sold which were factory equipped for UHF. The gray area represents the number of sets that were converted for UHF reception. Of course the total of the two would represent the total consumer acquisitions of sets able to receive the UHF signal.

What I would like to call to your attention is that, generally, factory sales of UHF-equipped sets have remained fairly constant. It is this conversion that has shown a marked decrease. Here [indicating] the consumer conversions of VHF sets to UHF were quite substantial. We find that currently it is almost insignificant.

Senator PASTORE. Would you go a step further on that? Would the blue represent the markets that were originally UHF exclusively, and the gray, the VHF markets where a U came in and the viewers wanted to adapt themselves to that new channel?

Mr. LONG. No sir; I don't believe you can draw that conclusion. We could say that the gray are VHF sets that consumers had attached a strip or converter to, and converted them to UHF reception.

Senator PASTORE. But I am asking the question: Why do you think so?

Mr. HOFFMAN. I would like to take that question on, perhaps, Senator.

Senator PASTORE. All right.

Mr. HOFFMAN. I think what happened, in the early days when we had the 108 stations, is that many stations were in what we call fringe areas and had VHF sets, and they had these big, tall 100-foot towers and so forth. Then when a UHF station was put in their market, they already had the receiver and their antenna up, and so forth, so they merely adapted it to get the UHF channel in that particular market. I think that occurred in many places.

Senator PASTORE. Let me ask you this other question, man to man: Has the industry any interest in preserving the UHF system of broadcasting in any way?

Mr. HOFFMAN. We have an intense interest to preserve it.

Senator PASTORE. Why?

Mr. HOFFMAN. No. 1, we are vitally interested in establishing the objective of the frequency allocations system, and that is a fully competitive nationwide service.

Senator PASTORE. Why do you say then, that you will only manufacture those units the public will buy?

Mr. HOFFMAN. Because our business is an economic business.

Senator PASTORE. Then you have no particular interest in preserving the UHF as a broadcasting system. You are only interested in making the sets that the public will buy?

Mr. HOFFMAN. Well, I think our businesses are commercial enterprises, Senator.

Senator PASTORE. I am not being critical of you. I just want to find out if you have any interest in the preservation of this UHF system other than making only those sets that the public itself is willing to buy, which is something beyond you.

Mr. HOFFMAN. Senator, let me answer your question this way: I think, No. 1, I have tried to prove through my previous remarks—and we have some other facts here that we will put before you—that the industry, and the individual manufacturers collectively, have done a great deal as far as trying to preserve UHF in the development of the proper equipment to get a good signal, both in the broadcasting and the receiving end of it.

Our end of it happens to be the receiving end of it. We think that we have made very material technical contributions.

Senator PASTORE. I think you are entitled to know, Mr. Hoffman, why I am asking you this question. I am not trying to put you on the spot in any way, because, after all, I am one of those who has been around long enough to know that industry, of course, is going to manufacture these sets only as long as they can sell them. They are going to manufacture the sets that the public is willing to buy. I think that a lot of us are running off with the idea that they are going to begin to manufacture these all-channel sets, come what may, just for the love of preserving the UHF band—and I don't think that is in the minds of the manufacturers at all.

Mr. HOFFMAN. We wouldn't be able to keep the love of our stockholders, Senator. [Laughter.]

Senator PASTORE. That is right. We ought to face the realities of life. I think too many people in this whole problem are kidding themselves about what is going to happen. I think you have developed the idea here that about the only thing that will equalize this disparity in cost is this thing of the excise tax.

Mr. HOFFMAN. Yes, sir; you are absolutely right.

Senator PASTORE. If, economically, you are going to absorb the difference in the rate that you might get from a tax consideration, you might consider it. Doesn't it boil down to that?

Mr. HOFFMAN. To answer your question directly, I can give you a definite "Yes"; that we would build all-wave if the tax was taken off of all-wave sets.

Senator PASTORE. In other words, if UHF is going to be saved, the Commission better save it itself, because the industry isn't going to save it.

Mr. HOFFMAN. The Commission does not have the right, nor the power, to remove the excise tax on all these sets.

Senator PASTORE. I am not saying that. I am just saying that they could develop a competitive system of integration—I don't mean "integration," but intermixture and deintermixture.

Mr. HOFFMAN. I am glad to see that a Senator gets mixed up in these Washington words as well as myself.

Mr. COX. Would it be fair to say, Mr. Hoffman, that you would feel that the set manufacturers have an interest in UHF in that if UHF could be made a viable part of the television system, it would develop a broader base for broadcasting and there would be more sets sold, so that to that extent you have such interest?

Mr. HOFFMAN. Yes, you are absolutely correct, Mr. Cox.

Senator PASTORE. But before you get to answering that question, the basis for that is going to come from a public demand and not from the manufacturer.

Mr. HOFFMAN. That's correct.

Senator PASTORE. Let's face it.

Mr. HOFFMAN. We are the suppliers of equipment that the public uses. I think that—if I may use my own words—this may perhaps be pertinent to your question. A television set is a set to receive a show. That is all it is. We sell the set to get the show. If the people are interested in the show, they will buy the set. If they are not interested in the show, they won't buy the set. We are in that business.

Senator PASTORE. You can only sell the set if they are willing to buy it.

Mr. HOFFMAN. That's right.

Mr. COX. And if there is no UHF signal in the area, there is no show for which they would have any incentive to buy the set?

Mr. HOFFMAN. There is no reason for them to buy that particular set.

Senator PASTORE. But if the demand is strictly VHF, the manufacturers are not going to go to the trouble of developing and spending time on research for UHF or all-channel sets and for improving them, if there isn't going to be a demand in the market for the purchase of these sets.

Mr. HOFFMAN. As we pointed out here, Senator, we have done a great deal of work and original pioneering and developing of equipment to utilize the spectrum that the Commission has allocated for this—this additional spectrum for these UHF channels. I know in our own particular instance and our own companies, we went ahead as many other companies did and ordered strips for a lot of channels we thought were going on the air, but that did not go on the air, and we have taken a pretty sizable writeoff for 3 years on those particular strips.

Senator PASTORE. Would you venture an opinion on this: A lot of people are saying around here that the answer to this problem would be all-channel sets. As a matter of fact, all-channel sets may be an answer to the problem. Would you venture an opinion on this question: Insofar as the manufacturers are concerned, they are not going to get into manufacturing all-channel sets unless, from the standpoint of economics, it is profitable for them to do so?

Mr. HOFFMAN. That is correct.

Senator PASTORE. And for that reason, it is only a question of profits.

Mr. HOFFMAN. It is a matter of responsibility to our stockholders.

Senator PASTORE. I can understand that.

Mr. HOFFMAN. Shall I go on?

Senator PASTORE. Yes, please.

UHF AND COLOR SETS

Mr. HOFFMAN. A question has been raised in this committee as to whether set manufacturers are now producing, or planning to produce, all color TV receivers with UHF reception facilities. At the request of your staff, RETMA has polled all of the set manufacturers in its membership and has come up with the following data based on an estimated 95 percent of color TV production in 1956: 66.5 percent of the color television receivers manufactured in January and February of this year were factory equipped to receive UHF signals.

However, the same companies which reported production during this period stated, in answer to a question, that only 10.6 percent of the color sets they plan to produce during the remainder of 1956 will be equipped to receive UHF telecasts.

The following comments, taken from responses to the RETMA questionnaires, explain why these manufacturers are planning to reduce drastically their ratios of all-channel color TV sets:

> For the remainder of 1956 we will incorporate UHF tuners in 5 to 10 percent of our UHF (color) sets unless the excise tax is removed from all-channel color sets. In that case we will go 100 percent UHF–VHF.
>
> Our percent of color sets containing UHF is primarily determined by the substantial inventory we now have of unsold UHF monochrome TV sets. There has been a very disappointing sales volume of monochrome in UHF markets.
>
> If there is appropriate excise tax legislation to remove the present price differential due to cost as between all-channel and VHF-only receivers, we would expect that our entire color receiver production during 1956 would be all-channel receiver sets. Failing this legislation, competitive reasons will require that our production of all-channel color sets be about 20 percent of our total output and VHF-only color sets about 80 percent of our output.

THE EXCISE-TAX PROPOSAL

There is no single or quick solution to the television-allocation problem. Any solution is likely to involve a number of measures and to take considerable time. Many measures that are under consideration are highly controversial. There is one proposal, however, which has met with widespread approval. It is the proposal to encourage UHF broadcasting by removing the 10 percent manufacturers' excise tax from all-channel sets and thereby put it on a par pricewise with VHF.

This proposal was made by RETMA on May 19, 1954, before the hearings being held at that time by a subcommittee of this committee. It was endorsed immediately by then Chairman Hyde on behalf of the Federal Communications Commission. Since that time the proposal has been supported by many spokesmen in industry and Government. The subcommittee, we understand, requested the Senate Finance Committee, following the RETMA testimony of May 1954, to remove the excise tax from all-channel sets. Senator Johnson introduced a proposed amendment on the subject to be made part of the Internal Revenue Code of 1954. The Senate Interstate and Foreign Commerce Committee approved it. The Senate Finance Committee concurred in principle, but, on the advice of the Treasury, altered the tax proposal to a less desirable \$7 credit on each all-channel receiver. The legislation, however, died in the adjournment rush. In January of 1955, Representative Ikard revived the original tax-removal proposal in H. R. 4070, but it was rejected by the House Ways and Means Committee. That sort of gives you the background of this particular situation.

No one contends that the removal of the excise tax would be a panacea for all the ills of UHF. Everyone must admit, however, that it would go a long way toward stopping the deadly downward drift of UHF which our statistics have just shown. It is unfortunate that Congress did not adopt our recommendation 2 years ago. If it had done so, it is our supposition that virtually the entire manufacture of television receiving sets would have been shifted promptly to all-channel sets. In round numbers that would have meant the entire 2 years' production, of 15½ million sets, would have been capable of receiving UHF. Instead, only 2½ million all-channel sets have been sold during the period. The impetus that an additional 13 million UHF sets in the hands of the public would give to UHF broadcasting today is incalculable. (RETMA Statistical Department figures show factory production of 15,401,220 TV sets during period March 1, 1954, to February 24, 1956, of which 2,512,807 were VHF–UHF.)

While it is unfortunate that these 2 years have been lost, it is still not too late, and we renew our recommendation as the only realistic method of inducing customers to buy all-channel receivers.

The manufacturers' excise tax should never have been imposed on television sets in the first place. The Treasury recommendations for imposition of the tax were rejected by Congress on three separate occasions, and were adopted only at the outbreak of the Korean war, and then as an emergency revenue measure. Television is an instrument of public education and enlightenment, and is an important means of the mass education so crucial to the preservation of American freedom and self-government in these times. There is every reason that the distribution of sets should be encouraged by our Government—not penalized. There is no logic to selecting such an instrument for the imposition of a selective and discriminatory excise tax.

It is time for the Government to stop discriminating against the television industry. I doubt that the members of the committee are fully aware of the extent of this discrimination. The history of our Government's recent tax policy has been replete with it:

(1) Two years ago Congress reduced from 10 percent to 5 percent the tax on virtually all products of the American home that were subject to tax except television sets and radios. Now refrigerators and other appliances pay a 5 percent tax, while television sets and phonographs pay 60 percent of the excise tax on durable home products subject to tax, although they represent only 44 percent of factory sales of such products.

(2) Great damage is being done today by the imposition of the 10-percent tax to the infant product—color television. This is being done despite the fact that Congress has traditionally withheld the heavy hand of excise taxation from new products until they had a chance to reach mass production. No reason has been given to explain why color television should not have the same chance as other infant products. At least color television should have the same breathing spell that was given the other products of our own industry—radios, phonographs, records, and black-and-white television. That means taking the tax off color sets now.

I would like to comment off of this particular prepared script just for a moment on that—and that is this comment: I think this idea of taxing new products by the Government is most unfortunate for the economy at large, because our industry has grown from a $400 million industry prewar to a $2 billion industry today—75 percent of the employment in our industry is on products that 10 years ago we didn't even know about.

In addition to that, this employment has been a great stimulant to the economy as well. Everybody—the financial advisers, the boys that are going through school—everybody that is looking to the future knows there is a great future in electronics. Why burden this new industry with discriminatory taxes?

There is another factor on this, and I can speak with a certain amount of feeling on this particular phase of it, and that is that in a new industry—as a new industry gets started—it gives birth to new companies. It gives opportunity to smaller companies. A smaller company can move faster than a large company, particularly in the early days of a new industry. As a matter of fact, that is how I got started in this business. I was able to move faster than some of the large people in the industry, and I got my start, and I have held on. But this industry is a great stimulant to the economy, and to put discriminatory taxes on these various things is like taking a yearling colt and saddling him with a handicap of 132 pounds. It is just all wrong.

(3) Only last Tuesday, March 13, the Forand subcommittee of the House Ways and Means Committee invited the attention of the full committee to the possibility of cutting the tax on cabarets in half. The subcommittee also announced that it had decided to recommend raising additional revenue from our industry by imposing the full 10-percent tax on transistors, record players, and wire and tape recorders. The conclusion to be drawn from these announcements is

that our industry may be asked to pay more discriminatory excise taxes in order to provide relief for nightclubs.

The point I am trying to make is this: Since the public will be benefited by removal of the tax from all-channel sets, it is very appropriate that such relief be enacted because this industry is bearing more than its fair share of excise taxes.

However, let me make one thing crystal clear: The manufacturers are not asking for removal of the tax from all-channel sets in order to benefit the manufacturing industry. We have proposed to Congress that the tax be removed from color sets and that the rate on black-and-white be reduced to 5 percent to eliminate the discrimination against our industry as compared to other home products. It is only because of the Government's need for revenue that we have not gone all the way at this time and asked for entire elimination of the tax, which is our fundamental position.

In the case of UHF, however, the question is whether it is important to the public to have a system of television that will assure room for future growth, community self-expression, educational television, and a fully competitive system. If Congress removes the tax from all-channel sets, it will be because these goals are important to the public. We believe they are important and that is the reason we urge removal of the tax from all-channel sets.

Before leaving the tax subject, I would like to comment on the remark made by one broadcasting representative before this committee on February 27. It was that the tax on VHF-only sets should be raised to 15 percent and the tax on all-channel sets reduced to 5 percent as a means of helping UHF. I doubt that this was put forward as a serious proposal, but for the record I must say that RETMA is strenuously opposed to it.

First, since it is wrong in principle to levy a selective excise tax on television sets, it is wrong to increase the rate of tax on any television set.

Secondly, if the purpose of the suggestion was to offset the revenue loss expected from the reduction of the tax on all-channel sets, it would not achieve that objective because the sale of VHF sets would decline sharply under such a heavy penalty tax.

Third, the public interest would not be served by a law which, in effect, penalized the manufacture of VHF sets in comparison with other household appliances. There may be areas in which VHF-only sets should be continued. The problem is how to encourage UHF, not to destroy VHF. If we want to encourage the use of rye bread, we should not go to length of putting poison in the white bread.

ALLOCATION PROBLEMS

RETMA filed a statement with the Federal Communications Commission last fall saying that in our opinion no one has proved that the TV allocation plan now existing under the Commission's sixth report and order is inadequate or defective. We repeat that view now. We think that a system of combined VHF–UHF broadcasting should be preserved. Twelve channels are not enough for a nationwide competitive system, and we doubt that sufficient additional VHF channels could be obtained from other services to assure a healthy system on an all-VHF basis. We strongly urge that the portions of the UHF spectrum presently allocated to television be preserved for television. It is only in this way that the Nation can provide for the future growth of television, for essential local self-expression, and for educational television.

We do not say that the present plan is perfect. The 3 years of experience since its issuance should reveal many improvements that could be made. We urge that all reasonable and useful methods be employed, and all adjustments to the plan made, which would help achieve a healthy combined VHF-UHF television system. The tax relief measure should be enacted by Congress immediately. The FCC should explore all promising measures and take action as soon as possible.

We believe that the hearings being held by this committee are contributing much to the solution of this difficult problem and we hope very much that the committee will call upon RETMA if we can furnish any further information that might be helpful to the committee in its deliberations.

(The appendixes to Mr. Hoffman's statement, containing the tabulations referred to in his testimony, are as follows:)

UHF set statistics

A. FACTORY SALES

Period	UHF TV set sales	Total TV set sales	UHF as percent of total
3d quarter 1953	360, 381	1, 862, 849	19. 3
4th quarter 1953	491, 602	1, 747, 101	28. 1
1st quarter 1954	379, 192	1, 610, 320	23. 5
2d quarter 1954	263, 705	1, 151, 612	22. 9
3d quarter 1954	349, 724	1, 997, 875	17. 5
4th quarter 1954	478, 859	2, 644, 771	18. 1
1st quarter 1955	316, 153	2, 140, 977	14. 8
2d quarter 1955	151, 142	1, 175, 766	12. 9

4th quarter 1954	14. 6	18. 1			

Mr. Cox. Mr. Hoffman, as I understand it you feel that the elimination of the excise tax on all-channel sets would substantially serve to induce manufacturers to manufacture all-channel sets exclusively. Is that so?

Mr. Hoffman. Yes, sir.

Mr. Cox. However, if you were to take the excise tax off all television sets, that would still leave an incentive to the manufacturers, under the forces of competition, to manufacture VHF-only sets to the extent that the market demanded it.

Mr. Hoffman. I think that your pattern, Mr. Cox, would be pretty much what it is today. It would be established by demand.

Mr. Cox. In other words, if this excise-tax relief is to have any effect on the UHF-only problem, it should be done by taking, initially at least, the step of eliminating only the tox on all-channel sets.

Mr. Hoffman. Yes, sir, that is correct.

Mr. Cox. I think you pointed out that RETMA demonstrated to the FCC, and to people potentially interested in UHF broadcasting in the early days, that UHF could be an effective broadcast vehicle. Do you think that people who were going on the air on UHF in those days were induced to believe that it was going to be somewhat more effective competitively than it turned out to be?

Mr. Hoffman. I think, Mr. Cox, that I might speak as a manufacturer, if I may, on that score——

Mr. Cox. Yes.

Mr. Hoffman. I think that if you follow the history of television itstlf, you get perhaps the answer to your question. Television, from 1946 on through 1950, was an unprofitable pioneering job. I know personally that very few of the broadcasters in thoses particular periods up until 1950 made any money.

Then in 1950 the picture abruptly changed. The black figures started coming in across the board. So by 1952, when the freeze was lifted, many people felt that just getting a channel allocation was like hitting an oil well. I think that there was too much enthusiasm on everybody's part, and not enough analysis of the real problem of broadcasting.

I think that the manufacturers looked at this thing primarily, "Well, here is a big new market." You see, at that particular time with 108 stations, I believe, in 62 markets—if I am not mistaken—our market was limited. We are an aggressive industry. We are trying to serve the public, and we saw this big new market coming up. We have 36 members of our association that build sets, whereas we only have 6 members that build broadcasting equipment. So our enthusiasm was to serve this new market that came up. I don't think that the set-manufacturing division did much to encourage people to get into UHF broadcasting, other than a general idea that here was a big market to serve.

I think that the encouragement of people to get into this was predicated on a track record—not that I want to sound as if I follow the horses, but some of these terms come in pretty handy—the track record of television broadcasting up to that time. The previous 2 years had been very favorable. So they thought it would be a profitable venture. So everybody surged into it.

Mr. Cox. Wasn't there, in addition to the fact that it seemed that television broadcasting was becoming profitable, also explicit in the sixth report the indication that this new UHF group of frequencies that were being made available were very shortly going to be fully competitive, so that an intermixed system of allocations would provide the people who were taking UHF allocations with a facility that could survive in the market?

Mr. HOFFMAN. I think, Mr. Cox, my comment on that would be that I think that the people—and I don't know exactly what you are driving at—but I think that the people in Washington, and specifically the Commission, were thinking in overall enthusiasm and not in a particular market. This varied by particular markets.

Mr. Cox. Let's get down to the specific situation. You suggested at the conclusion of your statement that you think that basically the sixth report and its allocation plan is sound?

Mr. HOFFMAN. We do.

Mr. Cox. And that the intermixing, or at least the joint use of both VHF and UHF channels, continues to be desirable? Can you suggest to the committee how the present intermixed allocations can be made to work if, in all of the major markets at least, there are VHF stations on the air which people can receive without the extra expense of buying an all-channel set, and if the networks—also impelled by economic considerations just like the manufacturers—have by and large chosen the VHF cutlets for affiliation? Even if there are 3 or 4 UHF channels in such a market, how can anyone be induced to take them up and to go on the air and try to make it pay in the face of the experience to date?

Mr. HOFFMAN. I am speaking now from RETMA's viewpoint. We appointed a frequency allocation systems committee to study this particular thing—to get at the very problem that you are posing. It was felt that this problem is both technical and economic, and that our activities should primarily be directed at the technical phase of it rather than the economic phase of it.

From a technical phase, we ran into the dilemma that deintermixture and many of the other things that had been recommended were controversial within the association itself. We felt, also, that a good many propositions had been forwarded in desperation rather than based on sound engineering principles.

We offered RETMA's services at that time to evaluate any of these proposals, from a technical viewpoint, to see whether or not they would be useful—that is, to assist the Commission in the engineering phase of this problem. That offer still holds.

Mr. Cox. You would agree, wouldn't you, that at the present time, even with the development in UHF transmitters and receivers that has taken place since 1952, still the likelihood of an additional UHF station surviving, if it were foolhardy enough to go on the air in a V market, is very slight?

Mr. HOFFMAN. I wouldn't want to say that as a general statement, Mr. Cox. I think you make a mistake here in trying to get a general statement. It is a desirable thing, but not a very pertinent thing at times. That is very pertinent in a market like Los Angeles that has seven VHF channels. A UHF channel in that market surely would have a hard time getting going. There are 2½ million sets already out in the area.

However, in some of the markets that have not been served since 1946 or 1947, and some of the markets where there may be 1 or 2 stations and there is enough of a market to support a 3-station market, then I think the UHF station would have a very good chance of survival.

Mr. Cox. How about Pittsburgh, Pa., where, as I recall it, there is one V on the air and one U. There is another V allocated, but not yet granted, and the U station, we are informed, is having a difficult time and is in fact broadcasting only part time?

Mr. HOFFMAN. Frankly I am not familiar with that situation. I don't know the peculiar problems involved in that specific instance. But I think the problem of any broadcasting station is the problem of programing and advertising. If they have an economic problem it is probably involved in that. I think the problem in Pittsburgh, I am sure, is an economic problem rather than a technical problem.

Mr. Cox. Doesn't it perhaps start with technical difficulties in terms of coverage?

Mr. HOFFMAN. You see, what happened is that this whole problem has been sort of a cumulative problem. The freeze itself contributed to this problem. After all, we had 3 years of a freeze where we froze these 108 stations in 62 markets. Of course during that particular time, people were establishing their habits of viewing. A new station, whether it was VHF or UHF, that came on after that time had to change the habits of viewing of that particular part of the population. So the freeze itself that was imposed by FCC operated against UHF.

Then we come along and we finally put these channels on the air to develop greater coverage and a competitive system, and we suggested that we take the tax off of all-wave receivers so we could get distribution fast, and that was denied. So I think we have made constructive suggestions all the way along here to help this UHF problem, but there hasn't been very much attention paid to them. I think—to go back to your question—a new station going on the air is like a new business going into a community. If it is a grocery store and there are three grocery stores in that particular community and the other grocery stores have got the people going to them and they are doing a good job of servicing, and they have got all the groceries the people want and the prices are competitive, it is hard for the new grocery store to get started, whether it has got a red front or a white front.

Mr. Cox. I would like, if I may, to ask you now a few questions about the other phase of your activities as a broadcaster. You are the owner of a station that is allocated to Stockton; isn't that correct?

Mr. HOFFMAN. Yes, that was an idiosyncrasy of the frequency allocation.

Mr. Cox. It could serve there better than somewhere else?

Mr. HOFFMAN. Our transmitter is actually located on Mount Diablo which is 20 miles from San Francisco, and actually 30 miles from Stockton. However, it was located there because it serves a greater area of the population than would be true if it were to be located nearer Stockton, without any reduction of the service to Stockton there.

Mr. Cox. There are 3 VHF stations on the air in San Francisco and 1 U, is that correct?

Mr. HOFFMAN. Yes, sir, that is correct.

Mr. Cox. Are there any other stations on the air in Stockton?

Mr. HOFFMAN. There was one U and it went off the air.

Mr. Cox. Your station is a VHF station?

Mr. HOFFMAN. Yes, sir.

Mr. Cox. It is the only V allocated to Stockton?

Mr. HOFFMAN. Yes, sir. However, there are two VHF stations in Sacramento, which is close by Stockton, and they also serve Stockton.

Mr. Cox. Do the signals of the San Francisco stations serve Stockton?

Mr. HOFFMAN. Yes, sir.

Mr. Cox. Do you have an affiliation with a network?

Mr. HOFFMAN. No, sir.

Mr. Cox. The three V stations in San Francisco are each affiliated with a network?

Mr. HOFFMAN. There is 1 company-owned station and 2 affiliates, yes, sir.

Mr. Cox. Do you know whether or not there are network programs made available to those stations which are not used by the stations?

Mr. HOFFMAN. I believe there are.

Mr. Cox. Have you ever tried to get the right——

Mr. HOFFMAN. We have asked for the right to take those programs. We have also asked for the right for second runs of the shows that the networks have, and both of them have been denied.

Mr. Cox. Both have been denied?

Mr. HOFFMAN. Yes, sir.

Mr. Cox. Do you find that, operating as an independent, you have a problem in obtaining desirable programing because of public preference for network programing?

Mr. HOFFMAN. I think that the problem is not necessarily whether it is network programing or not. It is quality of programing, and of course appeal to public interest. Of course I can talk as an independent station which has put a substantial amount of money in developing a station. It is sort of a cycle. A basic problem of any business is to take in more than you put out. To take in more than you put out, you have got to get advertising dollars. That is the basic fundamental concept of our broadcasting—it is supported by advertisers, the same as our newspapers are.

For the advertisers to support your station, you have to have an audience, and to get an audience, you have to have programs. The amount of the audience is determined by ratings. Many people think that the ratings are inaccurate, but nevertheless that is the yardstick. If you don't get the ratings, you don't get the advertisers' dollars, so you don't take in more than you put out.

So the problem becomes a very serious problem as far as programing is concerned. Of course, also, at the present time there is a variation from 6 to 13 hours a day of network programing being offered the affiliates. So an independent station has got to develop the programing to offset that, both in quality and quantity.

Mr. Cox. Do you find that an independent station even has difficulty getting the right to show the product of independent film producers because of the fact that they are interested in selling this particular film series in as many markets as possible, and they may find, therefore, that the network is the best potential customer for that?

Mr. HOFFMAN. I think that that again is an economic problem as far as the film producer is concerned. He has got so much money tied up in his films, and he has to get X number of dollars out. If he can go to a network and sell that film, it is a much easier sale, and it is a lower cost sale and probably he gets more out of it.

If he has to go out and pick off the independent stations, or get into a time spot of a network affiliate that is not now being occupied by the network, and do it on a patchwork basis, it is more difficult. So as a consequence, the network indirectly affects the independent station as far as the independent film producer is concerned.

Mr. Cox. Because it in effect competes with the independent station for the purchase——

Mr. HOFFMAN. That is right; again it is the economic problem.

Mr. Cox. Have the networks, in declining to permit you to use either programs that have not been used by their local affiliates or to permit you to run them at a later date, given any explanation for this? Or has it just been a bare refusal?

Mr. HOFFMAN. No; it has been a bare refusal.

Mr. Cox. Isn't it true that the Federal Communications Commission, a year or so ago, changed its chain broadcasting regulations as far as the rights to first refusal are concerned, to limit them to refusal as far as another station operating in the same community was concerned, whereas previously they had applied to stations in the same area?

Mr. HOFFMAN. I think that is true. We haven't pressed the point. I must go on record this way: I think I was a little more knowledgeable when I went into this business than some of the people who went in the UHF business. At least I knew some of the problems I was going to face. However, it turned out in some cases to have cost me more money than I figured they would cost originally.

Mr. Cox. Thank you, Mr. Hoffman.

Senator THURMOND (presiding). Mr. Hoffman, I want to thank you for your contribution to the committee.

Mr. HOFFMAN. Thank you, Senator.

Senator THURMOND. Our next witness is Mr. Clifford F. Rothery. Is he here?

Come around, Mr. Rothery. Proceed with your statement.

STATEMENT OF CLIFFORD F. ROTHERY, INTERNATIONAL PRESIDENT, NATIONAL ASSOCIATION OF BROADCAST EMPLOYEES AND TECHNICIANS, AFL-CIO-CCL

Mr. ROTHERY. My name is Clifford F. Rothery, of San Francisco, Calif. I appear before your committee in my capacity as international president of the National Association of Broadcast Employees and Technicians, AFL-CIO-CCL, commonly referred to as NABET. We are the largest trade union operating exclusively in the radio and television field. We hold collective bargaining agreements with two of the three major American networks and with independent radio and TV stations from coast to coast covering radio and TV engineers, technicians, and other operating personnel. We have a very keen interest in these proceedings and their outcome.

First let me say this: While I represent a labor organization, I do not come here as a proponent of any special labor interest, but rather on behalf of an organization that feels deeply the responsibility that all of us have who are directly engaged in radio and TV activities. Our first responsibility is to the public, whether we function in the industry as labor or management, or, I submit, as an arm of Government, since the Federal Communications Act binds the FCC to serve the public interest no less than it does the station licensee or its personnel.

I think the principal question today is just how is the public interest being served by the present policies of the FCC? To what extent is the FCC itself being governed by the standard which is supposed to govern the granting of licenses, namely, the "public interest, convenience, or necessity"? I think these are pertinent questions on the record.

We in NABET—the men and women who bring radio and TV to the public—have viewed with growing dismay the many FCC deviations from the public interest standard set up under the Federal Communications Act. We have ourselves felt the effect of policies which we are convinced are the result of a fundamental confusion as to the end purpose of the Federal Communications Act so far as it bears on the use of the airwaves.

I think the FCC has lost sight of its basic responsibility to promote a free and competitive national system of radio and television devoted to high standards of service and meeting the local community needs of the people. For how else are we to explain the steady trend to monopoly in radio and television, the deterioration of the content of radio and television broadcasting, and the near collapse of UHF?

What explanation is there for the widespread speculation in radio and TV properties which has made this industry such a lush field of operation for quick-profit takers, if it is not that the FCC has misinterpreted its function? And how else are we to explain the fact that in the United States today there aren't more than 20 educational TV stations on the air leaving the Nation to the mercies of the national advertisers to determine what, if any, forms of entertainment the 35 million owners of television sets shall enjoy?

And how, for example, does FCC discharge its duty to the public when in the vital area of civilian radio and national defense it permits an industry guided principally by money considerations to determine, for all practical purposes, whether or not civilian radio shall be employed at all? I am referring, of course, to FCC policies respecting the use of Conelrad, about which I shall have more to say at a later point.

I think, gentlemen, that the principal reason for the sorry state in which television finds itself today is the fact that the public interest has been tossed overboard and the private desires of individual businessmen have been made paramount. They have literally been given a field day.

Consider the effect of FCC policies concerning the assignment of radio or TV station licenses by the original licensees. There are presently few restrictions on the sale and resale of the station license or franchise, which, to begin with, is granted without charge by the Government to the holder on the understanding that the public interest, convenience, and necessity will be served. As a result, there is a very active traffic in FCC licenses after the original grants, and it is a common experience for stations to sell at several times the original investment in station physical assets. The profits are, of course, attributable to the value of the FCC license. The "business goodwill" thus capitalized is entirely due to the privilege granted the licensee to do business on the airwaves—a free grant. And this capitalization of the FCC license by private businessmen is ordinarily accomplished very shortly after the original license is granted—but, of course, not less than 6 months after, to avoid the impact of the normal income-tax rates and have the advantage, instead, of the lesser capital-gains tax.

Thus any day you can pick up the trade papers and see new notices of station transfers approved by the FCC, at prices substantially in excess of original investment, and usually after a holding period that would be uncommonly short in other fields of business enterprise, but which has come to characterize the radio and TV business. For example, in my own home city, San Francisco, TV station KPIX, a Westinghouse operation, was reputedly purchased for $7½ million from the original licensee, who had about a million and a half invested, and who had held the license for hardly more than 4 years. The FCC approved this sale.

Within the past several weeks the trade papers report the sales of WIRI–TV in Plattsburgh, N. Y., for $500,000 plus; WRDW and WRDW–TV in Augusta, Ga., to South Eastern Newspapers for $1 million plus; WGTH–TV in Hartford, Conn., for $650,000, and so on and so forth. These transfers are garden-variety transactions. I haven't run down the figures to determine what profits have been taken on these sales, but I know sales like these ordinarily represent substantial profits to the original licensees, and that FCC policies encourage the traffic.

It is a significant fact, I think, that in the past 5 years at least 100 TV stations have changed hands, having been sold once or more than once, with FCC approval. This represents 20 to 25 percent of the total number of TV stations now operating, a surprising rate of station ownership turnover—but not surprising when you consider the remarkable profits to be made in the sale and purchase of TV stations, particularly under present conditions of near-monopoly of the airwaves by a limited number of VHF channel licensees. Plainly the FCC's present policy respecting UHF, which discourages active competition with VHF, assures high capital gains to the fortunate holders of VHF licenses who decide to sell out fast, or high returns to those who decide to stay in.

Let me cite to you what the industry thinks in this regard, quoting from a broker in the business who spoke before the California Radio-TV Broadcasters Association recently. He said:

> Pick any investment stock on today's market that will compare even remotely with radio station or television station return and you've found a bonanza. The only investment sources outside radio and television where you may get a higher return are in oil, minerals, or lumber, where the speculation is infinitely greater.

He then goes on to compare the advantages of operating radio-TV properties at 25 to 30 percent return on capital with the advantages of selling them to take the capital gain at lower tax rates.

It is elementary economics that a high demand for a necessary commodity in limited supply bids up the price and conduces to monopoly. This in a nutshell is the present situation in television, and it is directly due to FCC policies, which place no curb on the process of purchase and sale of station licenses and pyramiding capital investments.

But the effects on the future of television are serious. One effect, plainly, is to price out of the market the local enterpriser with limited means, the community-minded citizen who wishes to operate a community-based station. Where he might have the means to build and operate a station starting with the original license, he cannot afford to buy from a licensee in competition with the big money available from large group interests operating from outside. Multiple ownerships and newspaper ownerships are encouraged by the FCC, which allows a single company or individual to own up to seven TV stations. Consequently, the number of independent owners has steadily contracted, pushing out local interests in favor of the big-moneyed groups. And this process toward concentration is continuing, and at the expense of hometown television which, I submit, is one of the objects of Federal policy under the Communications Act.

Another necessary effect of this FCC policy allowing wide-open trafficking in television licenses is the lowering of licensee qualifications. At the time of the original grant the FCC presumably selects the best suited among the competing applicants for the license, and the size of an applicant's pocketbook is not the principal consideration—but plainly it becomes so when the license is sold by the first holder, for then price becomes the criterion, and the market place and not the FCC ultimately decides who is to hold the license.

A third effect of this process of quick and profitable sales of television licenses is to siphon off future earnings in the form of present capital gains. The seller realizes an immediate windfall, and is taxed at capital gains rates only. The purchaser, on the other hand, starts out with a considerable initial investment, on which he expects to earn a return. To do so, he may have to increase his advertising rates, which ultimately reflect in higher prices to the consumer, or cut his operating costs, which will reflect in heavier burdens on his employees, as members of my union can testify. Or he may lower the quality of his service. In other words, FCC policy here encourages tax avoidance with loss in tax revenues, a more costly or inferior product to the public, and reduced employment or underpaid employees in the industry.

Another effect is the increased control, though indirect, of the airways by national advertisers. This follows, first, from the fact of multiple ownership, and second, from the ability of big advertisers to pay the kind of rates which keep high-cost stations operating. As a result, community control is diminished, local advertising is subordinated, and the direct service product—namely, the communication and entertainment presumably to be furnished—becomes debased by the station owner's total dependence on the big commercial sponsor.

And just in case anyone has any illusions about the devotion of big advertisers to culture and high-level entertainment, permit me to quote, without naming, the director of a big New York advertising agency. The advertising director was speaking of color, and is quoted in the trade press as follows:

> Color TV will be the biggest advertising medium ever. The worst program looks good in color. For promotion and public relations, color is the best thing that has happened * * *.

Now I ask you! But that's the way they think, and this is not just an augury of how bad our programs will be with color, but an indication of how bad they already are with black and white.

UHF is clearly affected by this FCC policy which allows station costs to be pyramided by the sale and resale of station licenses. And perhaps this FCC policy is one of the keys to the whole sad UHF situation. Obviously there is every incentive on the part of VHF holders to limit competition, particularly since this assures that the market value of their properties will be enhanced several times over. Here are rich pickings, gentlemen, so why let UHF interfere?

And while I am on the subject of UHF, permit me to point out that what the profit-seeking industry is doing looks very much like what was done to FM in radio. The radio industry killed FM. And the operators in television will, if allowed, kill UHF in the same way. And the public will again be the loser.

You remember FM—frequency modulation? It promised high-fidelity broadcasting and a new world of enjoyment to the public. AM license-holders rushed, and got, the FM licenses; for a short while they offered separate programing, and then shifted over to complete duplication on FM of the AM programs. The result was that FM went by the boards, since from the standpoint of the public there was no sense to buying FM sets when they could get the same programs on their AM sets. Today, the great bulk of some 500 FM licenses outstanding are held by AM licensees—and very few are in actual service. Instead, FM licensees are in many cases using their high-quality FM signals to feed programs from their AM studios to their transmitters, thus cutting out the cost of suitable transmission lines. This final abasement and destruction of FM must be laid squarely on the doorstep of the FCC, which failed to save FM from the profit seekers in the industry.

We are rapidly approaching a like situation with UHF. The present ill-conceived pattern is due at least to FCC's lack of foresight, if not to an excessive tenderness for monopoly-minded operators in VHF. It is clear that television's future lies in the UHF portion of the spectrum, and it is equally clear that congressional action may be necessary to get FCC to apply policies, such as deintermixture, to save UHF. Ultimately UHF must prevail throughout, in order to bring more television stations into the communities, and the right policies will encourage the conversion of sets to receive UHF.

Educational TV is fated to remain an unrealized dream unless action is taken to implement the full intent of national policy under the Federal Communications Act. It is a striking fact, I think, that although 258 TV channel assignments have been reserved for noncommercial educational use, barely a handful of stations have been able to take to the air, and this although the private sector of the television industry has been able to generate over half a billion dollars of revenue during this past year, together with radio having become the wealthiest advertising medium in the country. Over a billion dollars a year are now being spent to reach and sell the radio and TV audience. But very little of this goes for high-quality programing. A high proportion of radio-TV time is straight commercials, and too high a proportion is taken up with second-rate motion-picture films. In fact, television is a principal consumer of old pictures, and the sale of pre-1948 films for TV use is estimated to amount to $50 million this year. Yet, as one motion picture magnate has admitted, the public wouldn't pay at the box office to see the very pictures which are unloaded on it in the TV living rooms of the Nation.

All of which points up the deficiency in high-level programing, the failure of the industry, and the duty of the FCC to find alternatives through effective promotion of educational TV. Either the industry must be made to pay for educational TV, or Government must directly subsidize it, to bring to the public the rich possibilities of television. And, certainly, the FCC should emphatically reject any suggestion from private industry that educational channels not yet taken up be made available for commercial use.

Of course, educational TV and the promotion of local television go together, and it appears to be the policy of FCC to favor the reverse. The dilution of hometown control is manifested also in the case of the daytime broadcasters, who for years have sought to stabilize their broadcasting day on a basis that would accommodate local needs instead of varying with the sun. The plea of the daytime broadcasters would assure stability of operations, certainly something to be desired in any industry which is to be genuinely competitive. But their pleas have fallen on deaf ears. The FCC continues to ignore the local need for local services, with the result that more distant stations of sufficient power and wealth continue to be favored, once again pointing up the submergence of local expression by absentee television ownership.

The sensitivity of the FCC to the industry's financial calculations can have dangerous consequences, and I suggest that this committee might well inquire into how far the industry may be served at the risk of national defense. I have here specific reference to the question of CONELRAD, which is a radio communication system devised to be used in time of enemy attack and which depends on the cooperation of private radio-station owners. This calls for manually operated transmitters, since manual adjustments must be made to change the station's frequency as required for CONELRAD. The necessary adjustments cannot be made in radio stations which are telemetered, that is to say, which operate their transmitters by remote control.

Consequently, when a radio station is given authority to operate by telemetering, it just drops out of CONELRAD. The more stations that are allowed to telemeter, the less effective CONELRAD becomes, since the whole point of CONELRAD is to confuse enemy aircraft attempting to home in on some station's signal. A multiplicity of signal points through CONELRAD would render this difficult, if not impossible.

Telemetering, also known as remote control or automation, is a cheaper form of operation than manual operation of transmitters. Hence, the industry would like to have it. This was originally permitted for small stations (10 kilowatts, nondirectional), with the result that a large number of small stations dropped out of CONELRAD. Now the larger stations hope to get FCC authority to do the same. If they get it, the result will be the practical scrapping of CONELRAD, and once again the profit motive will have been placed above public need.

Unfortunately the FCC's whole tendency is to allow precisely what this profit-oriented industry wants. It has now authorized test telemetering of a 50-kilowatt directional radio station under the financial sponsorship of NARTB, the industry's trade association. The purpose of the test is to determine the engineering feasibility of remote control of transmitters in large stations, about which there is, anyway, little question; the real question is what will happen to CONEL-

RAD when and if FCC submits to industry pressure for universal telemetering.

NARTB has already proposed that FCC amend its rules to allow telemetering in 50-kilowatt directional stations, recalling—and I quote from the industry's magazine Broadcasting-Telecasting for February 20—that—

the Commission stated the most important consideration was whether the revision in question would result in any degradation of the Commission's technical standards.

Perhaps this is the technical consideration which, also, it so happens, squares with the industry's financial considerations—but what of the consideration of nationl defense? Hasn't the licensee assumed some obligation to the general public and the Government when he was granted an FCC license, and isn't he under a duty to carry out this obligation? Or is he to be permitted to take a "calculated risk" with the Nation's safety by demanning his transmitter? It is, regrettably, not too hard to understand a station licensee taking such a "calculated risk," but it is indeed hard to understand that the FCC should allow him to do so.

Of course, it must be acknowledged that Government can pay for CONELRAD participation, which, in fact, it is doing today in some cases. But it is then pertinent to inquire why Government should subsidize this rich industry's participation in national defense, when its very riches are the direct result of a Government grant of the privilege to do business on the air waves.

Finally, I would like to ask this committee to consider how far the FCC carries out the public purposes of the Federal Communications Act in still another area in which it has, it would seem, recently undertaken to function. I have in mind the recent involvement of the FCC in labor controversies, which I had hitherto supposed to be exclusively within the province of other agencies of Government and subject to other laws. My union has, on occasion, been compelled to take strike action against radio or television station operators in pursuit of lawful collective-bargaining objectives. Not long ago, in two such strike situations, the FCC responded to claims of "sabotage" leveled against NABET members by the strike-bound employers. In one of these situations the charges were ultimately dismissed, but in another an FCC examiner, by some peculiar reading of the Communications Act, succeeded in equating a lawful work stoppage with "willful damage of radio apparatus" under the act.

It is not my intention, of course, to appeal the FCC examiner's decision before your committee, but I do consider that this committee should be concerned when the FCC enters the labor-management relations field, since under the law it is confined to regulation of communications. Or does regulation of communications carry with it the right to regulate labor-management relations? If the FCC can justify this on the ground of its right to license radio operators, it will be the only regulatory agency which, by such an expedient, injects itself into labor disputes, and a matter of great interest to other labor organizations functioning in industries where technical personnel are licensed.

But of course what is really important about FCC's intervention in labor-management disputes is the further evidence it offers of the Commission's undue sensitivity to the requirements of the businessmen in the industry, regardless of effect on other areas of public interest, whether it be national defense or public policy respecting labor-management relations. And I submit that perhaps Congress needs to redefine, in sharp terms, the purposes of the Communications Act and the function of the FCC to protect the public interest in monopoly-free radio-television and in the quality product, regardless of the profit seekers who presently seek to concentrate control of the airwaves in their own hands.

Thank you for the opportunity to express these views before your committee. If there is any way in which NABET can be of assistance in your further inquiries, we shall be only too happy to cooperate.

Senator THURMOND. Would you please answer a few questions?

Mr. ROTHERY. Certainly.

Mr. COX. Mr. Rothery, in this matter of the assignment of station licenses, do I understand that it is your position that the FCC has approved the transfer of licenses from the original licensee without applying the same standards and safeguards that are applied in the initial comparative hearing where they are selected mong several applicants?

Mr. ROTHERY. I think so. It would be difficult to apply the same standards to a competitive group as to one person.

Mr. COX. In other words, where a licensee seeks approval of a transfer, he comes in with a proposed transaction which has been concluded satisfactorily between himself and the prospective purchaser and simply asks the FCC to approve this, without at that time in any way opening up for general consideration the question of whether someone else would be better qualified to provide service.

Mr. ROTHERY. That question never enters.

Mr. COX. Would this be possible: As I understand it, in a comparative hearing the FCC looks to the question of whether the applicant has local residents in its organization, to the question of integration of ownership and management, to the civic record of the people connected with the applicant, and decides, on the basis of the evidence, which of these applicants is best qualified. Having gotten the license, can that license then be transferred to someone who meets none of those standards, if the FCC simply finds that, at a minimum, the proposed transferee is technically and financially qualified?

Mr. ROTHERY. Technically and financially, some minimum requirements as to citizenship—the very minimum of requirements.

Mr. COX. Have there been, to your knowledge, any significant number of cases in which such proposed transfers have been refused by the FCC?

Mr. ROTHERY. Very few have been refused.

Mr. COX. Do I gather from what you say that a good many of these sales have been made to multiple owners who are gradually accumulating television holdings in various parts of the country?

Mr. ROTHERY. Yes, because of the price involved, mainly.

Mr. COX. That is, they are the people most likely to be able to come up with the largest offer? Does your organization have any concrete proposal to make as to what should be done about this? That is, is it your view that it requires legislation, or that it simply requires a tightening up of FCC practices?

Mr. ROTHERY. I think the FCC practices under its rules could do so. However, they may be overruled by the courts. Many things enter the mind—high taxes, a transfer tax upon such sales, possibly the use of such money to support educational TV, which is a need.

In many ways—there have been regulatory agencies in States, for instance, that have set limits upon the price of certain licenses, such as the license of a bar or saloon, where there is trafficking in such licenses because of their limited number. In southern California they have stopped it by setting a top price that can be obtained for a license.

Mr. Cox. I think at one point you quoted a business broker who discussed, I think you said, a rate of return of something like 25 to 30 percent on capital in television operations. That wouldn't be general, would it—a rate that high?

Mr. Rothery. It wouldn't be difficult to say that it was general. Dropping out the UHF stations, there are various instances where I would say it would be low on a capital investment.

Mr. Cox. Exclusive of the UHF stations?

Mr. Rothery. Exclusive of the UHF stations.

Mr. Cox. Only at VHF?

Mr. Rothery. Only VHF.

Mr. Cox. Do I gather from what you say, that you feel that, under the impact of present policies of advertisers, perhaps educational television is the only real possibility that remains for a quality type of programing on television?

Mr. Rothery. No, I don't say a quality type. I say the main purpose of television as an educational, informational medium is better served when it is not controlled by advertisers.

Mr. Cox. Wouldn't you agree that the networks and some stations independently, with the support of advertisers, have provided, certainly in many instances, a high degree of programing quality for the public?

Mr. Rothery. I say you could go over a broadcast day and select programs out of it that are outstandingly cultural, informational, educational, or entertaining. But in general, taking the broadcast day, I think if a person sat down in front of a television receiver and was forced to listen to everything that went on it for any considerable length of time, he would eventually wind up in a nuthouse.

Mr. Cox. In other words, there are high spots, but you feel the general average of performance——

Mr. Rothery. The high spots are very far between.

Mr. Cox. You referred to the matter of daytime broadcasters in radio and their efforts to get fixed hours for their operations. Isn't it true that if you permit them to operate outside this shifting time period, which is fixed by sunrise and sunset, that you do develop an interference factor with distant stations broadcasting on the same channel?

Mr. Rothery. There is an area between stations on the same frequency which would have interference.

Mr. Cox. Isn't there a chance that that might result in a substantial reduction of service in that area of interference?

Mr. Rothery. No. I think, technically, the problem can be solved by directional rays so as to minimize the interference, and, with the economic feasibility of an extended-day operation, the Commission rules would be served.

Mr. Cox. That is primarily the problem of the daytime broadcaster, isn't it, that he wants to be able to sell advertising and provide programing on a steady basis, rather than on one that ends at odd times in the afternoon?

Mr. ROTHERY. Yes. His day varies all around. His employment goes from sunup until sundown, which is several hours different. And, naturally, what I am thinking of is that the good part of the year when you can sell radio time is during the winter. In the summertime, of course, which is his longest day, is what you might call sustaining time.

Mr. Cox. People aren't in the house?

Mr. ROTHERY. No.

Mr. Cox. With respect to conelrad, that, as I gather it, is a strictly voluntary program, isn't it?

Mr. ROTHERY. Strictly voluntary.

Mr. Cox. This telemetering that you discuss, I gather, eliminates at least one man, or is it more, from attendance on the transmitter?

Mr. ROTHERY. It eliminates complete human attendance at the transmitter, except in the case of emergencies.

Mr. Cox. Where you don't have telemetering—where it is manned—how many employees are concerned?

Mr. ROTHERY. One—one at a time.

Mr. Cox. That may mean two shifts?

Mr. ROTHERY. Depending upon the broadcast day—two shifts normally.

Mr. Cox. If the station is not on conelrad because it doesn't have a manned transmitter and can't make these manual adjustments, is it, under the program, supposed then to go off the air?

Mr. ROTHERY. It goes off the air.

Mr. Cox. Then there won't be any danger that it will serve as a beacon to possible enemy attack forces?

Mr. ROTHERY. There is only this about it. The transmitter is then controlled by a person who is busily engaged in a commercial activity in the studio—an announcer who may be playing records and doing considerable other work around the studio. He is also, in addition to listening to what he is putting on the air, supposed to monitor. This is a confusing thing, and you can't monitor very well. The usual practice would be to turn the monitor down to a point where he could hear it under all conditions, but there may come the condition where he would not hear it.

Mr. Cox. This monitor is the channel through which he would be advised of the emergency?

Mr. ROTHERY. This would be the conelrad key station that he listens to; the other station who is also broadcasting a commercial program.

Mr. Cox. But they superimpose some signal, do they?

Mr. ROTHERY. They superimpose a signal on that, upon the receipt of which all stations not on conelrad are supposed to get off the air.

Mr. Cox. It is your feeling that the personnel manning the transmitter, if it is manned, would be more alert to that than perhaps the busily engaged individual at the studio itself?

Mr. ROTHERY. Yes. They constantly run tests to keep them on the alert. Several times a week a conelrad test is put into effect just to see if they are on their feet.

Mr. Cox. Has there been any demonstrable difference, or aren't these telemetering stations included in those tests if they simply drop out?

Mr. ROTHERY. No, there is no signal on the air for them to hear.

Mr. Cox. They are no longer a part of the system, then?

Mr. ROTHERY. No, they are no longer a part.

Mr. Cox. Is it my understanding, also, that having changed their frequency, the stations that are on conelrad are then supposed to broadcast instructions of a civil-defense nature and things of that sort?

Mr. ROTHERY. Yes, sir.

Mr. Cox. So that this station which has dropped out of conelrad because it doesn't man its transmitter would not be able, at least, to take part in that affirmative part of the program.

Mr. ROTHERY. When you say "broadcast," the entire conelrad unit in an area becomes a single broadcasting station at that point, no one station broadcasting all the time. But by mechanical means, a station may be on the air a momentary portion of the time, and then it goes to the other stations around.

The central conelrad control point then broadcasts. A person listening at home on this frequency hears the complete message, but no station will deliver more than a word or so of it.

Mr. Cox. As to a station that has gone off conelrad, if there remains no station in a community which is still a part of the system, is there some possibility that the citizens of that area will be without information which they otherwise——

Mr. ROTHERY. They would have to get it from some other area. If they were too far away for signals, they wouldn't get it.

Mr. Cox. With respect to this matter of labor disputes in which you feel the FCC has injected itself, that was not in the area of the actual negotiations or anything of that sort between your union and the employer?

Mr. ROTHERY. No.

Mr. Cox. These sabotage charges you referred to in two instances: were those brought during or after the labor dispute had ended?

Mr. ROTHERY. After it had started—before it had ended.

Mr. Cox. During the progress of the strike?

Mr. ROTHERY. During the progress of the strike.

Mr. Cox. Do I understand that you are appealing the one case in which the charge was made?

Mr. ROTHERY. Yes.

Mr. Cox. Are all of your members licensed by the FCC, or do you include also nontechnical personnel of the station?

Mr. ROTHERY. We include nontechnical, but not all technicians are licensed.

Mr. Cox. Just the——

Mr. ROTHERY. Transmitter operators.

Mr. Cox. Only the transmitter operators?

Mr. ROTHERY. That is all that is required by the law.

Mr. Cox. That is, your cameramen and personnel in the studio are not licensed?

Mr. ROTHERY. That is not required.

Senator THURMOND. Mr. Rothery, I wish to thank you for your statement here and for your coming.

There is a statement that has been offered by Mr. Mortimer W. Loewi, vice president of Gerico Investment Co. That will be admitted into the record.

STATEMENT OF MORTIMER W. LOEWI, VICE PRESIDENT, GERICO INVESTMENT CO.

Mr. LOEWI. My name is Mortimer W. Loewi. I am a director and vice president of Gerico Investment Co., permittee of station WITV, operating on UHF channel 17, Fort Lauderdale, Fla. I have heretofore testified before the Potter subcommittee on the problems confronting UHF operators.

My background in television dates back about 22 years, at which time I jointly with Dr. Allen B. Du Mont organized Allen B. Du Mont Laboratories, Inc. For a number of years, until the end of 1951, I was director of the Du Mont Television Network. I have thus had experience in the pioneering of both VHF and UHF.

In its sixth report in April 1952, despite contrary recommendations by Du Mont, the Commission decided to intermix VHF and UHF channels in the same major markets. At that time the Commission allocated 3 commercial VHF channels and 2 commercial UHF channels to Miami, Fla. It allocated 2 UHF channels to Fort Lauderdale, a rapidly growing city approximately 25 miles north of Miami. These allocations were made on the assumption, since proved false, that VHF and UHF stations could coexist side by side in the same markets, and that by intermixing the two types of frequencies, UHF would become an integral part of a single nationwide competitive system.

Gerico Investment Co. applied for and obtained a grant of channel 17 in Fort Lauderdale in 1952. We constructed a 752-foot tower as the so-called Miami "antenna farm" and went on the air in November 1953. We had our difficulties. By reason of the prefreeze headstart of station WTVJ, operating on VHF channel 4 in Miami, almost no sets in the Miami-Fort Lauderdale area (at the time we went on the air) were capable of picking up UHF signals. We were confronted with a terrific conversion problem—getting existing set owners to add UHF converters and getting new-set buyers to spend extra money ($30 to $50) to purchase all-channel receivers.

VHF station WTVJ (channel 4), at the time we went on the air, took its choice of the programs of all four networks (CBS, NBC, ABC, and Du Mont). There were inadequate cable facilities to permit the receipt and transmission of two network shows simultaneously in the Miami area.

However, with only 1 VHF station in operation (the other 2 being tied up in hearing), the people in the area were hungry for a wider choice of programs. Additional cable facilities were installed. With only 3 stations on the air, 2 on UHF, the people in the area soon realized that they had only "half a set" unless they could also pick up UHF programs. The VHF station (WTVJ), as a basic affiliate of CBS, carried the programs of that network. It also had first call on the programs of ABC, but since it could not carry ABC programs at the same time it was carrying CBS shows, we obtained a secondary affiliation with ABC. The other UHF station in the area (WGBS-TV), operated by Storer Broadcasting Co. on channel 23 since December of 1954, had first call on the programs of NBC. Thus, with

NBC and numerous ABC programs available only on UHF, we have made tremendous strides in the past year toward "licking" the UHF-VHF problem. By November of 1955, according to figures released by the Florida Power & Light Co., 90.6 percent of the 300,000 sets in the Miami-Fort Lauderdale area were able to pick up UHF programs. The people in that area, in order to pick up UHF signals, have expended an extra $10 million on UHF converters, bow-tie antennas, and the price differential between VHF-only and all-channel receivers.

Station WITV is now operating with 536 kilowatts of power, directionalized north and south, with an antenna 762 feet above mean sea level. WGBS-TV is operating with an effective radialed power of 186 kilowatts and an antenna 943 feet above mean sea level. Because of the flat terrain and uniform year-round foliage in the area, the UHF stations are providing coverage comparable to that obtainable on high-band VHF (channels 7-13). Because of manmade noise, which has a lesser effect on UHF than on VHF, and particularly because of interference from operations in Habana, Cuba, on two of the same channels assigned to Miami, the UHF stations are providing at least as good a picture in the area as the VHF operation on channel 4, a point which I cannot emphasize too strongly to this committee.

Thus by the end of 1955 the UHF stations in Miami-Fort Lauderdale, facing only one VHF competitor, were doing an excellent job. The area was approaching all-channel saturation. Station WITV, with capital investment and operating losses in excess of $1 million, reached the break-even point.

All this was changed by the Commission's action of January 20, 1956, granting channel 7 to Biscayne Television Corp., and its refusal to stay the channel 10 grant in Miami until deintermixture problems now under investigation by the Commission have been resolved.

The grant to Biscayne, a corporation controlled by a former president of NBC, and by two large newspaper chains, has created an almost unbelievable monopolistic situation. These 2 newspaper chains publish the only 2 metropolitan dailies in Miami; they own the 2 most powerful radio stations in the area (stations WQAM and WIOD); they now have channel 7 in Miami, along with numerous other television interests elsewhere. Against such a combine, an independent UHF operation is at a hopeless disadvantage. Experience has shown that UHF stations have not been able to survive, except at a financial loss, in markets served by 2 or more VHF stations affiliated with the 2 principal networks (CBS and NBC). With the January 20 grant to Biscayne, Storer's UHF station (WGBS-TV) will lose its NBC affiliation, and when channel 10 is granted, WITV will be deprived of such ABC programs as have not in the meantime gone to the VHF stations on channels 4 and 7.

Experience has further shown that when the programs of the two leading networks (CBS and NBC), along with high-rated programs of ABC, are obtainable on VHF, the UHF stations lose their audience. With the loss of audience they lose their national and local spot business, and with the loss of revenues they can no longer operate in the public interest. With most of the network programs on VHF, the public has no particular incentive to pay another $30 to $50 for all-channel sets or UHF converters. There is no reason to keep existing UHF converters in repair.

The market soon becomes flooded with new VHF-only sets and conversion problems (which we have almost licked during the past

2 years) start all over again, and with 3 VHF stations in operation the UHF stations no longer have the good programs to induce the public to reconvert to all-channel receivers.

After heavy initial capital expenditures and substantial operating losses during the early conversion period, and seeing what was happening in other markets upon the advent of a second or third VHF station, we foresaw what was coming in Miami if the Commission adhered to its 1952 decision to grant three VHF stations in that area. Accordingly, on April 14, 1955, within 15 days after the Commission decided to hold hearings on certain deintermixture proposals, my company joined Storer Broadcasting Co. in petitioning the Commission to deintermix Miami-Fort Lauderdale. Our proposal as amended included the 6 principal cities of Florida and 2 cities in Georgia.

Our joint proposal, as we pointed out to the Commission, had certain definite advantages.

At the present time, cities like Orlando, Jacksonville, Tampa-St. Petersburg, and Savannah, are limited, as a practical matter, to 2 equally competitive television services, an insufficient number to take care of the 3 national networks.

Under our proposal, by removing channels 7 and 10 from Miami, each of these cities—Orlando, Jacksonville, Tampa-St. Petersburg, and Savannah—would be assured a third equally competitive facility; Brunswick, Ga., would obtain a second; Miami-Fort Lauderdale would still have 3 stations—1 VHF and 2 UHF—with room for additional UHF stations now and in the years ahead.

In contending that Miami-Fort Lauderdale should become a predominantly UHF market, limited to a single VHF channel, we pointed out the following advantages:

(1) By reason of WITV's and WGBS's pioneering, Miami-Fort Lauderdale is rapidly being transformed into an all-channel market, in line with desires expressed by the Commission in its sixth report.

(2) The public has a vast investment in UHF receivers and antennas in the Miami area, currently in excess of $10 million, which will go for naught with the advent of additional VHF operations in that market.

(3) Miami, because of its proximity to Habana and tropospheric problems in the South, is suffering serious interference on VHF which will be avoided entirely on UHF.

(4) The flat terrain and uniform year-round foliage in Miami is ideally suited for UHF.

(5) The coverage on UHF is roughly comparable to that which can be had on channels 7 and 10 in the Miami area.

(6) Successful UHF operations in Miami will have a tremendously beneficial impact on UHF development nationwide. Miami is rapidly becoming an important originating point for network programing. Successful UHF operations in Miami would go a long way in overcoming the present skepticism of some advertising agencies, network officials, time buyers, and set manufacturers after they have seen at first hand the potentials and advantages of UHF in this area.

In order that our deintermixture proposal for Florida and a portion of Georgia would not be rendered moot by intervening VHF grants in Miami, we asked the Commission not to grant channels 7 or 10 until it had taken final action on our deintermixture proposal. In July 1955 Chairman McConnaughey assured this committee that no grants would be made in cities where deintermixture proposals were pending until the deintermixture problem was settled.

However, on November 10, 1955, the Commission dismissed some 35 such petitions, without prejudice to their subsequent reconsideration on the merits in a general rulemaking proceeding ordered that same day. Our petition was not considered on its overall merits. The Commission, as Chairman McConnaughey advised you on February 20, has not yet rejected deintermixture. But with the general rulemaking proceeding going on and with my company presenting its views in that proceeding, the Commission is going ahead with VHF grants which foreclose favorable action at a later date on our deintermixture proposal.

The grants of channels 7 and 10 in Miami will not mean additional television service in that market. The people in that area are already receiving the programs of all three existing networks (CBS, NBC, and ABC). The coverages of UHF stations in the Miami-Fort Lauderdale area are roughly comparable to the coverage which the VHF stations will have. The two new VHF stations will simply replace existing services now being provided by the two UHF stations. The public will receive no benefits. In fact, Fort Lauderdale will be left without a station of its own.

Once the public buys sets and makes highband installation in reliance on channels 7 and 10, deintermixture in Miami is no longer feasible. With the Commission assuring this committee that it will reach a decision within the next few months on deintermixture, the Commission should refrain from making additional VHF grants in markets where deintermixture proposals are pending. If those VHF stations are allowed to go on the air, it will not be in the public interest to require those stations to move to UHF at a later date. The public will have made extensive investments in reliance upon those new grants.

In order that the Commission may tackle the problem on its merits, unfettered by intervening VHF grants which it has made since November 10, 1955, in markets where deintermixture has been proposed, it is my recommendation that this committee direct the Commission, a legislative arm of Congress, to suspend such grants until it reaches a decision within the next few months on the overall problem of deintermixture.

The vast majority of comments filed to date in the general rulemaking proceeding now in progress favor deintermixture in some form. Deintermixture is endorsed by such organizations as NBC, ABC, General Electric, Westinghouse, General Teleradio, Storer Broadcasting Co. If the Commission still has an open mind in these matters, as it professes to have, it should not be making VHF grants today in areas where, a few months from now, it may be required to institute involved legal proceedings to compel such grantees to shift to UHF.

I thank the committee for this opportunity to state my company's views regarding the desirability of deintermixing the Miami-Fort Lauderdale area.

Senator THURMOND. Are there any other statements to be offered in evidence this morning?

The next meeting of the committee will be held in the caucus room on March 26 at 10 o'clock.

The committee now stands adjourned until that time.

(Whereupon, at 11:50 a. m., the committee adjourned, to reconvene at 10 a. m., Monday, March 26, 1956.)

TELEVISION INQUIRY

(UHF-VHF Allocations Problem)

MONDAY, MARCH 26, 1956

UNITED STATES SENATE,
COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE,
Washington, D. C.

The committee met, pursuant to adjournment, at 10 a. m., in room 318, Senate Office Building, Washington, D. C., Senator Charles E. Potter presiding.

Present: Senators Potter, Pastore, Schoeppel, and Bricker.

Also present: Wayne T. Geissinger, assistant chief counsel; Kenneth A. Cox, special counsel; Nicholas Zapple, staff communications counsel.

Senator POTTER. The committee will come to order.

We are resuming our hearing this morning on the television-allocation problem, although our first witness is going to discuss other matters. We have had testimony from UHF and VHF licensees and now we are going to hear from representatives of the networks. Before calling on our first witness, however, we have a number of items for insertion in the record.

First, a letter dated March 15, 1956, from the American Farm Bureau Federation, urging continuation and extension of radio and television service to rural areas.

Second, a letter dated March 16, 1956, from Benedict P. Cottone, enclosing a copy of a letter to Hon. George C. McConnaughey, Chairman of the Federal Communications Commission, from Frank Lyman, Jr., of Middlesex Broadcasting Corp., advising that UHF station WTAO-TV, of Cambridge, Mass., will go off the air on March 30, 1956, and outlining the reasons for such action. Mr. Lyman testified before this committee on February 27, 1956, regarding the problems of a UHF station operating in the shadow of a large city with multiple VHF services.

Third, a statement of Arthur W. Scharfeld on behalf of Radio Wisconsin, Inc., permittee of Madison, Wis., television station WISC-TV.

(The documents referred to are as follows:)

AMERICAN FARM BUREAU FEDERATION,
Washington, D. C., March 15, 1956.

Hon. WARREN G. MAGNUSON,
Chairman, Senate Committee on Interstate and Foreign Commerce,
Senate Office Building, Washington 25, D. C.

DEAR SENATOR MAGNUSON: The American Farm Bureau Federation—a general farm organization with 1,623,222 member families in the 48 States and Puerto

Rico—is concerned about proposals to increase the number of television channel allocations currently under consideration.

Your committee, in the conduct of hearings on this subject, will, of course, give thoughtful consideration to the effects of any proposal which might reduce the effectiveness and power of television stations bringing education and entertainment into rural homes.

Many farm people, particularly those far removed from urban centers, depend on communications media such as television for information and recreation even more than do city and suburban residents. A recent survey by the industry indicates that 40 percent of the rural residents of the Nation now have television sets.

Any move which might retard the growth of TV service to rural areas by a reduction in the transmission effectiveness of existing stations would seriously impair the increasing value of this media to farm families.

At the December 1955 annual meeting of the American Farm Bureau Federation, the following policy resolution was adopted by the official voting delegates of the State farm bureaus:

"Radio and television broadcasting provides an invaluable service to rural areas and farmers. We strongly support the efforts made by the industry to expand and improve its coverage of news and farm affairs.

"We urge that the Federal Communications Commission give close scrutiny to the issuance of licenses and guard against any lowering of high standards of public service which might vitally affect programing and reception for farm families.

"Reduction of broadcasting interference, particularly as it applies to clear channel stations, is a constant challenge to governmental agencies and industry groups. We are firmly opposed to any Government regulations which might reduce, or threaten to reduce, service to rural listeners."

We respectfully request that this letter be made a part of the record of the hearings being conducted with regard to this matter.

Yours very truly,

JOHN C. LYNN,
Legislative Director.

COTTONE & SCHEINER,
Washington, D. C., March 16, 1956.

Hon. WARREN G. MAGNUSON,
Chairman, Interstate and Foreign Commerce Committee,
Senate Office Building, Washington, D. C.

MY DEAR SENATOR MAGNUSON: I am transmitting herewith a letter dated March 13, 1956, from station WTAO–TV, Cambridge, Mass., to the FCC advising of the necessity of termination of the station's operation as of March 30, 1956.

It would be appreciated if this letter and the attachments thereto could be made a part of the record in the hearings which are now being conducted by your committee with respect to the UHF problem.

Sincerely yours,

BENEDICT P. COTTONE.

MARCH 13, 1956.

Hon. GEORGE C. MCCONNAUGHEY,
Federal Communications Commission, Washington 25, D. C.

DEAR MR. CHAIRMAN: This is to advise you that effective as of March 30, 1956, UHF station WTAO–TV will suspend operations pending further developments in the current UHF crisis.

For me to detail for your information the reasons why we are forced to take this step would be carrying coals to Newcastle. Our story has its counterpart in the stories of the 57 UHF stations that have been forced to the wall since the adoption of the ill-fated television allocation plan which intermixed VHF and UHF channels in the same markets.

Our situation differs from the case of those who have gone dark before us, only in the fact that we should probably have taken this step months ago. We have refrained from doing so only because we thought we had reason to hope, during the past 2-year period, that the UHF problem was under careful study and that there would soon be forthcoming constructive proposals which would make it possible for UHF operators to continue to serve the public. However, hope ceases to spring eternal when a certain point in suffering is reached. I regret to advise you that in the case of WTAO–TV that point has been reached.

Middlesex Broadcasting Corp. has been rooted in the Cambridge community for many, many years, through its operation of AM station WTAO and its FM station WXHR. These have been modest operations; for it has been our chief objective to provide the city of Cambridge with service that more particularly meets its needs and tastes. We went into television with this same basic objective. When we did so, we placed our faith in the Commission's allocation plan and in pronouncements holding out rosy expectations as to UHF's capacity to serve as an effective public medium. Fortified by this faith, we placed our resources, experience, and effort into building a worthwhile television service for our community. Brief but eloquent testimony to that effect is attached to this letter. Two factors have now demonstrated that faith and those expectations to have been ephemeral. The first is the almost insuperable obstacle of incompatibility created by the Commission's intermixture in the Boston market of VHF with UHF channels. The second is the tremendously superior coverage and other economic advantages which the Commission's allocation plan gives to VHF stations. With respect to this second factor, we have found that we have hopelessly been trying to compete with two superpower commercial VHF stations in Boston (with a third on the way). We have been trying to compete for programs, revenues, and audience under the terrific handicap that our signal, even if it could be received by all receivers within our service area, could not reach the tremendously greater areas reached by each of the Boston VHF stations. Indeed, this inequality of competitive opportunity has recently been further aggravated. In addition to the competition of the Boston VHF stations, we now must contend with a Manchester VHF station, whose home community is about 50 miles from Boston, and which has been openly wooing national and local Boston area advertisers with proud claims as to how effectively the station serves the Boston area. This, of course, has resulted from the tremendous coverage areas which the Commission's present superpower, superheight rules have staked out for VHF stations.

To our way of thinking, the Commission's allocation plan, plus the types of day-to-day action which the Commission has been taking over the period of the past 2 years, have been breeding a dangerous monopoly in the most powerful medium of mass communications ever yet devised. The present trend must inevitably lead to disastrous consequences to the public and to the small-business entrepreneur. We take pride in the fact, perhaps foolishly, that we have had only small-business pretensions. We now see no possible way that we may continue to hold even such modest pretensions in the television field since we foresee no early and tangible indication that the climate will change sufficiently to make small-business aspirations worth while. We trust that we are wrong.

There have been some indications that the next 6-month period should produce developments which will (*a*) either create such a more favorable atmosphere for development of nationwide competitive television system in which the small operator can live; or (*b*) seal the perpetual doom of any such television system. Insofar as our situation is concerned, we have advanced to the Commission, in its pending reallocation proceedings, a deintermixture proposal which appears to offer some hope of a more truly competitive television situation in the Boston-Cambridge area. Although we are forced to suspend our operations, we will continue to hope and press for such developments to the end that we may be able, in such period, to resume television service on a basis whereby we could more effectively serve the public than has been possible in the past.

Very truly yours,

MIDDLESEX BROADCASTING CORP.,
FRANK LAYMAN, Jr., *President.*

EXTRACTS FROM LETTERS ON FILE AT WTAO–TV

"The Cambridge old age and survivors insurance district office serves some half million people in Middlesex County. WTAO–TV is the only commercial television station abailable for the important local tie-in."—Gerald J. Murphy, district manager, Social Security Administration.

"We were pleased to know that an attempt is being made to move WTAO–TV to a regular VHF channel. We feel that stations such as WTAO–TV contribute tremendously to the Commonwealth in all aspects of public relations as well as education."—Edith Povar Schneider, executive director, United Cerebral Palsy of Boston, Inc.

"I want to express my deep appreciation to you for the splendid civic interest displayed by WTAO–TV. I was delighted to participate in the series of programs you ran on State affairs. It was my deep regret that these shows did not have a wider audience."—Sumner G. Whittier, Lieutenant Governor, the Commonwealth of Massachusetts.

"We wish you well in your attempt to bring WTAO–TV to the regular television channels feeling that the same attitudes shown in your radio work will contribute to our community through your television programing."—George E. Gardner, pastor, Cambridge Baptist Church.

"I have heard recently of WTAO's attempt to move to a regular VHF channel. I can only say that everyone at United Community Services is behind you in this new effort. It would be a boon to every person in Greater Boston for a station as public spirited and cooperative as WTAO to obtain a VHF channel."—June E. Lord, radio-television director, United Community Services of Greater Boston.

"I understand you are making every effort to move WTAO-TV to a regular VHF channel. I certainly hope your efforts will be successful. In our opinion there is room and a real need for favorable action on your application."—Charles S. Wilson, executive director, Bay State Society for the Crippled and Handicapped, Inc.

"If you can obtain a regular VHF channel in the near future there is no doubt that the folks of the Cambridge area will be pleased. A VHF channel will lend itself to building a bigger and better Cambridge. May you have success in your endeavors."—Edwin J. Freeh, captain, Salvation Army.

"I feel sure that if a VHF license is granted, WTAO–TV will continue its outstanding record of public service."—Maj. Jay V. Poage, officer in charge, United States Marine Corps.

"The city of Cambridge should have a television voice such as your which can devote its attention to local endeavors."—William E. Maxson, head master, Lesley-Ellis School.

"We wish a successful attempt to have your station moved to a regular VHF channel."—Doris M. F. Mack, district director, Campfire Girls.

"While I am thanking you for what you did for the the heart fund during the campaign, I want to add my congratulations for the part WTAO–TV took in presenting a pioneer project initiated by the Massachusetts Health Council, of which group I am vice president. Your station exhibited courage and leadership in a new field of health education which participating agencies value highly."—Charles A. Gates, executive director, Massachusetts Heart Association, Inc.

"* * * so be assured of our good wishes and prayers for the success of your efforts to secure for WTAO–TV from the Federal Communications Commission a regular VHF channel so as to be on the truly equitable basis which the American system of broadcasting strives to maintain."—Father Matthew Hale, S. J., director, Sacred Heart program, Boston.

"I sincerely hope that station WTAO–TV can be moved to a regular VHF channel and remain on the air."—Ruth S. Signor, associate director, Girls' Clubs of Boston.

"We know we need at least the number of stations which have been allocated so that we might avoid the problems of the pre-1946 radio situation when a market cornered by a few did not promote good competitive programing and engineering practices and yet it is not an equitable situation when the ability to compete is not equalized. This the Federal Communications Commission in all justice and fairness must solve. We certainly wish you well."—Joseph E. Porter, acting director, Massachusetts Council of Churches.

"It goes without saying that the chapter wishes you well in your attempt to secure a regular VHF channel."—John F. Bean, executive director, Cambridge Chapter, American Red Cross.

"This letter is to present my thanks to you and your staff at WTAO–TV for your very able assistance to the Cambridge Civil Defense Agency and thereby to the citizens of Cambridge during the hurricane seasons of 1954 and 1955. I hope you will be successful in obtaining a regular VHF channel so that you can compete on a more equal basis with other stations thereby extending your range of public service to a greater number of people in this area."—Deputy Chief Edmund N. Burke, Director of Civil Defense, Cambridge, Mass.

"I want you to know that the department wishes you well in your effort to secure a regular VHF channel."—Charles E. Downe, acting commissioner, department of commerce, Commonwealth of Massachusetts.

"I want to take this opportunity to thank you and station WTAO–TV for its fine cooperation with the World Affairs Council. I hope you will take every step possible to become a regular VHF channel. I am convinced Boston needs another VHF channel and I certainly hope it goes to WTAO–TV."—John S. Gibson, executive director, World Affairs Council.

"Word has reached us that station WTAO–TV has applied for a VHF channel and we want to go on record as wishing you success."—Francis A. Hunt, information service representative for New England Veterans' Administration.

"We do wish you success in your attempt to move WTAO–TV to a regular VHF channel. Whatever you can do to stabilize your own situation will be an asset to the Greater Boston area."—Alden Eberly, assistant general secretary, YMCA.

"You and your associates may be proud of the way you have handled the UHF situation under severe difficulties and I know from personal experience that there is great respect for your operation. I have watched with a degree of sadness the loss of UHF operations in Maine, Providence, and Worcester and can only hope that your attempt to move WTAO–TV to a regular VHF channel will be considered with favor by the Federal Communications Commission."—Robert A. Price, publicity director National Association of Manufacturers.

"In spite of the limitations which circumstances have placed upon WTAO–TV in the past you have given the public schools every possible consideration. We feel with a regular VHF channel you will be able to provide us a far greater opportunity to present programs of educational and civic work."—Dennis C. Haley, superintendent of public schools, Boston.

STATEMENT OF ARTHUR W. SCHARFELD ON BEHALF OF RADIO WISCONSIN, INC., PERMITTEE OF MADISON (WIS.) TELEVISION STATION WISC–TV [1]

My name is Arthur W. Scharfeld, and I am submitting this statement today as attorney for Radio Wisconsin, Inc., licensee of Madison radio stations WISC and WISC–FM, and permittee of television station WISC–TV now under construction on channel 3 at Madison, Wis. I have been active in communications law practice before the Federal Communications Commission and its predecessor, the Federal Radio Commission, for over 25 years and have represented Radio Wisconsin during the more than 8 years it has actively sought an authorization to operate a TV station to serve Madison and the surrounding area of south-central Wisconsin.

I would like to clarify the many misleading and inaccurate seatements made in the present hearings before this committee in the statement filed on behalf of Monona Broadcasting Co., licensee of television station WKOW–TV, Madison, Wis. Monona operates 1 of 3 UHF television stations in Madison and participated in the rulemaking proceedings leading to the adoption of the sixth report and order, as well as in subsequent proceedings of recent date when it did an about-face on its previous representations to the Commission.

Monona seeks to create the impression that it applied for its UHF assignment at the instigation of the Commission and without knowledge of the general superiority of VHF operation; it would lead you to believe that it virtually received a guaranty from the Commission of successful commercial operation and that it would be insulated from local VHF competition. Such are not the true facts, since the Commission did neither.

Paradoxically, Radio Wisconsin originally proposed in the proceedings which resulted in the allocation plan that all Madison commercial television assignments be placed in the UHF. This was proposed to avoid the unheathly situation of having stations in the UHF band (then being opened up for the first time) face the disadvantage of substantial ownership of VHF-only sets should a VHF station go on the air first. Under the circumstances then existing of unavailability of UHF transmitters, equipment, or receivers, this was a serious threat to the possible successful operation of UHF stations which got on the air subsequent to the VHF for which both equipment and receivers were available. Monona, however, in its pleading filed at that time with the Commission, attacked such proposal as "a gross subversion of the public interest and a waste of natural resources" and insisted that VHF channel 3 be retained in Madison as specified in the allocations plan. It further argued that our proposal could not be applied on a limited, local basis—i. e., only to Madison—but must be applied, if at all, upon a national scale. This, incidentally, is precisely the ground upon

[1] In connection with this statement, see contrary statement of Stewart Watson, president of Monona Broadcasting Co., of Madison, Wis., printed on p. 639.

which the Commission denied Monona's recent belated proposal for so-called selective deintermixture.

Monona has had full opportunity to present its views to the Commission beginning in 1951—and it has exercised that opportunity by first taking one position which it deemed to be personally beneficial and then taking the opposite view when that seemed to serve its purpose—even to the extent that it would perform a public disservice. Not satisfied with the Commission's refusal to sanction its tactics for delaying television service to the people of Madison and the State of Wisconsin, it has appealed to the courts, as it may properly do under the statute, but now, despite its purported disclaimer, it is urging this committee to determine the very same issues presented to the court of appeals.

In neglecting to detail or describe the basic characteristics of its proposal for selective deintermixture Monona endeavors to leave the impression that this is a very simple matter to be accomplished without difficulty under the Commission's allocations plan. It proposes that VHF channel 3, allocated under the sixth report and order for service to Madison and surrounding area, should not be used as assigned merely in order to protect WKOW–TV from economic competition of a VHF station that was assigned to Madison and available to Monona at the same time as Monona accepted its UHF assignment. This proposal represents then a drastic reallocations technique, running counter to significant principles of television development heretofore applied by the Commission under congressional mandate. Here I have reference to section 1 of the Communications Act calling for the widest possible extension of television service, section 307 of the act requiring a fair, efficient, and equitable allocation of TV channels to the several States and communities, and to that equally fundamental principle, enunciated by the Supreme Court in the *Sanders Bros.* case (309 U. S. 470) (and now imbedded in the Communications Act) that broadcasting's economy is one of free competition.

The Commission's sixth report and order set up the present nationwide table of TV assignments based on certain underlying allocations principles. Intermixture of VHF and UHF was such a major principle and it was applied both generally as well as specifically in Madison. The Commission then repeatedly stressed VHF's many advantages over UHF, ranging from VHF's established nature and the ready availability of VHF equipment through VHF's superior propagation characteristics and lower operating costs. No one then doubted VHF's greater superiority from economic as well as technical points of view, as shown alone by the emphasis on VHF by hundreds of parties first seeking VHF allocations and then filing VHF applications. Almost all of the protracted comparative hearings were for VHF stations, while in UHF quick, cheap, and uncontested grants were the rule. Because of intermixture of VHF and UHF in Madison and the concentration of 3 of 5 Madison applicants on its one VHF channel, Monona and the other Madison commercial UHF station, WMTV, obtained just such UHF grants. Going on the air in mid-1953, they have had a 3-year head start over Madison's VHF just recently emerged from a long, arduous, and expensive comparative hearing.

This substantial head start by three Madison UHF stations (including an educational station) where there was no preestablished VHF has enabled UHF to achieve a uniquely entrenched status in that city, perhaps unequaled anywhere else in the United States. Among the factors so responsible is the admittedly complete (99 percent) UHF set saturation in the area (i. e., all sets but 1 percent are UHF sets), plus the acceptance of Madison UHF by the viewing audience, advertisers, and national networks. WKOW–TV has a major network affiliation and station WMTV has two. Indicative also are recent news stories in both the trade and local Madison press indicating that station WMTV is to be sold to the two Madison newspapers for approximately $600,000 for a two-thirds interest in that station (the Madison Capital Times, March 7, 1956, p. 1; Broadcasting-Telecasting, March 12, 1956, p. 79). Madison is perhaps the classic city in the United States in which intermixture should work effectively as the Commission contemplated. In short, no intermixture problem has been shown to exist there.

Not satisfied with its entrenched position as an operating TV station in Madison, WKOW–TV as well as WMTV, have sought through the device of selective deintermixture to abort the competition anticipated since 1952 from the local VHF. To do so, Monona claims inability to compete with a local VHF station solely in reliance upon ambiguous data from the experiences of UHF stations elsewhere in the United States that are totally irrelevant and inapplicable to the Madison situation. These instances occurred mainly in dissimilar circumstances where UHF sought to compete with preestablished VHF stations, VHF service, and large numbers of outstanding VHF-only receivers. Substantially different results have obtained where the UHF stations, as here, have had a head start over VHF. In fact, no adverse competitive effects from VHF, as such, have ever been shown for UHF stations as deeply entrenched as they are in Madison.

Monona alleged economic insecurity but never offered the Commission a single financial statement as proof. Its assertion (without detailed sustaining data) of an overall operating deficit, has little meaning since FCC data shows that all postfreeze VHF stations have, in the aggregate, also suffered substantial overall operating deficits. Today's allocation problems are not confined to the UHF alone, since postfreeze VHF stations have also gone off the air and certainly are not caused by intermixture per se, since many failing UHF stations had no competition whatever from a local VHF.

The Commission afforded Monona and other UHF stations a careful and comprehensive rulemaking proceeding on their proposals for selective deintermixture in Madison and four other cities. The Commission, on the record of that proceeding, found no merit in these proposals and denied them on the basis that selective deintermixture was an unsound and defective approach to the problem. Such major departures from existing standards and principles, it concluded, could not meaningfully be considered on that limited and isolated city basis but only on the nationwide basis invariably used for general TV reallocations. Accordingly, it simultaneously commenced such a general proceeding in docket 11532 which is now underway. In it the Commission is considering a vast variety of proposals running the gamut of possible allocations actions, including as one possibility proposals for deintermixture on a nationwide basis.

In attacking the Commission's action granting a station on Madison channel 3, Monona incorrectly makes it appear that this was a hasty action, whereas actually the matter has been under consideration in one form or another since 1948 when applications for Madison's VHF station were first filed. The hearing on competing VHF applications for Madison's channel 3 commenced in August 1953, and its record closed in December of 1953. Radio Wisconsin, as well as any applicant for VHF channel 3, had statutory rilghts on its own part to a full, fair, and reasonably expeditious determination of its application, and the delay has already deprived the people of Madison and surrounding area for too long a time of their first VHF service authorized by the 1952 sixth report and order.

VHF service has provided the mainstay for our nationwide TV system, particularly in serving rural and agricultural areas remote from population centers. WISC-TV on Madison channel 3 will provide 80,000 people in Wisconsin with their first and only recognized TV service, as well as bring a second, alternative recognized service to additional tens of thousands. WISC-TV's service to "white areas," otherwise without any recognized service, is a conclusive fact, established in the proceedings before the Commission by reliable data utilizing established engineering standards. While Monona disputed such data before the Commission and again in its statement to this committee, it never offered anything having the slightest reliability to the contrary. Its contentions—based on unrecognized, skimpy, and incredible statistics—were untenable, if not nonsensical.

To show that there was some (nonrecognized) TV service given to these 80,000 persons in an area of 2,631 square miles, Monona relied on a total of 408 responses to 976 phone calls made to residents of 9 towns on the area's periphery. From these, it sought to evolve data allegedly applicable to the entire area, including the incredible assertion that people 125 miles away from a TV station received what Monona deemed satisfactory service. Monona's purported offer of a house-to-house canvass was only made out of hand by its counsel when faced with disproof of its existing data during final oral argument as late as July before the Commission; this itself admitted the inadequacy of its data. Similarly meaningless is Monona's statement that it committed itself to increase its facilities should the area be deintermixed. This, too, admits that channel 3 coverage is greater. In any event, the use of increased facilities has been available to Monona from the commencement of the proceedings, and it is a poor excuse at this time to offer to provide more service if the Commission deletes VHF from Madison; there is scarcely a businessman who would not so expand to fill the vacuum created by the Government's aborting of its rightful competition.

I might point out that no competitive equalization of facilities exists in AM radio which utilizes several distinct grades of service to meet the country's overall radio needs. For example, Madison has three AM radio stations, of which Monona's WKOW has the widest coverage and regularly advertises its higher power on a more favorable frequency that Radio Wisconsin's WISC. Both stations operate, however, with differences in audience, advertising, and programing related to coverage differences. Much, if not precisely the same, situation will develop in Madison television with both VHF and UHF stations on the air. Monona, however, seeks the equalization of TV facilities only—at the expense of the viewing public as well as of the successful VHF applicant for channel 3.

The Commission, in my opinion, has properly discharged its statutory obligations as to television development in Madison in the light of existing facts and circumstances. It has properly prevented further unreasonable delay in bringing new television service to Madison and to a substantial segment of the State of Wisconsin now without recognized service. Monona challenges these administrative actions before the committee but the distorted and incomplete statement made on Monona's behalf has provided nothing upon which the committee can or should rely in attempting to evolve policies that will promote the further development of television service.

Senator POTTER. Our first witness this morning will be Mr. Richard A. Moore of station KTTV, Los Angeles, Calif., who will discuss, I understand, the matter of certain network practices as they affect the operation of independent stations and the public interest in general.

(For the testimony of Mr. Moore and of Prof. Donald F. Turner of Cambridge, Mass., who addressed himself to the legal aspects of these problems, see the testimony for this date set out in the later volume on Network Practices.

(During the afternoon session, testimony was heard from Mr. Ernest Lee Jahncke, Jr., vice president and assistant to the president of the American Broadcasting Co. His testimony was as follows:)

Senator POTTER. Mr. Jahncke, vice president and assistant to the president of the American Broadcasting Co.

STATEMENT OF ERNEST L. JAHNCKE, JR., VICE PRESIDENT AND ASSISTANT TO THE PRESIDENT, AMERICAN BROADCASTING CO.

Mr. Jahncke, we are delighted to have you appear before the committee. About 2 years ago you were here in a similar capacity, I recall.

Mr. JAHNCKE. Yes, sir, Mr. Chairman. I am very happy to have the opportunity, again, to express the point of view of American Broadcasting Co. I might say I hope this is my last appearance on this subject and that the problem will be solved in the next 2 years, sir.

Senator POTTER. We had that hope 2 years ago, didn't we?

Mr. JAHNCKE. Yes, sir.

Senator POTTER. Mr. Jahncke, do you have some associates with you who might be testifying? If you would care to introduce them now for the record, you may do so.

Mr. JAHNCKE. Yes, sir.

May I introduce, on my left, Mr. Frank Marx, vice president in charge of engineering of the ABC, who is qualified to speak on any engineering questions or aspects that may come up; behind me, Mr. James McKenna, ABC's Washington attorney, and Mr. Joseph Jacobs, of ABC's New York legal staff.

Senator POTTER. I notice you have a prepared statement here. What is your pleasure? Do you care to go through the statement without interruption and have the questions at the conclusion of your statement?

Mr. JAHNCKE. No, sir; that wasn't my intention, Mr. Chairman, not that I wouldn't be most willing to be interrupted at any time. I hope I can complete my testimony, with interruptions and questions, rather than being recessed and called back later.

Senator POTTER. All right. You may proceed.

Mr. JAHNCKE. My name is Ernest Lee Jahncke, Jr. I am vice president and assistant to the president of the American Broadcasting Co. ABC welcomes again the opportunity of testifying before this distinguished committee on the grave problem of television allocations.

In connection with the testimony of Mr. Moore,[1] I would like to say that ABC would like to have the opportunity to speak to that testimony and I understand we will have that opportunity at a later date when network practices are discussed.

Senator POTTER. That is correct.

Mr. JAHNCKE. However, I would like to make 1 or 2 observations at this time, if I may, as they relate to allocations, first of all—and they will all be made under the general point that I disagree completely with Mr. Moore's statement.

I think Mr. Moore has in great part presented the opinions of ABC, but he arrived at the wrong conclusions. I think everything he said is an effect, not a cause. I think it all stems from the economy of scarcity, of not enough outlets—from the position of monopoly and duopoly that exists because we have not been able to have free access to the market place or enough TV stations to serve the public interest.

He cited that in radio you don't have these pressures only because the scarcity has been eliminated. I submit that the main concern of this committee is to eliminate that same scarcity. I submit that the various plans that have been proposed to solve this problem are not as different as has been suggested and that immediate action is absolutely essential.

Senator PASTORE. In other words, what you are saying, Mr. Jahncke, is that a lack of competition exists because of lack of facility rather than lack of regulation?

Mr. JAHNCKE. I think, Senator Pastore, that regulation stems from scarcity. You eliminate the scarcity, you eliminate the necessity for regulation—and free competition will act in the traditional American Government situation.

For example, ABC owns its own TV stations, but we operate only in markets that have at least 3 competitors, in addition to ourselves, and have since 1948. As a network operating individual TV stations we are just as concerned with our obligation to serve the public interest locally and nationally as any other licensee. We have competed in New York against 6 competitors; in Los Angeles against 6 competitors; in Chicago against 3; in San Francisco against 2 and now 3; and in Detroit originally against 2 and now 3.

Senator PASTORE. As contrasted with the situation in New York, what is your predicament in relation to localities where they only have 1 station or 2 stations?

Mr. JAHNCKE. We don't own any stations in such markets, sir, and we rarely, if ever, have the opportunity to have an affiliate in such a market.

Senator PASTORE. I am not speaking of affiliates. I mean insofar as your network activities are concerned.

[1] See note on p. 752 above. The portions of Mr. Jahncke's testimony relating to Mr. Moore's testimony are also printed in connection with the latter in the volume on Network Practices.

Mr. JAHNCKE. Our network activity in respect to 1- or 2-station markets is a ceaseless activity, usually futile, to get access or persuade these duopoly markets to even schedule an ABC program.

I would like to refer to a couple of specifics in Mr. Moore's testimony. On page 11 of his testimony he listed 40 markets in discussing "must buy" policies. I only mention it because I would like to read the 16 markets that are neither "must buys," nor any other buys on ABC. They are the 16 markets to which we don't even have access. They are Boston, St. Louis, San Diego, Louisvile, San Antonio, Tampa, Rochester, Omaha, Syracuse, Oklahoma City, Sacramento, Norfolk, Providence, Davenport, Dayton, and Birmingham.

When we talk about competition—we don't compete in these places. We don't have equal access to these market places. I would like to refer to another part of Mr. Moore's testimony, on page 5, where he refers to his operation in connection with the Salk broadcast. I think KTTV's operation on that date was most commendable, but I make two observations: One, had it not been for the regular network use of A. T. and T. facilities, those facilities would not have been there, available and waiting, for Mr. Moore to buy them from Michigan to Los Angeles on that 1 particular occasion for 4 hours. A. T. and T. cannot maintain their lines for 4 hours a year. Secondly, I suggest that perhaps Mr. Moore's operation at that point was more in the nature of a temporary network, rather than as a poor, lone, independent station. We of ABC were happy to join in that network in both our Los Angeles and San Francisco stations, and, as my memory recalls, we did pay our proper share of the cost involved.

Senator PASTORE. With relation to these markets that you have just recited, including the city of Providence, how would that 75-percent rule that was suggested by Mr. Moore affect your network? Would it be bad, or wouldn't it have any effect at all?

Mr. JAHNCKE. Senator, I refer to that in my statement. I think any percentage figure is arbitrary. Mr. Moore chose 75 percent of 3 evening hours. Perhaps there are 4 or 5 or 6 evening hours, if we get 75 percent for 5 hours, perhaps it is more than any network is using today. I think, therefore, that any percentage figure subjects you to the arbitrary trap of substituting numerology for commonsense. As to whether—I don't think it is a question of whether the network uses too much. I think the network programs—I disagree with Mr. Moore, I don't think they are inferior. I think they are in the public interest.

I don't think that stations are fighting not to take network programs. Quite the reverse, as I understand it. Of course it is not my network, but stations find the privilege of being listed as a "must buy" an important asset, which is another way of saying that they are very desirous and happy to take network programs. The very popularity of network programs seems to me suggests they are in the public interest.

Mr. COX. If they are listed as a "must buy," it relieves them of the obligation of selling their prime time, doesn't it, substantially—95 percent at least?

Mr. JAHNCKE. I didn't quite get that, Mr. Cox.

Mr. COX. If the individual affiliate is listed as a "must buy," by either NBC or CBS, to the extent that Mr. Moore's statistics are reliable as to the percentage of time cleared, they have been relieved of the necessity of selling their prime time?

Mr. JAHNCKE. In my opinion it is not a question of being relieved of necessity. When a station affiliates with a network, part of that arrangement is that the network acts as the national sales agent. And to be listed as a "must buy" is a device between the sales agent and the advertiser, saying that the advertiser has to order. The station reserves its regular right as a licensee to accept or reject a program, depending upon whether, in its opinion as licensee, it is in the public interest. The "must buy" is a pressure on the advertiser, not on the affiliate, who merely is in a position to enjoy the advantages and benefits, if it so wishes, as a licensee.

Mr. COX. The right reserved to the affiliate to reject, however, is not just that he doesn't think this is the most in the public interest, but that he thinks it is affirmatively contrary to the public interest, or that there is some peculiar local occasion which he feels requires the displacement of the program. Wouldn't that be a better description of the extent to which he can reject programs in option time?

Mr. JAHNCKE. I don't think that any stations have ever been reluctant to eliminate any program, network or local, for a program that, in its opinion, is more in the public interest.

Senator PASTORE. Let's get these things in their proper perspective. What you are actually saying, Mr. Jahncke, is this, that this "must buy" aspect of this situation affects relationship between the network and the advertiser insofar as it regulates the amount of money that the advertiser has to pay and the quality of the program that you can put on the air, as to the distribution you can make of that program?

Mr. JAHNCKE. Well, Senator Pastore, I think that you do have economics coming in here.

Senator PASTORE. That is what I mean.

Mr. JAHNCKE. In that the number of outlets needed to justify the cost of a program—the number of outlets which, may I hasten to point out, practically every advertiser wants, because he needs a distribution—all are factors in this situation, but I would like also to point out that we are discussing "must buy," which is a practice that doesn't obtain on ABC. I feel perhaps I should retreat from this discussion.

One last comment on Mr. Moore's testimony. On page 39 he speaks about the Lawrence Welk Show, which we are very happy to have the privilege of broadcasting in the public interest, and he says he regrets the public was deprived of the opportunity to hear and see this program because of network reluctance to schedule it. We are happy to schedule it, and I only regret that the public is still deprived in a great many places of the privilege of seeing the Lawrence Welk Show because we do not have access to quite a few markets for that program, which even Mr. Moore admits is completely in the public interest.

If I may return to my prepared statement——

Senator POTTER. What percentage of your class A option time do you program? I mean, what percentage of a class A time on your affiliate stations do you provide?

Mr. JAHNCKE. We——

Senator POTTER. I notice the percentage in Mr. Moore's statement of the four networks. I was wondering if your network was using up all of its option time.

Mr. JAHNCKE. No, sir, we are not using all of the option time. I think class A time is limited to those 3 hours that are optioned by law to the network. There is nothing illegal about network option time. Both the FCC and Justice Department, as I understand it, have ruled this is a perfectly legal arrangement. May I say I think we are innocent until proved guilty in this respect. Of the 3 hours that are optioned to us, we are not using all of them. Perhaps we could use more, if we were able to compete more totally with the other two networks—and by "compete" I mean have access to the market place. For example, Senator Pastore, we do not have access to Providence, R. I., and Mr. Chairman, we do not have access, or at least equal access, to places like Lansing, Grand Rapids, or Kalamazoo, Mich. We do compete, for example, in the Detroit area.

Mr. Cox. Of the programing which you do provide in option time between 7:30 and 10:30 or 7 and 10 in the evening, what percentage of that programing is normally cleared for you by the ordinary affiliate?

Mr. JAHNCKE. I do not like to identify any affiliate as ordinary. We love them all. We only regret we do not have enough of them. [Laughter.]

Mr. Cox. By a typical affiliate—or aren't they typical, either?

Mr. JAHNCHE. Our clearance on affiliates where we have full access to the market place is good, and comparable to the other two networks. I think it is good only because we program in the public interest.

Mr. Cox. Do you think that you would clear as high a percentage of that program time if your affiliate had the option to replace the program you offer with one from another source which he happened to think was better?

Mr. JAHNCKE. I do not quite follow that, sir.

Mr. Cox. That is, suppose that instead of having a clause in your agreement which says that you can, subject to very minor restrictions, require the affiliate to accept the programing you offer during option time, you didn't have that; do you think that there is a real possibility that some of your affiliates might find programs from other sources which they thought would attract more viewers and would be more in the public interest—not as a general rule, but as against certain programs which you offer?

Mr. JAHNCKE. Any program schedule is an average of its best and its worst. Perhaps it is reasonable to assume that any one person might be able to develop a program better than the worst of a given list of programs, but I think we get back, basically, to allocations here. We are talking about the fact that we only use 6 hours a day, or only have 6 hours a day option in the practical area, afternoon and evening. This is far from 90 percent of the station's time. I mean, after all, most stations are on the air from 8 in the morning until midnight. It is against this projection of 16 hours that maybe we should talk about 6 hours, or even 9 hours. It is not that great a percentage of the station's time.

Mr. Cox. We will reserve other questions. You may go on to your statement now.

Mr. JAHNCKE. My statement today supplements the statement which I made on behalf of ABC 2 years ago before the Communications Subcommittee of this committee under the chairmanship of Senator Potter, which at that time was considering the status of UHF stations.

ABC then warned of the dire fate of UHF television if corrective action was not taken immediately by that committee and the FCC. I regret that the record of the past 2 years shows that we were accurate prophets.

I cannot overemphasize the importance of immediate positive action by your committee in shaping the future course of this country's most dynamic industry.

Television broadcasting faces an existing and future shortage of stations which prevents effective competition today and forecloses significant improvement in the future.

In addition to the scarcity of television stations, inherent defects in the existing allocation plan, principally the intermixture of UHF and VHF, preclude effective use of all available channels. Unless changes are made quickly UHF will disappear and television will be limited to only 12 VHF channels. These have always been recognized as grossly inadequate for a nationwide competitive system.

ABC has participated in each television allocation proceeding and has sought an allocation framework which would permit a truly competitive system. We looked forward to the lifting of the freeze—that was 1952—and the opening up of the UHF band. We hoped that the availability of additional channels in this band would enable us to attain equality of access to television outlets. But first the backlog of competitive applications bogged the Commission processes and prolonged the scarcity of outlets in major markets. Now the failure of UHF in intermixed markets threatens to make the scarcity permanent.

As the third network striving to reach equality with CBS and NBC, ABC has been the victim of this unnatural and unnecessary shortage of television outlets. With many of the most important markets of the country limited to one or two stations, ABC has been unable to obtain a national audience for all its programs and the public has been deprived of the freedom of choice of at least three program services.

Although ABC stands to gain a great deal by achieving competitive equality the real beneficiaries will be the public who in many areas cannot see outstanding ABC programs, for example, Disneyland, Voice of Firestone, John Daly, Danny Thomas, Bishop Sheen, Lawrence Welk, and many others.

ABC is itself the result of congressional mandate to the FCC to foster competition. The predecessor company of ABC, the Blue Network, was originally established by NBC to provide its radio listeners with a diversity of program selection. In 1941 the FCC in its Report on Chain Broadcasting found that it was contrary to the public interest for NBC to own both the Red and the Blue Networks and ordered that one be sold. The Commission in its order approving the sale of the Blue Network to ABC expressed the hope that the sale would mean a much fuller measure of competition among the radio networks.

Unfortunately the degree of competition envisioned by the FCC in radio has been severely hampered by the fact that almost all the key clear-channel stations are affiliated with CBS and NBC. The question of how to make the most efficient use of these clear-channel stations was the subject of extensive hearings commenced by the FCC in 1945, 11 years ago. The FCC has not yet rendered a decision in that proceeding. Will the same restrictive pattern of inaction, indecision, and delay for a decade be repeated in television?

The competitive advantage enjoyed by NBC and CBS in radio as a result of their preponderance of clear-channel affiliates has been extended to television. Most of the operators of these clear-channel stations are today the owners and operators of the VHF television stations located in monopoly and duopoly markets.

The competitive handicap under which we operate in radio is far less severe than that in television. In radio we have been able to obtain affiliates in all important markets even though their coverage is more restricted than that of the NBC and CBS stations. In television, however, there are 39 of the top 100 markets, including Boston and Pittsburgh, where monopoly conditions do not permit us to have an affiliate at all.

It is undeniably true that our inability to compete with the other two networks in radio and during the early days of television was in some measure due to our lack of capital with which to develop programing. That problem, however, was solved by our merger in February 1953, with United Paramount Theatres, Inc., to form our present corporation, American Broadcasting-Paramount Theatres, Inc.

It is our firm conviction that the major problems facing the television industry are the lack of at least three competitive facilities in the major markets and the preservation of UHF television.

The solution of both of these closely interrelated problems is essential to the development of a truly national, fully competitive television system—the opening up of the present monopoly and duopoly markets to free competition.

We had hoped that the sixth report and order of the FCC would solve our problem of competitive access to these monopoly markets. Experience has proven conclusively, however, that a UHF television station cannot compete against multiple VHF competition even when the UHF station is in the market first and a high rate of conversion exists. This is an indisputable fact, which must be used as the starting point for the correction of the inadequacies of the present allocations system.

I therefore take exception to that portion of the FCC's testimony before this committee in which UHF stations in West Palm Beach, Tampa-St. Petersburg, Wichita and Sacramento are cited as exceptions to the maxim that UHF stations are unable to survive against multiple VHF competition.

In the case of West Palm Beach, less than a month after the FCC testimony was given, WIRK-TV, the UHF station, discontinued operations.

In Wichita, UHF station KEDD commenced operations on August 15, 1953, as the NBC affiliate. At approximately the same time a VHF station also commenced operation in the market. Within 1 year there were 124,000 VHF homes as compared to 74,000 UHF homes.

By the end of a 2-year period this disparity had grown to 222,000 VHF homes as compared to 126,000 UHF homes. Subsequently, two other VHF stations also commenced operation in this market. Recognizing the desperateness of its competitive situation, KEDD petitioned the Commission on February 2, 1955, to deintermix the Wichita market by assigning another VHF channel in place of the UHF channel. The petition was denied. I understood effective May 1, 1956, KEDD will lose its NBC affiliation to a VHF station. The rest of the story you can guess.[1]

Senator PASTORE. At that point, do you take the position that it was feasible to give KEDD a VHF station?

Mr. JAHNCKE. I do not know from an engineering point of view whether a VHF channel was available under any existing set of engineering standards, but I take the position that at this point it is hopeless to expect a UHF station to try to survive against three VHF signals in that market.

Mr. Cox. I would suppose it fair to assume that if a formal petition for deintermixture was filed there must have been engineering support for the proposition that at least a reduced-coverage V could be dropped into that market, which at least would get around this conversion problem.

Mr. JAHNCKE. I am not familiar with their application. I do not know the engineering aspect.

Mr. Cox. Mr. McKenna, do you have some knowledge of that?

Mr. McKENNA. I am advised, Mr. Cox, that the petition contained with it an engineering statement showing how an additional VHF station could be assigned to the area.

Mr. JAHNCKE. In Sacramento, Calif., UHF station KCCC-TV was on the air for almost a year and a half before the two VHF stations started. Prior to that time KCCC-TV operated at a profit. It now operates at a loss. It has applied to the FCC for a VHF channel as the only means of survival. This is not intermixed prosperity, as was suggested by the FCC.

The story in Tampa-St. Petersburg is tragically similar. WSUN-TV, the UHF station in this market, was on the air for 2 years before the 2 VHF stations commenced operation. I was advised by the manager of this station last week that its overall time sales now show a 42.5-percent decrease.

I have discussed these specific cases for two reasons. First, I think they prove ABC's contention that UHF cannot prosper against multiple VHF competition. Second, the fact that these markets were selected by the FCC to illustrate UHF's ability to compete with multiple VHF stations suggests a lack of knowledge of the problem or an unwillingness to face facts.

In view of the desperate urgency of the allocations problem, we do not feel that this committee or the FCC should allow itself to be sidetracked from the central allocation issue by such subsidiary matters as tower heights, boosters, translators, satellites, power increases, etc. While these proposals all have undeniable merit, they are of value only if the UHF station is in a market in which it can survive from an allocation point of view in the first place.

The matter of the high cost of A. T. & T. television transmission facilities has also been raised. There is no doubt that the extremely high cost of this service limits the ability of many stations to receive live network program service.

ABC's television line charges are now over $6 million a year. We are in no position to know if this is too high. However, I would like to point out that the A. T. & T. is a common-carrier monopoly which

[1] EDITORIAL NOTE: KEDD left the air in April 1956.

comes under the regulation of the FCC. The tariffs governing the charges for television lines were filed with the FCC in 1948. We agree that it is time that the FCC determined the fairness of these charges.

Mr. Cox. Are you yet in a position, Mr' Jahncke, to take advantage of the A. T. & T. tariffs for a minimum 8-hour usage per day? That is, these bulk rates which apparently prevail as far as NBC and CBS are concerned?

Mr. Jahncke. We are in a much better position than we were 2 years ago, and in some cases we are using more than 8 hours a day. I think it is of interest that the basic service only provides an 8-hour distribution system. Already all 3 networks have requirements above 8 hours a day on the average and, therefore, normal operations automatically put you in an excess or premium bracket as far as tariffs are concerned. We are all paying overtime for normal operations, as contrasted with radio broadcast tariff, which provides 16 hours of service for the base rate; television transmission facilities only provide for 8 hours and you pay overtime above that.

Mr. Cox. As I recall your testimony 2 years ago, you indicated that your rates were proportionately higher for the amount of cable service you got than those of the other two networks. Does that continue to be true, even though to a lesser degree?

Mr. Jahncke. It continues to be true, but to a lesser degree. Let's put it this way: Because of a smaller use, our purchase relatively is less efficient, although we all operate under the same tariff.

With respect to subscription television, which has also been mentioned, we do not believe that it will provide an answer to the UHF problem. Certainly the creation of a competitive, free television service should take precedence over any pay television device. We are pleased to read that this was also the position of Chairman McConnaughey of the FCC in his testimony before this committee.

We do not believe that positive action on television allocations should await the conclusion of the present FCC network study which, according to the estimate of Chairman McConnaughey, will not be completed until sometime in 1957. I might point out that the last study of networks took over 3 years to complete and so perhaps even the 1957 date might be optimistic.

This committee should consider interim regulation of VHF stations in monopoly and duopoly markets by a variation of the plan suggested by Dr. DuMont in the Potter hearings 2 years ago. This would require VHF stations in a market where there are less than 3 competitive outlets to share their service equally and equitably among the 3 networks.

Mr. Cox. How would you do it?

Mr. Jahncke. The suggestion has been made there is an undue amount of control among the three networks. I suggest there is an even greater undue control in a market such as Providence where there are only 2 stations, and 2 managers determine everything that is available for the citizens of that community.

Senator Pastore. Have you any suggestion as to how it should be regulated?

Mr. Jahncke. I certainly think the regulation should be one in effect only until the basic end of sufficient facilities is available. I think it should operate to provide positive entry rather than operate as an additional barrier to an additional program service common to the market. We have places where Disneyland is not available. I submit that, by any program standard, that program is in the public interest, regardless of what time of day it is broadcast, and if we cannot get into a market with that program, this is the operation of monopoly and duepoly against the public interest. These operators—I am not suggesting that they connive to create or perpetuate monopoly. They enjoy the benefits at the moment, which have gone on too long. We would prefer to have our own station in Providence.

Senator PASTORE. The point I am getting at is this. Of course it is easy to make a platitudinous statement, but to give us a specific cure for it is another problem entirely. Are you suggesting that the Federal Communications Commission be given the authority to evaluate the quality of the program, to determine whether or not it should come in?

Mr. JAHNCKE. No, sir. I disagree completely with the concept of Senator Bricker, for example, that broadcasting is a public utility. I disagree completely with the concept that there should be any governmental control over program content as abridgement of free speech and censorship. I say this: I think if a network such as NBC broadcasts a program from coast to coast and it is broadcast by its affiliates around the country, it is fair to say that that program is in the public interest, and therefore, without the FCC entering into the dangerous area of judging program content, it can accept and assume that the broadcast of that program is not against the public interest, and therefore, in the public interest.

Senator PASTORE. That is all right. I follow you.

Mr. JAHNCKE. Therefore, may I suggest this possibility: A regulation limited only to the areas where there is a scarcity—let's take Providence, where there are 2 stations—by which each of the 2 stations would be required to make available 1 hour, for example, of their prime time to a third program service. This would not give the third program service parity. It would give it some reasonable representation in the market. If you just used that example in the evening hours, where a station lawfully grants a 3-hour network option time period, if 1 of those 3 hours were made available to a third program service, the primary network would still have a 2 to 1 advantage. Therefore, I am not talking about parity, I am talking about just a reasonable representation until the basic problem is solved.

Mr. COX. Is it your position that the FCC now has authority, in its regulation of the contracts its licensees enter into with networks, to impose such an overall time limitation in those areas where there are not available three fully competitive facilities, and that they could do that under this present existing authority?

Mr. JAHNCKE. Mr. Cox, I think they can, but as a practical matter, I think that if there is merit to the suggestion, they will, most probably, if they receive a suggestion, mandate or directive from this committee so to do.

Senator POTTER. I recall Dr. Du Mont's proposal that in a 1- or 2-market community—at that time there were 4 networks—that they allow the networks who have no affiliation to have 25 percent of the time on the other station. Is that what you are making reference to?

Mr. JAHNCKE. Yes, sir; only I am making reference to a positive suggestion that when a program is broadcast coast to coast, by licensees, each of whom in their individual communities has the responsibility to broadcast in the public interest—if they schedule these programs, that is evidence enough that the program is in the public interest, and, therefore, the FCC does not have to concern itself as to whether, if such a station in a duopoly or monopoly market schedules it, it would be control of program.

Senator POTTER. Let me ask you this: Assuming that I have a station in a one-station community. I have an NBC or CBS affiliation. I wanted to show Disneyland. Could I, as a manager of a station, secure Disneyland from you to show on that station?

Mr. JAHNCKE. Senator, we have spent the last 8 years trying to persuade stations in 1- or 2-station markets to carry our programs. To give you an idea——

Senator POTTER. Some do it, don't they?

Mr. JAHNCKE. Certainly some do, fortunately, sir. That is perhaps why we are still in business. Over the whole country, if you will just take, let's say, the top hundred markets, as an example—this is not the whole country, but it is the heart of it—the degree to which NBC and CBS can obtain live clearance normally is in the order of around 85–90 percent. Our figure would be about 55 to 60 percent compared to that. This is access to the marketplace. This is not whether our programs rate higher or lower than any other person's programs. This is physical access. This is places where, as in Lansing or Grand Rapids, or Providence, we do not have an affiliate.

Senator PASTORE. How do you show your programs in Providence? Disneyland does show in Providence. Please explain that.

Mr. JAHNCKE. In addition to their NBC schedule, the NBC station, I think it is, Senator Pastore, schedules Disneyland around its NBC schedule.

Senator PASTORE. In other words, that shows in Providence not through any agreement with you?

Mr. JAHNCKE. There is an agreement; yes, sir.

Senator PASTORE. But through the NBC station?

Mr. JAHNCKE. No, sir. The NBC station has a secondary, subsidiary arrangement with us to carry our programs in addition to their basic arrangement with NBC.

Senator PASTORE. If they are tied up with NBC, where do they get the latitude to make an agreement with you? That is what isn't clear in my mind.

Mr. JAHNCKE. Senator, the network option time rules provide that a station is permitted to grant no more than 3 hours in any segment of the broadcast day to a network, but there is no prohibition on a station from taking more than 3 hours if they consider the programing in the public interest. That is why, in addition to 3 hours, some stations take more than one network. In addition, there is nothing to prevent a station from having an affiliation with more than one network; for example, in the case of Providence, this NBC arrangement, they have a secondary arrangement with ABC and take some of our programs. In effect, we are in a position where we peddle our programs in Providence, we try to get——

Senator PASTORE. If I may follow this through, please, because this it quite important to me. I want to understand this. You say on page 7:

> This would require VHF stations in a market where there are less than 3 competitive outlets, to share their services equally among the 3 networks.

Now, if what you say here is true, then how do you reconcile it with this fact that you can negotiate with the third station as you have already suggested?

Mr. JAHNCKE. I do not negotiate, sir, with the third station. I negotiate with 1 of the 2 existing stations. I do not negotiate equally with the other two networks.

Senator PASTORE. When I say "they," I mean the two existing stations in Providence can negotiate with you as to the showing of a special program that they would like to show in the public interest.

Mr. JAHNCKE. That is almost what we usually refer to as a per program arrangement, which is something less than a full affiliation, sir. I do not have the same opportunity, nor do I negotiate with these stations, nor have the same prospect of getting my programs scheduled, particularly at the correct time, as do the other two networks. I frankly do not know when the Disneyland program is broadcast in Providence, but I know it is not at the scheduled time of 7:30 to 8:30, Wednesday evenings. I know that is true.

Senator PASTORE. No. It shows on Sunday afternoon.

Mr. COX. It is not in option time then; is it?

Mr. JAHNCKE. It is either not in option time or else it is in some option time that the station is not giving to NBC. It is assuming not an equal access to the market place.

Senator POTTER. Would you comment on the statement made by Mr. Moore? If it is all right for you as a network to go into a two-channel market to sell programs, why isn't it equally justifiable for an independent producer to go into that market?

Mr. JAHNCKE. Nothing prevents the independent producer right now, Mr. Chairman.

Mr. COX. Except the option?

Mr. JAHNCKE. I do not have any option time in Providence and I still get Disneyland in there. I go in with the Disneyland program and a sponsor and I would say, "Would you carry the program, I would like it carried at 7:30 Wednesday." I end up on Sunday afternoon, with the best hour I can do. Any packager that wants to go in and say he has one of these high-rated blood and thunder shows that Mr. Moore cited, and has got a sponsor for it, and if the station wants to carry it on Sunday afternoon, there is nothing to prevent the station from doing it, either.

Senator PASTORE. But it is a rebroadcast?

Mr. JAHNCKE. Yes, a delayed proposition.

Senator PASTORE. I think you have explained that to my satisfaction.

Mr. JAHNCKE. We have programs such as Voice of Firestone, John Daly, news, coverage of conventions, and a lot of programs which, by their nature, have to be broadcast live or not at all; as to which we are automatically denied access to the market.

Senator PASTORE. There is another point I would like to clear up now. Let's assume your suggestion, as you have illustrated it on page 7, were carried out. How does that affect the relationship between the network and the advertiser as to the quality of the program and the amount of money it might cost? Will that impede it in any way? I think in the beginning of your statement you said that fundamentally you could not do too much along the line of dictating how many distribution points you should have because that is a contractual relationship between the network and the advertiser. In other words, in dealing for a particular program, it it vitally important to the advertiser how many outlets he is going to have.

Mr. JAHNCKE. As a practical matter, sir, rather than the advertiser being put upon and forced to buy something like 50 markets, I think the facts would prove that the advertiser, in practically all cases, wants to buy many more than that minimum because the advertiser has a national advertising job to do, and this automatically means he needs many more than 50 stations.

Senator PASTORE. Your plan would bring more advertisers into the field and into these facilities?

Mr. JAHNCKE. No, sir. I am not suggesting this as a basic solution. The basic solution is to move channel 3 to Providence in my opinion.

Senator PASTORE. Everybody knows Pastore is from Providence. [Laughter.]

Mr. JAHNCKE. If I may, Senator, for this one afternoon may I say that is ABC's problem, not yours, because we feel equally strongly about it.

Mr. COX. Do I understand your position on this two station market situation to be that, if a proposal such as Dr. Du Mont suggested were effectuated, instead of having to deal hat in hand with a station that is basically affiliated with one of your competing networks, you would then have, under FCC regulations, the opportunity to place your programs, at least to the extent of one-third of their prime time, onto each of those two stations?

Mr. JAHNCKE. That is correct, sir. Let me hasten to say, I just want to deal with them hat in hand or otherwise. I just want to deal with them.

We opposed proposals of this kind during the Potter hearings, principally because we thought that these monopoly and duopoly markets would be eliminated by reallocation to permit free competition. However, experience of the past 2 years has convinced us that this plan, whatever its drawbacks, would be a preferable alternative to further inaction.

Regulation of this type, however, does not go to the heart of the problem. Broad reallocation is essential.

The FCC has recently reaffirmed, in the current reallocation proceedings (Docket 11532) the objectives of its 1952 Sixth Report and Order as follows:—(1) at least one service to all areas; (2) at least one station in the largest possible number of communities; (3) multiple services in as many communities as possible to provide program choice and to facilitate competition. Since priorities 1 and 2 have, on the whole, been achieved, ABC believes that the FCC should now make priority No. 3 its first order of business.

Therefore, the objective of providing multiple service should be handled first. The real deterrent to the development of a nationwide competitive system is the lack of at least three comparable television facilities in the major markets. Unless this is corrected, the economy of scarcity will continue and television broadcasting will fall far short of realizing its full potential. Equally serious is that the industry wil be confronted with a virtual monopoly which will inevitably result in rate and other regulations.

The interrelation between the existence of three or more competitive program services and the survival of UHF television has become abundantly clear. A UHF station cannot survive without attractive programing. At the present time national networks are the primary source of this programing. Since national advertisers are interested in their programs' receiving the widest possible circulation, they are reluctant, and in many cases unwilling, to have their programs on a noncompetitive UHF station.

Clearly, therefore, the public interest requires immediate reallocations. This has not been done. Administrative delay by the FCC, which is an arm of Congress and the responsibility of this committee, has prevented the solution of the allocation problems in the time which has elapsed since the Potter hearings.

Even where no reallocation is involved the industry has been the victim of FCC delay. To illustrate what I mean, final decisions have not yet been reached in Seattle, the 21st market; Miami, the 22d market; Norfolk, the 50th market; Omaha, the 51st market; or Jacksonville, the 60th market. Oral argument has not yet been had in the competitive hearings pending for Boston, the 6th market; St. Louis, the 11th market; Buffalo, the 14th market; Indianapolis, the 25th market; New Orleans, the 28th market; or San Antonio, the 43d market. Initial decisions have not as yet been reached in Pittsburgh, the 8th market, or Toledo, the 45th market. Some of the applications have been pending for 8 years.

Mr. JAHNCKE. There is a partial answer to Mr. Moore. All of these stations, if they ever commence operations, will be looking for programing that film syndicators can provide in addition to networks. There is only one solution and that is to overcome the scarcity of stations. As long as you have 1- or 2-station markets around the country, how can any film packager expect them to need the same amount of program service as is necessary to supply the needs of a market like Los Angeles, which has seven stations that have to be programed? The mathematics of it are simple.

Senator PASTORE. On that point, Mr. Jahncke, are you familiar with the background of these pending cases? Would you say the delays are due to the people involved, or does the fault lie with the cumbersome machinery of hearings that we have?

Mr. JAHNCKE. Both, sir, in my opinion. Certainly, there is a limit to the expediting that the FCC can do, because of their basic administrative process, but certainly there is fault if you don't start hearing a case until 6 years after the application has been submitted to the FCC. I submit that is rather undue delay.

Senator PASTORE. Where did that happen—hearings started 6 years after the application was put in?

Mr. JAHNCKE. We have applications still pending. Some of them have been pending over 8 years.

Senator PASTORE. That has been a matter of no little concern to the members of this committee. We have been very much concerned with that situation, but we are told continuously by the members of the Commission that it is not their fault—it is because of the machinery and the procedures that they are subjected to in holding their hearings and having these matters decided by the courts.

Mr. JAHNCKE. Certainly there is a great——

Senator PASTORE. We agree, it is a matter of concern to us as well as to you.

Mr. JAHNCKE. It is a question of the amount of speeding up that can go on at any given point. I would say, certainly, that to set up a system of priorities that leaves important markets such as Boston to the end of the processing line might be criticized. I suggest that when an initial decision is made and it takes over 12 months before a final decision is rendered, perhaps that is an awful long time for any administrative process to take place.

Mr. COX. These are all cases in which no court intervention has been involved, to the best of your knowledge?

Mr. JAHNCKE. Sir?

Mr. COX. These are all instances in which they have not become involved in courts?

Mr. JAHNCKE. These are all instances of contested applications that haven't reached the courts, because they haven't been decided by the FCC.

Mr. COX. They are cases, with the exception of the Seattle case, in which the record has been closed—and in that case it was closed and then reopened?

Mr. JAHNCKE. I am not sure whether all the records have been closed.

Mr. MCKENNA. I believe that is correct, Mr. Cox.

Mr. JAHNCKE. The FCC, in its testimony before this committee, pointed with pride to the fact that during the year 1955 the Commission had granted 53 construction permits for new television stations. Of these 13 were UHF stations, 3 were educational VHF stations, 2 were satellites, and 5 of the grants were located in Alaska, Puerto Rico, or Hawaii. Only 10 of the 53 grants were commercial VHF grants in the top 100 markets. In every instance but one, the applications for these VHF grants were filed between 1948 and 1952. Thirteen of the fifty-three grants were in markets below the top 300 markets, and in several cases the markets were so small they were not even classified.

I might observe that of this record, only 15 of these cases were contested at all in the first place. The rest were merely a question of the applicant qualifying and receiving an uncontested grant.

The FCC has coupled its inaction in the matter of granting additional VHF stations in monopoly and duopoly VHF markets with its denial of deintermixture in UHF markets. The only affirmative action which the Commission has taken on the allocations problem during the past 2 years will, if not reversed immediately, relegate UHF to an inferior position in such markets as Hartford, Peoria, Evansville, Albany, and Madison, if it survives at all.

Mr. COX. Does that mean you would favor deintermixture in those areas to make those all UHF markets?

Mr. JAHNCKE. I would like to describe it in this way if I may, Mr. Cox. I think that the full utilization of UHF is absolutely essential if we are going to develop a truly competitive, truly national TV system. Now, we have got a situation here where they don't have to describe the UHF problem any more. We all know it by heart. I think what we have to do is consider it like an infant industry that needs a protective tariff around it. You have got to stop hurting it, you have got to give it some special protection just like you do for other industries, and permit it to grow and develop until it can be cast off on its own.

After all, this isn't unique in American history. Newspapers and magazines today enjoy a mail subsidy that amounts to millions of dollars, even after they mature.

Senator POTTER. We probably wouldn't have had the airlines if they hadn't had a subsidy.

Mr. JAHNCKE. That is right.

You have got to, it seems to me, stop killing the patient. You have got to put it through a period of convalescence and you have got to—even this isn't enough, you have got to ultimately work out some arrangement whereby you can look forward to the day, however distant, when every receiver in this system will be an all-channel tuner.

It is no good to check UHF during a holding period if you are not pointing to an ultimate full solution. If you don't get an ultimate full solution you will always have this economy of scarcity and you will always have the problems Mr. Moore suggested. You will have the problem of access to the market place and you will have the atmosphere, if you will, under which perhaps much more regulation will be needed than should be needed, and will be necessary, if the full potential of free television is permitted to grow.

Mr. COX. Would you say this: That if there is any validity to the concept of developing markets which are all UHF, that these five areas would represent as likely candidates for that as any?

Mr. JAHNCKE. Mr. Cox, I believe that you have got to protect UHF (*a*) in as many markets as possible, and (*b*) in the largest possible markets. No one will say "If you let it grow in X number of cities that is enough; and if you don't—it is only Y cities—that is not enough." It is a matter of degree. The more places where you can permit UHF not only to survive but to grow, the greater your chances of having it take its proper place as a part of a single national television system.

Mr. COX. Would you say the first step to protect UHF in these areas or any others would be to stop making grants of ungranted V channels in these areas?

Mr. JAHNCKE. I would say, Mr. Cox, I think that deintermixture is an inevitable first step. I don't undertsand how you deintermix by intermixing. Certainly, the situation should not be aggravated in these cases. Certainly a stop should be put on all further entry of VHF into these areas, until the basic allocation problem is decided by the FCC.

Senator POTTER. In other words, you can't go in two directions at the same time?

Mr. JAHNCKE. That is correct, sir.

Senator PASTORE. Have you an answer to the contention being made by some of the Commissioners that the spirit of the sixth report and order requires them to continue to intermix and grant as many of these allocations as possible, and that there is a reason for doing it. I am just asking for your comment on this. Their reason for doing it is that unless they allow these VHF's to go into some of these localities—let's take Hartford, for instance—their argument is that unless that VHF station goes in there, there will be certain gray areas that will not be properly serviced. Now, what is the answer to that? I would like someone to comment on that.

Mr. JAHNCKE. Senator, first of all, it is our belief that the gray areas, or the areas to which service would be added, are insignificant. That includes the Connecticut Valley, No. 1.

No. 2, I submit that this problem is of sufficient seriousness that the overall public good must be the consideration, rather than a slavish following of the sixth report which, however well intentioned, is admittedly antiquated today.

Suppose a few people in Connecticut or Rhode Island don't get service for another 6 months. That is a reasonable price to pay to solve this problem, which is very serious and fully national in scope in my opinion. I don't think it is valid at all to suggest that the national problem has to be set aside some 80 more homes in Connecticut—and I speak as a resident of Connecticut, I might add, sir—can get service that presumably is not available to them today.

Senator PASTORE. Are you convinced that unless some solution is found along that line, UHF might very well disappear entirely from the TV scene?

Mr. JAHNCKE. I am, sir. It is merely a question of time. I think the record of the past 2 years shows this. As I recall, the chairman read another letter into the record regarding WTAO–TV, Cambridge. It has gotten to where we are now announcing the burial dates ahead of time. That is the next one to go, leaving the air next week, or the end of this week. It is just bound to happen. It doesn't have to happen. That is the thing that is important.

Senator PASTORE. Do you envision as the ultimate solution to this entire problem that one day we are going to have all-channel sets, 100 percent?

Mr. JAHNCKE. Yes, sir; I do. Senator Pastore, may I use this specific example to illustrate. I think that taking channel 3 from Hartford and putting it in Providence does not take anything away from the State of Connecticut and does not give anything undue to the State of Rhode Island. It solves a problem in one market, Providence, without causing a problem in another market, Hartford. Hartford has a perfectly reasonable TV program service at the moment. The people of Hartford have a choice of three different programs. Why shouldn't the people of Providence have the same privilege?

Senator PASTORE. I like to hear you make that argument, because that is the argument that I have made, too. But of course the argument that they use in refutation of that is this: That there are certain gray areas in Connecticut that can only be serviced by granting that additional VHF station on channel 3 in Connecticut. Your answer to that is that the number of people affected is small, and that they may have to sacrifice for the general good. That is a good argument, depending upon which foot the shoe is on.

Mr. JAHNCKE. It is my understanding, Senator, that first of all, the argument is made based on present UHF signals available. Now, I suggest that any analysis should be based on future UHF signals, or full implementation. Let's assume UHF is given the atmosphere of survival and permitted to grow. Then, if the UHF stations in the Connecticut Valley go to maximum power of at least a megawatt—as is the plan, as I understand, of both NBC and CBS in that area, and I think Mr. Putnam of Springfield testified that he had increased his power and probably will increase it more. I wonder how many people would be left without service if UHF was permitted to realize its full potential in this area, with maximum power and maximum tower height.

Now, I speak from my understanding. If you would like an engineering comment I am sure Mr. Marx can document this thing from an engineering point of view.

Mr. MARX. Well, I don't believe it needs documentation, but to emphasize just a moment: In the first place, there is no UHF station today that is truly using a megawatt. They are doing it by relatively low power transmitters and very high gain antennas, which means that you have a narrow wedge-shaped signal that in many cases passes over certain of the areas you would like to serve.

Secondly, there is no UHF receiver presently available today, or band receiver, that even remotely approaches the sensitivity of the VHF receivers. This, again, is something which will continue unless the facilities are made available to truly allow the UHF stations to operate on their own, so that they are not competing against the V.

Senator PASTORE. I am inclined to agree with you. Once you intermix, I don't see how in the world you will later on be able to deintermix.

Mr. JAHNCKE. There is one way you deintermix later, if I may suggest it, sir—through the death of UHF. That is the way future deintermixture will take place.

Senator PASTORE. You are speaking now of a total demise.

Mr. JAHNCKE. Yes, sir.

Mr. COX. That is, you would be left with only 12 VHF channels for a national system, on the basis of deintermixed VHF service, with a reduction of service and concentration of service.

Mr. JAHNCKE. That is correct.

Mr. MCKENNA. Senator, with respect to the Hartford case, about which you questioned specifically, I am familiar with the engineering evidence that was submitted in that case, and it showed that even with existing powers and heights, that there was no white area in the area that would be deintermixed if channel 3 were moved to Providence. It so happens in the Connecticut Valley you have a large concentration of existing UHF stations, which at the present time provide a grade B or better service to all areas and it was agreed, I recall, by the persons who were opposing the removal of channel 3 from Hartford, that the white-area argument was not available in that particular situation.

Senator PASTORE. It strikes me that that is the only argument that they could reasonably have. Do you agree with that?

Mr. MCKENNA. I agree with that, sir. I agree that even that is not a complete argument in opposition, because, as Mr. Marx pointed out, as UHF power is increased, and as these stations reach their full potential, they will cover these areas.

Senator POTTER. I would like to ask Mr. Marx a question.

We had testimony before this committee by the Chief Engineer of the Federal Communications Commission, Mr. Allen, where he testified that UHF in metropolitan areas just didn't work out; that the buildings served as a means to block the reception.

Now, it is my understanding that UHF could be, with proper power and proper engineering, as effective as the UHF. The testimony that we received from Mr. Allen indicated many problems that would certainly lead you to believe otherwise.

What is your engineering judgment on that?

Mr. MARX. I think I can go back a few years to answer that for you, Senator.

There used to be only low channel VHF stations, going up to channel 6. Among the first few grantees of the high channel stations—before one of the grantees was in Washington, channel 7—one thought very seriously of carrying his grant to the courts in order to force the Commission to give him a low channel VHF station, because channel 7 at that time was believed to be no good—that you could not get the service out of it that you wished to.

ABC took the opposite position in the early days. We believed that channel 7 was one of the better of the VHF channels, starting with channel 2—as a matter of fact, channel 1, when we made that decision.

We have seen nothing to date to prove the contrary. The point is that 7 years ago the reception of channels 7 to 13 was almost an impossible situation in many areas in this country, and certainly in the metropolitan areas. With the improvement of VHF receivers, and the improvement in the power-handling capacities of transmitters and new transmitting antennas, you find that the high channels do an equally good job as the low channels, and in some cases superior. It is my opinion as an engineer that history is going to repeat itself—and let me again state that there has been no UHF station on the air to date that has used a megawatt, or a million watts, in the true sense of using the power.

What he has done is to use 50,000-watt transmitters, and then made up the difference by high gain antennas. Now, what you are doing there is directing your signal, because you are taking the energy and squashing it into a very narrow beam, so that instead of getting the true value of 1 megawatt, you are getting some small portion of it in large areas, and only out here somewhere [indicating] do you feel the impact of it.

Senator POTTER. Do you think that if your UHF were given a healthy climate, the engineering problems would solve themselves?

Mr. MARX. I am convinced of that because we have seen it too often. You couldn't build 50,000-watt transmitters on VHF 10 years ago. No one knew how to do it. You certainly could not get powers in the order of 100,000 watts. A million watts was unthought of—as a matter of fact, unheard of—and you could prove very readily, I think, that you couldn't achieve such powers. We are coming close to it. As a matter of fact, the Commission now has before it a proposal to allow UHF 5 million watts. Yes. Once these things are granted they will be used, providing they can be used in a healthy atmosphere.

Senator POTTER. All right. You continue.

Mr. JAHNCKE. Inaction, however, is not the exclusive province of the FCC. Failure by this committee to take affirmative action and to supply the FCC with guidance is unquestionably a major factor in the present allocation crisis.

Since the Potter committee hearings we have had questionnaires, reports, press releases, studies, postponements, meetings, and the formation of ad hoc committees, whose only conclusion to date has been that a problem exists. ABC's representative on the Bowles ad hoc

Advisory Committee on Allocations resigned last week, giving as his reason the fact that the Committee had held only one meeting since its formation on June 21, 1955—and that meeting was the organization meeting held on June 21—and had "utterly failed to discharge its responsibilities." In short, no progress has been made in the past 2 years and our national television system has been made poorer by the UHF stations which have gone off the air during that period.

Regardless of this negative record, prompt action by Congress and the FCC can still insure a truly national, fully competitive television system and a truly national educational television service.

May I point out that there cannot be any sort of a reasonable educational TV service without the survival and utilization of UHF.

To accomplish this, the FCC must first stop the present deterioration of UHF.

Senator PASTORE. Could I interrupt you at that point, Mr. Jahncke?

I feel very much as you do as to the fact that this thing has been delayed and delayed, and actually we are no better off today than we might have been 2 years ago. There has been inaction throughout, and it strikes me that everyone does recognize the problem, but no one suggests the remedy. The Commission has already taken the position that it must carry out the sixth report and order—I think that is the majority opinion of the Commission.

Mr. JAHNCKE. That is my understanding, sir.

Senator PASTORE. As they have testified here. But now how do you justify—and this is the question that I direct to your attention specifically—under what pretext could the Congress of the United States require, command, or direct an administrative body like the FCC, on an engineering problem, to do thus and so? I mean, what would be the justification for Congress, and how would you, practically, work out that problem?

Mr. JAHNCKE. Well, it seems to me first of all that the FCC is merely an arm of the Congress, to execute its will.

Senator PASTORE. I realize that. Now, we are getting into a reality. The Commission is the administrative agency that determines these technical problems. Now, right, wrong, or indifferent, the problem that has bothered me is: How do you convince the Congress of the United States, in both branches, to take this bull by the horns, on a question that is not a political question—a question which is purely a technical question—and tell the Commission what it should do? I mean, facing the realities of the situation, I wonder if the solution that is being proposed by the many witnesses here—who are all of good intention, and chances are frustrated somewhat because of the attitude of some administrative agency, but I wonder if we are not all overstepping a little bit by suggesting that the Congress decide whether or not there should be intermixture or deintermixture. Is that really a congressional problem?

Mr. JAHNCKE. Senator, I think it is not a technical problem, a technical engineering problem. I think it is a problem of national public interest, and that is the concern and proper area of the Congress. I am not suggesting that the Congress pose as a group of superior engineers. I am suggesting that there is sufficient evidence—and I don't know of anyone who has seriously questioned the logic of deintermixture, with the exception of those who treat the sixth report as a sacred cow, but I don't know of anybody who has seriously questioned the desirability of deintermixture.

I suggest, therefore, that perhaps this is an emergency area. UHF stations are dying. A great future is possibly being jeopardized. Perhaps that is the atmosphere where the Congress can overlook technicalities and take some emergency action, only for a temporary period. This isn't saying that the whole thing is abolished. Just stop, hold everything, until we take a look, and then direct them to take a look promptly, now.

Senator PASTORE. I realize what you say, but the mechanics or the practical realities of every situation, as I have been able to understand it—and I have been here now for a little more than 5 years—usually the recommendations of an administrative body are taken quite seriously by a congressional committee. Now, we have had testimony here from the Commissioners, who have said that they want to see these allocations granted and these assignments made—and then later on they will decide as to whether or not we should have deintermixture. Now, in view of that recommendation, how do we supersede it or overrule it as purely legislative body? That is the thing that is troubling me.

Mr. JAHNCKE. Well, it is my understanding that—or the suggestion has been made that perhaps a Senate resolution, whereas it wouldn't be an automatic order, would be very effective in accomplishing the result.

As I understand, when the suggestion was made for superpower in radio—that is, for stations to go to 750,000 watts—a Senate resolution, which I believe was introduced by Senator Wheeler at that time, had the practical effect of stopping it right now, until a look could be taken. This was not an order to the FCC, but it had the practical effect of——

Senator PASTORE. Was that resolution passed by the Congress?

Mr. JAHNCKE. By the Senate. It had the practical effect of the FCC following the suggestions in the resolution.

Senator PASTORE. But you will admit this. From what you have been able to hear from witnesses that have testified at this hearing, and what you have been able to read, that resolution that you would pass would be tantamount to overruling a decision already made by the Commission. Are we agreed on that?

Mr. JAHNCKE. We are agreed on that, sir. I think the time has come to overrule the Commission.

Senator PASTORE. I just wanted to know your position.

Mr. JAHNCKE. I don't think it would be a lonely ruling, sir. The majority of the industry, even before the sixth report and order was issued, favored deintermixture; and certainly not only a majority, but virtually the entire industry that has testified in the Potter hearings and before this hearing to date, has testified in favor of deintermixture.

Senator PASTORE. For the purposes of the record, you will admit that the Commission has taken a view opposite to the one the industry has taken?

Mr. JAHNCKE. The majority of the Commission; yes, sir.

Mr. COX. I take it your suggestion is limited to a declaration of broad policy on the part of the Senate, not any specific decision as to deintermixture in this area or that area, or how many areas should be deintermixed, or anything of that sort?

Mr. JAHNCKE. My suggestion is that the FCC be directed, through whatever device, not to make the problem worse. Don't put any more VHF stations in any area that is a reasonable area to consider as one of these UHF areas, to be protected while we build.

Senator PASTORE. In essence, what you are saying, Mr. Jahncke, is that the Commission forget for the time being, until this problem is settled, the sixth report and order, and hold everything in suspension until the issue is decided?

Mr. JAHNCKE. To the extent that the sixth report and order does not appear to serve the public interest in this particular area, yes, set it aside. The public interest should always overrule any given report.

Senator PASTORE. Thank you very much. I just wanted your categorical answer on that.

Mr. JAHNCKE. To do this, the FCC must prevent additional VHF stations from going on the air in all areas where deintermixture to create predominantly UHF markets has been proposed. The FCC should continue to do this until such time as it has completed and implemented its present overall television allocations study.

The prime objective of this action is to create an atmosphere of survival for UHF television. This atmosphere would, of necessity, be reflected in increased public interest in UHF, increased advertiser support of UHF, and increased manufacture of all-channel receivers.

The arresting of further deterioration of UHF is the necessary first step. However, this will serve no useful purpose unless the allocation plan ultimately adopted by the FCC provides a framework for a truly national television system. This framework must include strong UHF areas and provide facilities for at least three competitive national program services in each of the major markets.

ABC has proposed to the FCC a plan by which this can be done. This plan is contained in our original petition for reallocation dated October 7, 1955, our comments in the overall allocation proceeding, dated December 15, 1955, and our reply comments dated February 8, 1956, copies of which I would like to submit for the record. The illustrative channel changes which we recommended in our reply comments are set forth in appendix A of this statement.

Senator POTTER. Without objection appendix A will be included in the printed record and the other documents will be retained in the committee's files and incorporated in this record by reference.

(The information is as follows:)

APPENDIX A

SPECIFIC REALLOCATION RECOMMENDATIONS

ABC recommendations for allocation revisions in major markets are hereinafter outlined. These proposals are for markets that are presently capable of supporting more than the number of stations now in operation and where the only obstacle to additional service is the allocations plan. Accordingly, they are limited to those changes which are necessary to achieve competitive three-station service, to avoid destruction of existing UHF stations, and to permit at least some deleted UHF stations to return to the air.

A. Two VHF station markets

The most critical group of markets are those now served by 2 VHF stations, for experience has demonstrated that UHF cannot survive in competition with

2 or more VHF stations. Without adequate competitive outlets for all three networks these markets are denied their full share of network programs. Moreover, the existence of such markets among the first 100, which are important in network operations, weakens ABC and through it, its affiliates, and thus hinders the growth of a competitive television service nationally. In the two VHF-station markets the only possible solution which would not require substantial disturbance of existing services with resulting hardship on the public is to find additional commercial VHF channels. Fortunately this can be done in most of the major markets in this category. A list of these cities with suggested solutions follows:[1]

(*a*) Providence-Pawtucket, R. I. is the 29th market. It has operating VHF stations on channels 10 and 12, and no other VHF channels allocated. A UHF station was in operation, but has been forced off the air. This market could be made competitive by removing ungranted channel 3 from Hartford, thus deintermixing the Connecticut Valley and assigning it to the Providence area.

(*b*) Louisville, Ky., is the 32d market. It has operating VHF stations on channels 3 and 11, and no other VHF channels allocated A UHF station was in operation but has been forced off the air. A second UHF station has been granted but never built. A third competitive service can be provided in Louisville by removing VHF channel 7 from Evansville, Ind., which is now an all-UHF area,[2] and assigning it to Louisville.

(*c*) Rochester, N. Y., is the 36th market. It has operating VHF stations on channels 5 and 10, and no other VHF channels allocated. Four UHF construction permits, including one educational permit, have been granted. None of these stations have been built. The Rochester market could be made competitive by the assignment of channel 13.

(*d*) Dayton, Ohio, is the 41st market. It has operating VHF stations on channels 2 and 7, and no other VHF channels allocated. A UHF station was on the air for a brief period but has closed down. A third service could be provided for Dayton by the assignment of channel 11.

(*e*) Birmingham, Ala., is the 42d market. It has operating commercial VHF stations on channels 6 and 13, and a noncommercial educational station on channel 10. No other VHF channels are allocated. Construction permits for two UHF stations have been granted, but the stations have not been built. A third commercial service could be provided for Birmingham by the assignment of channel 3.

(*f*) Tampa-St. Petersburg, Fla., is the 44th market. It has operating VHF stations on channels 8 and 13. It is also allocated channel 3, which is reserved for educational use, but has not been applied for. A UHF station is on the air on channel 38. Tampa-St. Petersburg could be provided with additional commercial VHF service by releasing channel 3 for commercial use, or by the assignment of channels 5 and 10.

(*g*) Syracuse, N. Y., is the 52d market. It has operating VHF stations on channels 3 and 8, and no other VHF channels allocated. A construction permit has been granted for an educational UHF station, but the station has not been built. Competitive services could be estblished in Syracuse by exchanging channel 8 for channel 7 at Carthage, N. Y. This change would permit the move of channel 9 from Elmira, N. Y., to Syracuse, making Elmira once again an all-UHF market. A second alternative would be to permit the move of channel 6 from Schenectady, N. Y., to Syracuse as part of a plan to make Albany-Schenectady-Troy UHF only.

(*h*) Oklahoma City, Okla., is the 55th market. It has operating commercial VHF stations on channels 4 and 9. Channel 13 is also allocated, but reserved for educational use. A construction permit has been granted on this channel. Two UHF stations have been in operation in Oklahoma City, but both have been forced off the air. This city could be provided with a third commercial service by permitting the move of channel 5 from Enid, Okla., to Oklahoma City.

(*i*) Sacramento, Calif., is the 56th market. It has operating commercial VHF stations on channels 3 and 10. It is also allocated channel 6, which is reserved for educational use. A UHF station is on the air on channel 40. This city could be provided with a third commercial VHF service by releasing channel 6

[1] Since the objective of this solution is to solve the immediate need for a minimum of 3 services in the larger markets, cities with 2 local VHF stations which also receive good quality service from at least 1 nonlocal VHF station have been omitted. Cities with 2 VHF stations which have a third commercial VHF channel awaiting assignment have also been omitted.

[2] A grant was recently made on channel 7, but the station has not yet been constructed.

for commercial use or by permitting the move of channel 13 from Stockton, Calif., to Sacramento.

(*j*) Grand Rapids, Mich., is the 58th market. It now has a single VHF station on channel 8, with no other VHF channels allocated. It should be considered a two-VHF-station market, however, since it receives service from a VHF station on channel 3 at Kalamazoo. A construction permit for a UHF station in Grand Rapids has been granted, but the station has not been built. Grand Rapids could be provided with a third commercial service by removal of ungranted VHF channel 11 from Toledo and its assignment to Grand Rapids.

(*k*) Wheeling, W. Va.-Steubenville, Ohio, is the 75th market. It has operating VHF stations on channels 7 and 9, with no other VHF channels allocated. A UHF construction permit has been granted for Wheeling, but the station has not been built. ABC has been unable to find a satisfactory solution for immediate application in this market.

(*l*) Davenport, Iowa-Rock Island-Moline, Ill., is the 76th market. It has operating VHF stations on channels 4 and 6, with no other VHF channels allocated. A construction permit for a UHF station was granted, but the station was never built and the permit was deleted on November 18, 1953. This market could be made competitive by the addition of ungranted channel 8, which would be removed from Peoria, leaving the latter city UHF only.

(*m*) Duluth, Minn.-Superior, Wis., is the 82d market. It has operating VHF stations on channels 3 and 6. It is also allocated channel 8, which is reserved for educational use, but has not been applied for. A UHF station operated in this market for more than a year, but was forced off the air on July 11, 1954. This market could be made competitive by the release of channel 8 for commercial use, or the assignment of channel 11.

(*n*) Greensboro-High Point, N. C., is the 92d market. It has an operating VHF station on channel 2, with no other VHF channels allocated. It should be considered a two-VHF-station market, however, since it also receives service from the VHF station on channel 12 at Winston-Salem. A UHF construction permit for Greensboro-High Point has been granted, but the station has not been built. A UHF station is in operation at Winston-Salem. This market could be made competitive by the assignment of channels 6 and 8.

(*o*) Brownsville-Harlingen-Weslaco, Tex., is the 93d market. It has operating VHF stations on channels 4 and 5, with no other VHF channels allocated. No construction permits for UHF stations have been granted. This market could be made competitive by the assignment of channels 2 and 10.

(*p*) Shreveport, La., is the 95th market. It has operating VHF stations on channels 3 and 12, with no other VHF channels allocated. No UHF construction permits have been granted. A third service could be provided for this market by permitting the move of channel 9 from Lufkin, Tex., which now operates as a satellite, to Shreveport.

B. One-VHF-station markets

The next most critical group of markets are those which are now served by a single VHF station and which either have no other VHF channels allocated or an insufficient number to satisfy present demand. In many of these markets UHF stations have been able to accomplish substantial UHF conversion, since the programs of at least one network have been available on UHF only. There are three possible solutions to competitive television in these markets: First, not to grant additional VHF stations, leaving the market with its single VHF and multiple VHF services; second, to change the existing VHF service to UHF, so that the market will be UHF only; or, third, to allocate additional VHF channels in place of the UHF channels now in use. A list of markets with the solutions recommended by ABC follows:

(*a*) Miami, Fla., is the 22d market. It has an operating VHF station on channel 4. It is also allocated VHF channels 7 and 10, which are the subject of comparative hearings.[3] VHF channel 2, which is also allocated to Miami, but reserved for educational purposes, has been assigned and is in operation. One UHF station operates in Miami on channel 23. Another UHF station operates on channel 17 in nearby Fort Lauderdale, which must be considered as part of the same market. A second UHF station was in operation at Fort Lauderdale, but left the air December 23, 1954. Since the Miami-Fort Lauderdale area is allocated 3 VHF commercial channels it does not present the same critical problem which is present in those markets with only 2 commercial VHF chan-

[3] A final decision in the channel 7 case was released January 20, 1956.

nels. However, two UHF stations are on the air and substantial UHF conversions have been achieved. The terrain in this area is excellent for UHF propagation. Miami-Fort Lauderdale is one of the few major markets in which UHF has an excellent chance of success, and the establishment of this area as a UHF island would be very beneficial to the future development of UHF nationally. Accordingly, consideration should be given to deintermixture of the Miami-Fort Lauderdale area. The VHF channels removed from Miami-Fort Lauderdale would make possible additional VHF assignments in other Florida cities where UHF has no immediate hope of success.

(b) Hartford-New Britain, Conn., is the 27th market. It has no operating VHF stations, but it must be considered a one-VHF-station market since it receives from the VHF station on channel 8 at New Haven. UHF stations are in operation in both Hartford and New Britain. A construction permit for an educational UHF station at Hartford has been granted, but the station has not been built. VHF channel 3 is allocated to Hartford, and is now the subject of a comparative hearing which is awaiting a final decision. The replacement of channel 3 at Hartford with a UHF channel and the allocation of channel 3 to the Providence area would permit the continuation of a competitive television service in Hartford-New Britain-New Haven, and would also provide a third VHF channel for Providence.

(c) New Orleans is the 28th market. It has an operating VHF station on channel 6. A second VHF channel, channel 4, is now the subject of a comparative hearing awaiting a final decision. New Orleans is also allocated VHF channel 8, which is reserved for educational use. One UHF station has been in operation in New Orleans since October 15, 1953. Construction permits for three other UHF stations have been granted but the stations have not been built. It appears that New Orleans could be provided with three VHF services by releasing channel 8 for commercial use, by assigning channel 11, or by permitting the move of channel 2 from Baton Rouge. However, as noted, a UHF station has been in operation in New Orleans for a considerable period. The terrain in the New Orleans area is eminently suitable for UHF propagation. New Orleans, like Miami, could be made an important UHF island. Accordingly, consideration should be given to the alternative of deintermixing New Orleans.

(d) Albany-Schenectady-Troy, N. Y., is the 30th market. There is an operating VHF station on channel 6 at Schenectady. VHF channel 10 has recently been allocated to Vail Mills, where it would serve the Albany-Schenectady-Troy area, but the effective date of this allocation has been stayed by the court of appeals. One UHF station is in operation at Albany, and a second UHF station was in operation, but left the air January 31, 1955. Two other construction permits for UHF stations have been granted, but the stations have not been built. If the channel 10 Vail Mills allocation becomes effective a third VHF channel could be provided for Albany-Schenectady-Troy by permitting channel 8 to be moved from New Haven, leaving New Haven-Hartford an all-UHF area. An alternative solution is to make Albany-Schenectady-Troy an all-UHF area by deleting channel 10 from Vail Mills and permitting the move of channel 6 from Schenectady to Syracuse. As noted, one UHF station is now on the air in Albany. The second UHF station which is now off the air has stated that it will resume operation if the area is deintermixed. The area also receives UHF service from outside. UHF receiver circulation is high in Albany-Schenectady-Troy, and UHF has made a fair start in this area despite the existence of a prefreeze VHF station on channel 6. This is evidenced by CBS's recent decision to affiliate WROW-TV, channel 41, on a regular basis. Consideration should be given to making this area an important UHF island.

(e) Toledo, Ohio, is the 45th market. It has an operating VHF station on channel 13. Channel 10, which is also allocated to Toledo, is now the subject of a comparative hearing. A construction permit for a UHF station has been granted, but the station has not been built. It has been recommended above that ungranted channel 11 be removed from Toledo and allocated to Grand Rapids, Mich., in order to provide a third competitive service for the latter market. The removal of chanel 10 may also encourage the establishment of UHF stations in Toledo. ABC has been unable to find a complete solution for immediate application in the Toledo market.

(f) Norfolk-Portsmouth, Va., is the 50th market. It has an operating VHF station on channel 3. It is also allocated VHF channel 10, which is now the subject of a comparative hearing. UHF stations are in operation at Norfolk and in the nearby city of Hampton. Competitive television service could be established in this area by the addition of channels 5 and 13.

(g) Jacksonville, Fla., is the 60th market. It has an operating VHF station on channel 4. It is also allocated VHF channels 12 for commercial use and 7 for noncommercial educational use. Channel 12 is now the subject of a comparative hearing awaiting a final decision. An application is pending for channel 7. One UHF station is in operation at Jacksonville, and a construction permit for a second UHF station has been granted, but the station is not yet on the air. Jacksonville could be given competitive television service by the addition of channels 6 and 10. Channel 7 could also be released for commercial use.

(h) Knoxville, Tenn. is the 73d market. It has an operating VHF station on channel 6 and is also allocated VHF channel 10 which is the subject of a comparative hearing in which a final decision was recently released. One UHF station is in operation at Knoxville. Unused educational channed 2 at Sneadville could be moved to Knoxville and released for commercial use, and channel 8 also could be allocated.

(i) Chattanooga, Tenn., is the 83d market. It has an operating VHF station on channel 12. It is also allocated channel 3, which is the subject of a comparative hearing which is awaiting final decision. Two construction permits for UHF stations in Chattanooga have been granted, but neither station has been built. This market can be made competitive by permitting the station on channel 9 at Rome, Ga., to move to Chattanooga.

(j) Bakersfield, Calif., is the 84th market. It has an operating VHF station on channel 10 with no other VHF channels allocated. A UHF station has been in operation at Bakersfield since August 21, 1953. No other UHF construction permits are outstanding. The Bakersfield market could be made competitive by adding channels 8 and 12, deleting the latter from Fresno and replacing it with a UHF channel.[4]

(k) Beaumont-Port Arthur, Tex., is the 90th market. It has an operating VHF station on channel 6. It is also allocated channel 4, which is the subject of a comparative hearing. A UHF station has been in operation in Beaumont since April 9, 1954. This market could be made competitive by the addition of channel 9 if channel 9 is moved from Lufkin, Tex., to Shreveport, La.

(l) Johnstown, Pa., is the 94th market. It has an operating VHF station on channel 6 with no other VHF channels allocated. A UHF station has been in operation at Johnstown since October 15, 1953. The Johnstown market could be made competitive by the addition of channels 3 and 8.

(m) Charlotte, N. C., is the 97th market. It has an operating VHF station on channel 3. It is also allocated channel 9, which is the subject of a comparative hearing, awaiting a final decision. A UHF station was in operation in Charlotte but was forced off the air on March 15, 1955. A third service could be provided for Charlotte by the addition of channel 11.

C. UHF only markets

There is another group of markets—those which at present have UHF stations only, but in which VHF channels are available for grants. In these markets grants on the VHF channels should be withheld pending a final decision in this proceeding. In those instances where grants have been made since the notice of proposed rulemaking in docket No. 11532, the grants should be set aside. The markets in the first 100 which fall in this category are Fresno, the 65th market, and Peoria, the 79th market.

Mr. JAHNCKE. The administrative changes which we recommend are set forth in appendix A to this statement.

The ABC plan is based on a combination of three principles: Deintermixture to create homogeneous UHF or VHF markets; move-ins or drop-ins of additional VHF channels with appropriate engineering safeguards to protect the quality of existing services; and the use of some VHF channels presently assigned to education.

Since these principles were the keystone of our proposals, ABC was shocked by the decision of the FCC in November 1955, denying deintermixture. Pursuant to this decision, the FCC continues to grant additional VHF stations in UHF markets despite the irreparable damage which these grants will do.

[4] A grant was recently made on channel 12 at Fresno but the station has not been constructed.

Under the principles of ABC's proposal, detintermixture could be accomplished in markets such as New Orleans, Albany, Miami, Hartford, Fresno, Peoria, Baton Rouge, Springfield, Ill., to name a few of the more important ones.

The drop-in or move-in of additional VHF channels in accordance with the ABC proposals will enable many monopoly markets to become competitive. For example, additional VHF channels can be assigned to Providence, Louisville, Rochester, Syracuse, Dayton, and Oklahoma City, to mention some of the more important markets which are now restricted to two stations.

Although ABC's plan showed solutions only in the top 100 markets where the core of the problem exists, it is equally applicable to smaller markets. For example, in Louisville, Ky., the 32d market, we have proposed the addition of channel 7, which would be deleted from Evansville, Ind., the 111th market. An additional UHF station would be added in Evansville, making it an all-UHF market. Not only making it an all-UHF market, but maintaining it as a UHF market as of the moment. There is no VHF station in Evansville. It is doing fine. It should be permitted to continue in its present arrangement as an all-UHF area.

The third principle on which ABC's proposal rests is the reallocation to commercial use of some VHF channels now reserved for educational purposes.

In a letter dated December 14, 1955, from Mrs. Kate Hevner Mueller, chairman of the education committee of the American Association of University Women, addressed to the Secretary of the FCC, which has been introduced in this record, Mrs. Mueller states that the "major barrier" to the "development of a nationwide competitive system of television lies not in the continuation of reservations for educational television, but in developing UHF channels—a barrier which limits both educational and commercial television." We are in complete agreement with this statement. However, unlike Mrs. Mueller who is opposed to the use of any reserved VHF educational channels for commercial purposes, we favor such use where it is necessary to make monopoly and duopoly markets competitive.

Examples of monopoly markets which could be made competitive by the use of VHF educational channels are New Orleans, Birmingham, Tampa, Oklahoma City, Sacramento, Jacksonville, Knoxville, and Duluth.

The statement that there are only 10, as I recall, VHF assignments for educational use in the top 20 markets of the country shows conclusively, in my opinion, that there can be no educational system of a national nature without UHF. For example, in New York City, education is assigned a UHF channel. If we can't make UHF work, the largest market in the country will never have educational television. I submit this: That in a great many areas, for understandable reasons, the educational groups are not yet ready to utilize the reservations that have been made for them.

Why not, therefore, permit those VHF channels—which are gathering dust—permit them to be used for commercial purposes, which will further the general overall status of television. This will make an important contribution to the survival and growth of UHF, so that at some future date, when we have a single TV service and there won't be any difference between UHF and VHF, educational TV will be the gainer—if you will lend-lease these VHF channels at this time to commercial TV where they are so urgently and immediately needed, as distinct from the future use of TV.

We don't deny the proper requirement of educational TV, but it is in the future; our urgent need is right now.

Senator POTTER. In other words, it is your statement that the VHF channels that are allocated for educational TV and are not being used, should be opened up for commercial use, with the understanding that when we secure a nationwide television system by the utilization of UHF, there will be channels available for all of our educational needs. Is that the essence of your statement?

Mr. JAHNCKE. That is correct, sir. Not only that, but during the interim I am certain that it would be awfully easy to find someone to operate such a VHF TV station with the agreement and understanding that a reasonable amount of time, as well as facilities be made available to the educators now, when they can't take on the whole job. Let somebody put up and spend all the money. They can still use the money right now. Take New Orleans—I think it is channel 8 that is assigned to education, and the terrain is perfect for UHF. Let channel 8 become a commercial—1 of 3 V's in that market right now.

Mr. COX. Aren't they now building an educational station?

Mr. JAHNCKE. No, sir. It is my understanding they have finally gotten a group together and received contributions from various community groups—including, I believe, the present VHF operators—and have just secured a grant last month.

Mr. COX. They have the construction permit.

Mr. JAHNCKE. The construction permit, I think, was issued in February 1956. Now if that is used, let's say, 5 years from now, when through a replacement of present sets, you have all-channel tuners well underway, it won't make much difference whether you give channel 8 back to the educators and take channel 20, for example, back for commercial use or vice versa. If you, by that time, have got an all-channel system well underway it will be a rather minor problem. Take either one you want.

Mr. COX. If you never get the all-channel set, though, what becomes of educational TV in New Orleans? They are never going to be able to get conversion on educational programs.

Mr. JAHNCKE. What becomes of educational TV—it is just one more area of the failure of a nationwide system, or concept. The same thing will happen as happened in New York City.

Mr. COX. Isn't it true that in each of these typical instances that you have set forth here where you recommend the release of an educational VHF reservation, that you also propose, as an alternative, the drop-in of a V as a possible solution, if that reservation cannot be made available?

Mr. JAHNCKE. I would like to look over the statement. There is the alternative of a move-in or drop-in of a V in New Orleans, in Oklahoma City, I am not sure about Birmingham.

I think at Tampa they drop in channel 10. Channel 3 is the educational in Tampa. I think channel 10 in Tampa would work; in Sacramento they could move in, if they wished to, the present channel 13 on the air assigned to Stockton. Otherwise, it would have to be the use of the educational reservation channel 6, in Sacramento.

In Jacksonville, yes, I think a drop-in would work there. In Knox-ville, which is, may I say, my favorite example, the unused reservatio of channel 2 for Sneedville, Tenn., could be moved to Knoxville. I can only assume it was assigned to Sneedville because it came out righ on the engineering drawing board and because there is an educationa institution there. I also assume that these channels are assigned b the FCC to serve people rather than any other concept.

Senator POTTER. We have an educational channel allocated in m State to a town of about 10,000, and the largest educational institutio is a high school. It is allocated and, of course, not being used.

Mr. JAHNCKE. If there are enough channels left over, there is noth-ing wrong with that, sir. When you are dealing with the pressure o a very scarce national resource, it raises a question. The spectru space in which all television channels operate represents a valuabl natural resource. Unlike mineral or timber resources, however, it nonuse is complete waste and an irretrievable loss.

We have, therefore, suggested to the FCC that the time has com when reservations for educational use should be abolished and re-placed by the system in standard broadcasting, under which there ar no reservations and educational institutions apply on the same statu as all other applicants. If an educational institution, after participa-tion in a competitive hearing, received a television grant, it would hav the right to operate on a commercial basis to the extent deemed neces-sary. This would enable many smaller educational institutions wit limited financial resources to operate a television station.

Furthermore, a cursory glance at the channels reserved for educa-tional use shows that many of them are in very small towns such a Amherst, Mass.; Hanover, N. H.; Oxford, Ohio; and Sneedville, Tenn. because these towns are the locations of educational institutions. I instances such as these the educator's needs would be as well served b campus television and the channels can be reallocated for more efficien use in large markets.

In television today there are too many artificial distinctions based o the frequency upon which a station operates. We have UHF as com-pared with VHF. When television started, we had low band VHF's a compared to high band VHF's. There are proposals now before th Commission which would create low-power VHF stations which woul then be contrasted with high-power VHF stations. There is anothe proposal which would create the classification between horizonta antennas and vertical antennas on the receiving sets.

The ultimate objective of a workable allocation plan should be t eliminate all artificial categories of channels. There should be n more difference between UHF and VHF than there is between 540 an 1600 on the radio dial. From an engineering point of view it is com-pletely practicable.

The objective, therefore, is a compatible television service. On area for corrective action is in the field of excise taxes. All who hav testified on this subject agree that the cost disparity between all-chan-nel receivers and VHF-only receivers should be eliminated by th reduction of excise tax on all-channel television receivers. AB endorses this proposal as we did 2 years ago in the Potter hearings.

In summary, ABC suggests that a congressional mandate be issue to the FCC, either by a memorandum from this committee or by

Senate resolution that the FCC take the following steps to insure a truly national competitive television service:

1. Issue its reallocation plan by June 1, 1956. We were invited on November 10 of last year to submit our suggestions and we were given 35 days to do it, which was ample because we had been studying it for a long time. I suggest that is a reasonable time period for the FCC.

2. Prevent additional VHF stations from going on the air in areas where deintermixture, to create predominantly UHF markets, has been proposed, until the reallocation plan has been issued and implemented.

3. Complete the processing of all pending applications, whose disposition would not be precluded by the foregoing, by September 1, 1956.

In conclusion, I would like to quote from my testimony 2 years ago in the Potter hearings, to you, sir.

> The proposals made above are designed to speed the difficult period of transition during which competitive facilities will become available. When that occurs, ABC will take its competitive chances in the market place of public good will with full confidence in its ability to originate and develop a television service second to none. ABC believes that it has a television-program service comparable in quality to those of its competitors and desires only a fair opportunity to demonstrate that fact.
>
> In conclusion, ABC again desires to point out that it is now an independent network because of the FCC's recognition 13 years ago that the public interest would not be served by concentration of radio stations under the dominance and control of a single network organization.
>
> For reasons unrelated to the merits of its television service, ABC finds itself handicapped due to the lack of competitive television outlets.
>
> The competitive advantages enjoyed by NBC and CBS are basically attributed to denial of fair opportunity for access to the market, rather than to the superiority of their program offerings.
>
> If we can't get our programs into a market, we are not even judged; we are not even in the game.
>
> This committee, therefore, is faced with an extraordinary decision of policy, for determinations reached now in the present period of television development will determine the availability and quality of competitive service in the future.
>
> There may be those who will oppose any remedial action by this committee or by the Federal Communications Commission on the ground that it might deprive those who were first in the field of the fruits of their resourcefulness and labors.
>
> The fruits currently enjoyed in limited-facilities communities are not as much the result of individual initiative or superior ability as they are of VHF channel scarcities and the artificial freeze imposed between 1948 and 1952.
>
> It is one thing to be the first in the field where competitors are free to follow. It is another thing to enjoy a clear field because competitors are enjoined from pursuit.

That was my concluding statement when I testified during the Potter hearings 2 years ago. That is ABC's conclusion today.

Senator POTTER. Mr. Cox?

Mr. COX. Are these drop-in V's that you propose in your suggestion to be fully competitive VHF stations, or are they to operate with limited power, reduced antenna heights, or directional antenna?

Mr. JAHNCKE. As I understand, they would be fully competitive. I would like Mr. Marx to speak to that.

Mr. MARX. It has been proposed in certain of the markets where they are not fully competitive with existing stations, but they do not take advantage of any future engineering developments, such as what might be proved in the use of directional antennas, for example, which would then make them equally competitive.

Mr. Cox. They would, however, provide stations which ABC would find it desirable to affiliate with?

Mr. Marx. They would provide class A service over the city and over the area to be served, but they would not, however, provide the large area of certain existing VHF stations going beyond, for example, protections afforded even within the sixth report.

Mr. Cox. This would materially, however, you feel, improve ABC's chances to develop competitively with the other two networks.

Mr. Marx. It is a question of getting into the market or not getting in at all.

Mr. Cox. In certain of the proposals to this committee it is still suggested that in, I believe, 12 of the top 100 markets the third facility would be a U station in competition with 2 V's. I take it it is your definite opinion that that is not anywhere near a competitive facility, or one which would permit ABC to enter into that market on anything like an equal footing; is that correct?

Mr. Marx. Well, our proposal does not consider a U station in the top 100 markets to be competitive with the V station.

That is true.

Mr. Cox. As I understand it, Mr. Jahncke, your analysis is that there are two primary problems facing the FCC, the industry, and the committee: Those are the provision of a minimum of three competitive facilities in the top markets; and, secondly, the preservation for the long-time growth of television of the UHF part of the spectrum.

Now I think that the proposals that you are making here, and some proposals that others have made, hold out the hope of perhaps achieving the first. Now with respect, however, to guaranteeing any kind of a future for UHF, it seems to me that your proposal boils down to a suggestion for the long-range development of all-channel tuners through the elimination of the excise tax on such receivers, and the deintermixture of certain specified areas.

Do you feel that, first of all, deintermixture can be effected on a wide enough basis to serve as an effective present holding operation for UHF; and that using that as a base, in time, the excise-tax proposal, if adopted alone, would accomplish the long-range result of making all sets able to receive all channels?

Mr. Jahncke. Yes. I believe there has been previous testimony that the turnover of TV sets is approximately 5 years. If that is true, you can project in 5 years, if they started making all-channel tuners now, at 5 years from now you would be over the hump of the problem. You wouldn't have 100 percent, but you would be well on your way. The majority of the sets would be all-channel tuners.

I think that both the excise tax, as well as the establishment of sufficient UHF areas, would be the two incentives to manufacturers to make all-channel tuners.

Mr. Cox. Do you think that some substantial good would be accomplished if the excise tax were eliminated only from all-channel color sets, with the replacement of sets that the advent of color may bring on?

Mr. Jahncke. I certainly think that the time to put out the fire is before it starts. There are 37 million black-and-white sets in this country and, as I understand it, about 50,000 color receivers. Therefore, color isn't here yet. It is several years away. If any arrangement can be made so that as color comes, as it will inevitably, it will arrive only in an all-channel atmosphere, that, like the excise-tax device, would insure that the problem is not perpetuated; but I was very alarmed to read the testimony of Mr. Hoffman here recently, in which he said that although the great bulk of the few color sets that have been produced to date were all-channel receivers, that the projection as a result of a questionnaire he sent out, as I recall, said that only about 11 percent from here out were going to be equipped for all-channel reception, which is discouraging. It means that here we have the classic pattern beginning all over again.

I will admit at the beginning is the time to do it. How you get—how you persuade them to make all-channel receivers for color, I don't know. That is the desirable thing to do. That is the ultimate, last, necessary step to complete the solution, without which the first two steps are useless.

Mr. Cox. And the maintenance in the meanwhile of at least certain areas in which UHF is given reasonable assurance of continued existence is necessary, first, to provide a market for such sets, even without excise tax or other incentives, and, secondly, to promote the development of the better sets and better transmitters, which Mr. Marx was talking about awhile ago. Is that your position?

Mr. Jahncke. Let me give you an example. Take the capital district of New York—Albany. A year ago there were 2 UHF stations and 1 VHF station on the air. One of the UHF's ceased operation. They have testified publicly, if they could be assured that the channel 10 drop-in which the FCC recently approved in Vail Mills, which is in effect the Albany area—if they were sure that wouldn't happen, and, therefore, instead of UHF having to fight multiple VHF competition, if they could receive assurance that the only VHF in the area would be the GE station, channel 6, they would go back to the air. They would take their chances.

I am happy to report that, within the month, ABC has negotiated an affiliation with this station, which will go back on the air—July 1—I think perhaps the first UHF to go back on the air.

Mr. Cox. That is WTRI?

Mr. Jahncke. WTRI. They will be the ABC affiliate in the capital district and they will have 2 UHF stations and 1 V. That is not an easy road for UHF, but in that atmosphere with network support, those 2 UHF stations will survive, but if you permit channel 10, a second VHF signal, to come into that area, they will not.

As far as WTRI going back on the air, if there is going to be a question about channel 10, I understand they will also apply for it, as will everybody else in the area. We say a UHF will survive, these 2 U's against 1 V in a market as large as Albany.

I don't think you can project it down the line to smaller points, but we say there is even a more complete solution for the Albany market. You can make it an all-V market or make it an all-U market. Proposal has been made that, if permissive moves are allowed by the FCC under change of rules, perhaps GE might request to move their channel 6 to Syracuse, which is also in New York, and request a substitution of a UHF channel for their operation in Schenectady. That would make it an all-UHF market, which would be even better, without hurting or penalizing GE for its pioneering in that area. That is another possibility, but it is important, certainly, to create as many areas like Albany where UHF can survive, because only through the maintenance of a lot of UHF areas will the manufacturers be interested in serving the UHF market with receivers and developing them.

Senator POTTER. Mr. Jahncke, what would you do about areas that are already mixed—would it be your recommendation that the Commission should deintermix the mixed markets?

Mr. JAHNCKE. Yes, sir; I think they should.

Senator POTTER. How would that be done?

Mr. JAHNCKE. Whether it is practical or not, I am not sure. You deintermix a market by 1 of 2 processes, sir. You either take the VHF out or take the UHF out. The consideration there is—the problem there is the automatic penalty to the person, say, suppose you have an area where you decide you can eliminate the V. The problem is to take away from a VHF pioneer his dominant channel, his class A position, even if you give him a UHF and take the position that at least he has competitive parity. You have taken something away from him because you have taken away his special advantage he has enjoyed since he has been a V. This is a problem.

Senator POTTER. It has been suggested.

Mr. JAHNCKE. In theory you can argue no one should object just to have an opportunity to compete equally. I can assure you that is all ABC wants. I am speaking about the theory.

Senator POTTER. I know. It has been suggested that there be a time limit involved—say 7 years, maybe longer—to allow a person to convert. If he has a V, to convert to a U, or maybe the other way around if they want to make it a U market and this happens to be a V in that market—allow him a period of time to make the conversion, not so much in the interest of the owner of the station as in the interest of the public who have money invested in sets, to allow them to make replacement of their sets with all-channel tuners. That has been suggested.

Mr. JAHNCKE. It seems reasonable, in any such arrangement, that the present VHF operator be required to put a UHF transmitter on the air promptly, and also he be permitted, as well as required, to operate both UHF and VHF during a period—any period of time is arbitrary. I don't know. It seems to me 7 years is a long time, but there certainly should be that period, and certainly it shouldn't be unreasonable. The VHF station in that community, I am sure, has made enough money in the past 5 years to afford it.

Senator POTTER. I want to thank you for your comprehensive statement and your views. I hope we do not have another 2 years without any improvement in the situation.

Mr. JAHNCKE. I hope this is my last appearance for ABC, sir.

(At this point Senator Potter inserted into the record 37 questions for which Senator Bricker wanted Mr. Moore and Dr. Turner to provide the answers. These questions are set forth in the subsequent volume on network practices in connection with Mr. Moore's testimony.)

Senator POTTER. We will stand in recess until 10 o'clock tomorrow morning, and we will meet in room 457. CBS will be the first witness tomorrow morning.

(Whereupon, at 5:03 p. m., the committee adjourned until 10 a. m., Tuesday, March 27, 1956.)

TELEVISION INQUIRY

(UHF–VHF Allocations Problem)

TUESDAY, MARCH 27, 1956

United States Senate,
Committee on Interstate and Foreign Commerce,
Washington, D. C.

The committee met, pursuant to adjournment, at 10 a. m., in room 457, Senate Office Building, Washington, D. C.

Present: Senators Pastore (presiding), Potter (later presiding).

Senator Pastore. The hearing will come to order.

We have a letter here for the record. It is a letter from Mr. George C. McConnaughey, Chairman of the Federal Communications Commission, dated March 23.

(The letter referred to is as follows:)

Federal Communications Commission,
Washington, D. C., March 23, 1956.

Hon. Warren G. Magnuson,
United States Senate,
Washington, D. C.

Dear Senator Magnuson: This is in reply to your letter of March 16, 1956, enclosing a letter from Mr. Richard S. Salant dated March 7, 1956, relative to my testimony before the Interstate and Foreign Commerce Committee on February 21, 1956, concerning the charges of the telephone companies for intercity television program transmission. Mr. Salant's letter refers to a statement made by me before the committee to the effect that these charges "are very apt to go up." Specifically you inquire as to whether any hearings are scheduled or contemplated with respect to such charges.

My testimony referred to was not intended to mean that the Commission had reached any conclusions as to the reasonableness of the rates of the telephone companies for television program transmission service. In the testimony immediately preceding my statement, certain informal studies of the cost of furnishing television transmission service made by American Telephone & Telegraph Co. were mentioned. The most recent of these studies, which were completed last August and which reflect the situation as of the end of 1954, on its face purports to show that A. T. & T. is earning considerably less return on television transmission service than on its communication services as a whole. Under such circumstances, if the validity of A. T. & T.'s study be assumed, there would be little likelihood of reduced rates. It was this thought that my statement was intended to convey.

The Commission cannot, of course, make any firm conclusions as to the validity of A. T. & T.'s study and the results indicated thereby without a more thorough investigation of that study. Since the completion of the study, the Commission's staff has been engaged in an informal inquiry as to various aspects of the study. It is expected that the results of the staff's inquiry will be submitted to the Commission for its consideration in the near future. Whether or not formal hearings should be instituted will depend to a large degree on the information developed by this inquiry.

With respect to the further statement in my testimony alluded to by Mr. Salant, to the effect that the television industry has made a close study of the rates, I did not intend to convey that the committee of which Mr. Salant is chairman had reached any conclusion as to the propriety of the rates. My statement was only intended to indicate that we were aware that his committee also had this matter under consideration and had met with representatives of A. T. & T. with respect thereto.

Sincerely yours,

GEORGE C. MCCONNAUGHEY, *Chairman.*[1]

Senator PASTORE. Our first witness this morning is Mr. William Lodge, vice president of Columbia Broadcasting System. Mr. Lodge, before you begin, can you give us some kind of an indication as to how long you might be?

Mr. LODGE. Yes; my statement is about 30 pages long and I would judge that would possibly go an hour to an hour and a half.

Senator PASTORE. Then we have Mr. Heffernam, vice president, National Broadcasting Co. Is he in the room?

Mr. ERVIN. He is not here now. I would estimate his statement would take about an hour.

Senator PASTORE. The reason I am asking these questions, we are on the constitutional amendment on limited time today. We start immediately after the morning hour, which might mean around 11 or 11:15. We are too far removed from the Senate Chamber for us to get into a serious hearing here that might be a prolonged one unless we get closer to that Chamber. Many of us, of course, want to hear these debates.

We will proceed with Mr. Lodge. If this is going to take an hour or an hour and a half, and unless Mr.Heffernam is interesting in listening to this hearing, if there isnt anything else to do, we will recess at 12 o'clock. I dislike to have busy people wait around here 3 or 4 hours for their turn. I merely make that suggestion so you will know how the Chair feels.

All right, Mr. Lodge.

STATEMENT OF WILLIAM B. LODGE, VICE PRESIDENT IN CHARGE OF ENGINEERING, CBS TELEVISION DIVISION, COLUMBIA BROADCASTING SYSTEM, INC.; ACCOMPANIED BY RICHARD S. SALANT, VICE PRESIDENT, CBS, INC., AND SIDNEY A. ALEXANDER, CBS ECONOMIC ADVISER

Mr. LODGE. Mr. Chairman and members of the committee, my name is William B. Lodge. Because, as will be seen, many of the issues before you are primarily economic, I have with me today Sidney Alexander, CBS economic adviser. I am vice president in charge of engineering of the CBS television division, the division of the Columbia Broadcasting System which is engaged in television broadcasting—both through operation of four television stations owned by CBS, including a UHF station in Milwaukee, and through operation of a television network. I have bachelor of science and master of science degrees in electrical engineering from Massachusetts Institute of Technology. I am a fellow of the Institute of Radio Engineers and of the Society of Motion Picture and Television Engineers.

Except for a period during World War II, I have been continuously employed by CBS since 1931, and have spent much of that time on

[1] Mr. McConnaughey's testimony referred to in this letter appears at p. 181, pt. I, of these hearings. For Mr. Salant's letter, see p. 805.

problems concerning coverage and frequency allocations. My earlier experience had to do with radio (AM and FM) broadcasting, but since 1946 I have been most concerned with television broadcasting. My work in the past 10 years has included planning nationwide coverage by the CBS television network, determining the service areas of individual television stations, design of transmitting and receiving antennas, and choice of television transmitter locations. I work closely with CBS television audience research specialists and have had an opportunity to compare engineering contours with actual viewing. My experience includes personal investigations of VHF and UHF reception conditions in many parts of the country.

I am here to present the views of CBS concerning the perplexing problem of allocations. I shall try to present these views as simply and briefly as possible. You have before you, and I am submitting for the record, the CBS proposals and comments and our reply comments which have recently been filed by us in the current FCC allocation proceeding (docket No. 11532); these formal documents set out our views in far greater technical detail.[1]

The problem which confronts you and the FCC, as well as the entire television industry, is of extraordinary complexity. It has, quite understandably, given rise to many conflicting views, solutions, claims, and counterclaims. The conflicting proposals and contentions include risks of forcing either of two extreme courses: On the one hand, the course of continued inaction, or, on the other hand, the course of yielding to the tremendous pressures and taking ill-advised action for the sake of doing something.

CBS believes that neither of these courses is inevitable. We believe that action should be taken by the FCC and that the opportunity is presented to improve substantially the present allocation plan without threatening the whole structure of television. As we stated in our proposals and comments in the FCC allocation proceeding:

> CBS believes that experience under the sixth report and order has demonstrated an urgent need for revision of the present allocation plan in order to meet more satisfactorily the imperative present demands for additional competitive facilities while at the same time allowing for expansion of television services in the future and avoiding any significant reduction of existing services.

Senator PASTORE. I do not want to anticipate you in any way, Mr. Lodge, but the thing that concerns me at this very point is this: Apparently the FCC has already made a decision to go forward with the spirit of the sixth report and order. Now are you going to discuss the inadvisability of that anywhere along in your statement, or do you want to comment on a direct question that I might propound to you now.

Mr. LODGE. I would be glad to answer your question.

Senator PASTORE. In view of what you have said up to this juncture, unless I am anticipating it—I do not want to do that because it prolongs the hearing—are you prepared to give an opinion as to what you think of the decision on the part of the FCC already taken, to go forward with the sixth report and order and await this general survey and study that they are going to make, and which is going to take about 6 or 7 months, in order to determine what they should do as a permanent solution?

[1] The information referred to will be retained in the committee's files.

Mr. LODGE. Yes; though I discuss it later, my response to your question is that we recommend that there are certain changes that can be made within the confines of the sixth report and order, that probably they would not be in position to make until they have completed their study, though.

Senator PASTORE. What do you suggest that they do in the meantime; that they suspend the granting of these assignments, or do you feel that they can go forward and then determine later on what they ought to do—or don't you want to comment on that phase yet?

Mr. LODGE. We have not categorically stated that. We are definitely not of the opinion they should hold up action in the future and have a freeze in the meantime.

Mr. COX. Not?

Mr. LODGE. Not.

Senator PASTORE. The only way, sometimes, I can get a specific answer to a specific question is to cite a specific case. Are you familiar with the situation in Hartford?

Mr. LODGE. Yes.

Senator PASTORE. Now there was a representative of the ABC here yesterday who made the statement that he did not think that channel 3 ought to be granted to Hartford in the meantime; that possibly they ought to go someplace else. I do not want to get into that phase of where it ought to go, but along the lines of the question I have already asked you now, do you feel that it would be inadvisable at this time to go forward and to begin making grants and mixing these UHF areas with VHF, and then expect to unscramble it later on? If you are prepared to make a comment on that, if you do not feel you should——

Mr. LODGE. My comment is along further in my testimony.

I do touch on that further along.

Senator PASTORE. All right.

Mr. LODGE. But while emphasizing our view that there is need for revision of the present allocations, I should equally emphasize what must be exceedingly apparent to this committee—what indeed, may be the clearest point in this whole complex of issues—that there is no solution which will, or can, please everybody and hurt no one. To quote the statement of Dr. Stanton, president of CBS, in a letter to the Chairman of the FCC:

> At this stage of television's development in the United States—with a public investment of $15.6 billion and 453 stations on the air serving 36 million receivers—we believe it is imperative to recognize that there is no panacea which can increase the opportunities for a truly competitive nationwide television service without hurting someone to some degree. It is our opinion that many previous attempts to remedy the sixth report have foundered on the failure to recognize this basic fact. The result has been a continuing search to solve the problems which have developed since the sixth report by trying to find some formula under which everyone would get something and no one would lose anything. This is wishful thinking. We are convinced that no such formula exists.

It is clear, therefore, that the decisions which must be made are hard ones. Principles which are wholly desirable in the abstract may, and often do, result in irreconcilably conflicting allocation plans when reduced to practice. Indeed, one of the most dangerous games that can be played in this field is to state and accept general principles—with which, on their face, no man of good will could disagree—without demonstrating exactly what happens when these principles are reduced to a specific nationwide allocation plan.

I noticed yesterday you asked a question very much on that point, Senator.

For what I hope to make clear as we get down to specifics in this statement, is that principles are meaningless, useless and often misleading, until their application is precisely determined. In this field of allocations, everything has a price. To get A, you must give up B—or sometimes, B, C, and D. I cannot overemphasize, therefore, the importance of testing the general by the specific. Until you see the entire practical application of a particular proposal, with all of its side effects, you cannot tell whether you can afford the structure you are planning—or, inded, whether it will work at all.

Thus, and it is this lesson which above all must be learned before going forward with an allocation plan, it will not do simply to state principles, no matter what their surface attraction. These principles can only be tested by translating them, precisely and explicitly, in terms not only of who gets what, but even more important because in this field, as I've noted, you cannot get something for nothing—who loses what.

One more generality before I get to a specific analysis of the problems and the various plans or proposals which have been advanced: In determining the practicality of any plan, and finding its price, the primary touchstone must be the public. Harsh as it may sound, the first test against which to evaluate the several proposals cannot be a handful, or even a hundred, station operators or potential station operators, and their economic survival. Rather, in testing any plan, the questions must be, How does it affect the services to the public? Do they get more or less? Are they being forced to give up what they have demonstrated they like, and what they have gone to considerable lengths to get, in exchange for no service at all, or less service, or a different service which somebody has decided they ought to like, or ought to have.

We believe that some of the proposals which have been advanced here, and which appear on their face so attractive, are in fact fatally defective because they have ignored these basic considerations. They are rationalizations built out of the difficulties of individual station operators; and in their understandable anxiety to improve their own unhappy position, they have overlooked the public and the cost to the public of their proposals.

So much for generalities. I turn now to a more specific discussion of the problems and the proposals.

THE NATURE OF THE PROBLEM

Before we seek to solve the allocation problem, it is well first to try to isolate and define its precise nature. What the present difficulties are can, perhaps, best be defined by determining first just what the purposes, the objectives, of a television allocation plan should be; second, how far the current television pattern of service has gone in achieving those objectives; and third, the reasons why those objectives have not been met. Only after such a diagnosis is it possible intelligently to remedy whatever it is that ails the system.

So first to the question of the objectives of a television plan. They have been well summarized by the FCC itself in its recent notice of proposed rulemaking:

(*a*) At least one service to all areas.
(*b*) At least one station in the largest possible number of communities.
(*c*) Multiple services in as many communities as possible to provide program choice and to facilitate competition.

If these objectives are thus properly stated—and there has been no serious quarrel with them—we come to the second question: How nearly has each been achieved? The sixth report did, on paper, realize these objectives in this order of priority. By its allocation table issued in the sixth report and order, the FCC provided for assignments of television channels which theoretically would have (*a*) given a signal to virtually all areas in the United States; (*b*) given 1,240 United States communities their own stations; and (*c*) provided the opportunity for at least four competing nationwide television networks and many hundreds of independent stations in large and small markets, as well.

But, in fact, television has not worked out that way. Our television system as it has developed has attained only the first of these objectives. It has fallen short of the other two.

Objective (*a*), at least one signal to all areas, has been substantially achieved, since service has been brought to over 96 percent of the families in the United States. The small population currently unserved will increasingly come to be served by the erection of satellites and translators which give promise of bringing television service to those sparsely populated areas that cannot support program-originating television stations.

Objective (*b*), community stations, is being attained in only about 350 of the 1,240 cities in the continental United States to which channels have been assigned.

Objective (*c*), multiplicity of services, has only partially been achieved. About 84 percent of the families of the United States live in television markets which can, in fact, support 3 or more equally competitive television stations, but only 63 percent of the families live in markets which have been assigned 3 or more equally competitive stations under the sixth report. We estimate that the 100 leading television markets, which have been assigned 263 competitive commercial television channels, could actually support at least 400 stations. True, in these markets there are enough channels for 400 stations, but many are unused because they are not competitive—a subject to which I will turn in a moment.

And so, having determined the purposes of an allocation plan, and the respects in which the current plan has, in fact, proven to be defective, we can go to our third inquiry: Why have the second and third objectives not been met? Why has there been such a gap between the allocation plan's achievement of the second and third objectives on paper and its failings in practice?

The answer would seem to be obvious: Had all the channels assigned by the sixth report been taken up for use by stations, there would be no gap, the objectives would have been achieved, and none of us would be here today. The stark fact, however, is that the channels have not been taken up. The next question, therefore, which we must answer before we can seek solutions is: Why have they not been taken up?

Again, the answer to this question seems simple and clear: The channels have not been taken up, or where taken up have been abandoned, because they were not economically supportable. And it is here that we come to the critical questions, the answers to which must chart the course to any solutions: What are the factors which create this problem of economic unsupportability, and which of these factors can and should be alleviated by a revised allocation plan? For it is not enough to assign the channels where they would fulfill the objectives if they are taken up; it is necessary to assign them where they will be taken up and be supported. After all, the allocation problem now is primarily an economic one, secondarily a political one, and only in a limited sense an engineering one.

There are three principal, but separate, factors that render actual or potential stations incapable, in current circumstances, of operating at a profit. One factor is the competitive disadvantage which a UHF station suffers as against a VHF station. After all the testimony that this committee has heard I need not elaborate on the competitive inequality of a UHF station with respect to a VHF station. It is a problem both of conversion and of signal propagation.

A second factor militating against profitability is the disadvantage suffered by a station which is located in a smaller city whose viewers also receive service from other television stations in a larger neighboring city.

The third factor leading toward unprofitability occurs where the market area which the signal can reach is, in any event, too small to support a station.

Some stations suffer from a combination of these disabilities. Bridgeport, on which so much attention has been focused here, is an example of a station which suffers severely from the combination of the first two factors. Nevertheless, each of these is a separate and distinct source of economic trouble. One is the problem of UHF intermixture, the second that of the overshadowed city, the third that of the submarginal market. They are frequently, but should not be, confused.

Two of these factors—the second and third—are inherent characteristics of the geography of the location of population in the United States, in relation to the coverage areas of television stations. Many of the 1,240 communities in the United States to which television assignments have been made could not support stations in the immediate future. Of course, a day may come when it will be possible to operate a television station profitably in many communities that cannot now support one. But this is a problem which does not yield to a revised allocation table. To the extent that many of the 1,240 communities were assigned channels for the distant rather than for the immediate future, the failure of the channels to go on the air immediately should not be counted as a problem requiring solution right now.

And so there remains, insofar as a modified allocations plan is concerned, the problem of remedying those defects which are the result of the intermixture of UHF and VHF channel assignments in the same or overlapping markets. There is insufficient multiplicity of services (objective (*c*)) because the UHF channels assigned to the leading markets are unable to compete with the VHF channels in those markets. Similarly, the opportunity of smaller communities served with good signals from outside cities to have their own television stations (objective (*b*)) is usually limited because they are assigned UHF channels which would have to compete against VHF signals from the larger cities.

An allocation problem exists today, therefore, principally because, as hindsight has proved, a basic mistake has been made in the nationwide pattern of television assignments. That mistake is the intermixture of UHF and VHF channel assignments in the same or overlapping television markets. While the mistake is clearer now than when the sixth report was issued, and while, as of that time, it could not be said the Commission was wholly unreasonable in its hopes and expectations, I must point out that CBS, as well as others in the industry, consistently warned against intermixture throughout the formative period of our national television system. See exhibit 1, attached herewith: It is a brief summary of our consistent opposition to intermixture during the formative period of the present allocation plan.

Exhibit 1 is a loose sheet—of which there are three—contained in the same envelope as my statement. It is a brief chronological summary of our opposition to intermixture. I won't go through and read all the quotes.

Senator PASTORE. I think it ought to be inserted in the record at this point.

(The information referred to is as follows:)

CHRONOLOGICAL SUMMARY OF CBS OPPOSITION TO INTERMIXTURE

December 1948: "* * * should both VHF and UHF assignments be planned for the same city?" (Lodge, FCC Engineering Conference).

August 1949: "* * * the proposed table of allocation * * * is unsound to the extent that it establishes widespread mixing of VHF and UHF channels in individual communities" (CBS statement re FCC Report 49–948).

September 1949: "* * * An increase in the number of cities which would have both VHF and UHF television transmitters would not appear to be in the public interest * * * the projected UHF stations would be required to operate at a serious competitive disadvantage with the VHF stations. * * *" (CBS comments, docket No. 8736 et al.).

October 1950: "* * * UHF television stations are capable of rendering a real public service, but our present limited experience indicates that stations assigned to these frequencies should be expected to compete most effectively with other UHF stations in the same area. * * * Columbia believes that mixing of UHF and VHF channels in individual communities should be avoided wherever possible" (Lodge, in docket No. 8736 et al.).

September 1951: "It is generally agreed, and the Commission itself has recognized, that for a considerable period, perhaps 5 years, perhaps more, a commercial UHF station cannot compete on anything like an equal basis with a commercial VHF station in the same community" (Ream, in docket No. 8736 et al.).

June 1954: "We are persuaded that the events since the lifting of the freeze confirm the correctness of our view, expressed in 1950–52, that the UHF portion of the spectrum should not be used in such a way as to require it to compete with the VHF portion of the spectrum in the same markets" (Stanton, before Potter Senate subcommittee).

December 1955: "There is now, however, ample evidence that, normally, UHF stations are not competitively equal to VHF stations" (CBS comments, docket No. 11532).

Mr. LODGE. I point this out not because "I told you so" helps the problem or gives us any satisfaction. I point it out only because there have been some implications that the networks are somehow responsible for the present situation. The accurate fact is that the real culprits are the physical laws governing signal propagation and the expensive conversion required to receive UHF signals.

CONFLICTING OBJECTIVES

Thus, I believe we have answered the three threshold questions: (1) What are the objectives of an allocation system; (2) how nearly have these objectives been met by the current plan; and (3) to the extent that it has failed, why has it failed? By thus isolating and identifying the disease, I believe that I can now go on to discuss and evaluate the possible remedies. But before doing so, we must face another hard but inescapable fact: Given limited spectrum space and the competitive disadvantage of UHF, these three objectives, each so wholly important, appropriate, and desirable, are, in considerable degree, mutually exclusive and conflicting.

Remedies that serve to achieve one of them will usually be found to injure another. Any evaluation of a proposed action to meet the allocation problem, therefore, involves exceedingly hard choices—a delicate balancing of its contribution toward one objective as against any loss to the others, as well as the cost of adoption of the proposed action.

Senator PASTORE. At this point, Mr. Lodge—this may be a rather unfair question to you, particularly, but I am going to ask it anyway, and if you feel it isn't within your purview to answer it, you don't have to: Much of the complaint that has been made by some of the UHF operators is the fact that they have a contract with a network and the relationship seems to be fine. Then a VHF assignment is made in that community, and their complaint is that they lose their contract with the network, and the network picks up a contract with the new VHF assignment.

The first question I ask you: Would you agree with that statement?

Mr. LODGE. I have heard that; yes.

Senator PASTORE. Is the statement true?

Mr. LODGE. It is true in some cases. We have dropped UHF's and picked up VHF's.

Senator PASTORE. I think it is important for the record for you to tell us why.

Mr. LODGE. I think I can answer that.

Senator PASTORE. Yes. I think you should. I think we ought to have an answer from your point of view.

Mr. LODGE. I don't want to pretend to give all the business reasons, but I can give you the engineering reasons.

Senator PASTORE. I think some of the business reasons are important, too. I mean, if we have any witnesses here who can testify to them we will be glad to hear them, because when any charges or countercharges are made against the networks, I think we ought to get their side of the question too.

Mr. LODGE. The answer is a very simple one. We believe we would serve a larger audience and deliver more homes to an advertiser by making such a shift, just in attempting to improve the coverage of our network.

Mr. COX. Do you believe in the case of Fresno that by dropping affiliation with KJEO, and taking an affiliation with KFRE, you will actually provide service to people who do not now receive television service—in substantial numbers?

Mr. LODGE. I do.

Mr. Cox. That is, areas which are white, in the true sense that they receive no signals, either from Fresno or from outside areas?

Mr. Lodge. Yes. I am sure we will serve homes with KFRE that we do not serve presently.

Mr. Cox. Can you tell us to what extent?

Mr. Lodge. I don't have the quantitative number of homes, but my recollection is that there would be a strip, a ring, which in theory is about 20 miles in extent; in other words, our service area would be extended to the extent that we can theorize on paper by about 20 miles in radius, but in actual practice, particularly in the coastal side of the California Valley, there are many rugged declivities in which there are homes—living in river bottoms—who I am sure now fail to get UHF at all, and who will get the new VHF station.

Mr. Cox. Are your estimates as to added coverage based upon predicted coverage for the present UHF station and predicted coverage for the VHF station, under FCC engineering standards, or are they based upon actual measurements of present UHF service?

Mr. Lodge. They are based upon the sum total of our best judgment of what our service is at the present time and would be after the VHF is built. Obviously, we have no measured information on the VHF because it still is not on the air. So I have to make my appraisal of how the service will compare from the station not yet on the air with the one that is now on the air; and based on all the information we have, we will improve and increase the number of homes that we serve.

Mr. Cox. I am not sure you answered part of my question.

Mr. Lodge. I am sorry if I didn't. I tried to.

Mr. Cox. That was as to whether or not this estimate that you extend your service 20 miles, is that beyond measured coverage of the present UHF station?

Mr. Lodge. I do not believe we have a measured survey on KJEO, so it would not be based upon a measured contour of either station since, as I said, the V is not on the air, and I do not believe we have a measured contour of KJEO. It would be an estimate to project, with the best information we have, the extent to which the service area would be expanded.

Mr. Cox. Are your calculations of service areas, where you lack actual measurements, based on standards which give you a wider coverage than is obtained under FCC calculations?

Mr. Lodge. In some cases they are wider; in many cases they are not as wide as those of the FCC's standards, because we have found that in practice they do not match what we have found to be the exact natural pattern of listening. I can give you an example.

Senator Pastore. Well, before you go any further, Mr. Lodge, let's face it: Every operator of every station and every network, academically, is interested in the public interest. We start on that score; but from a practical point of view, every operator and every network is in the business to make profits, which is a legitimate objective. I am not being critical, and whether or not you are right, at least you are making your new contracts with the VHF stations because you think it is more profitable to do so. Am I right?

Mr. Lodge. We think we will serve a larger audience, and that that, in the long run, is desirable.

Senator Pastore. I am trying to get away from academics.

Mr. LODGE. Sure. We want to be the best network.

Senator PASTORE. Where you can get the best deal?

Mr. LODGE. I don't know. We want to serve more people than our competitor.

Senator PASTORE. Let me change that way of putting the question. In other words, you think it is better from an economic point of view for CBS to make a contract with a new VHF station, as against renewing an existing contract with a UHF station, because you feel that it will service more people and it will bring a better economic relationship between the two parties in the new contract.

Mr. LODGE. I do know about the last part of your question, and I am not trying to avoid it, but we certainly feel we will serve more people that way.

Mr. COX. That will bring more advertising revenues to you in competition with another network or with the local station in that area?

Mr. LODGE. It is a very competitive business. We would like to do the best we can in opposition to our——

Senator PASTORE. I want a categorical answer on this. I think we are all being too cagey on this. I understand it. I am not critical. The big question is why, when a VHF assignment is made—and I think this is important for the members of Congress that have to decide these questions. I think we should get truthful answers; not that I am saying anyone is giving false testimony, don't get we wrong on that—but I think we should have direct answers. The reason why the networks are making contracts with the new VHF assignments is because they think it is better for them to do it that way, economically and otherwise, and let's face it. I think we ought to get direct answers on it——

Mr. LODGE. Well——

Senator PASTORE. Because the UHF stations come in and say they are being pushed around—are they being pushed around? In other words, if the tables were reversed, would the UHF operators do the same things themselves?

Mr. LODGE. I think they would.

Mr. COX. Have you had any complaints as to the service that has heretofore been afforded by the UHF station in Fresno? That is, within the limits of the propogation characteristics of its channel, has it provided a good TV service?

Mr. LODGE. I personally know of no letters from the public, if that is what you mean, complaining of poor service.

Mr. COX. Has it achieved substantial coverage within the outer limits of the range of its signal?

Mr. LODGE. The data that I have are not very complete as to the outer range. Within Fresno and its immediate environs, there is good reception on UHF.

Mr. COX. Do they get a good signal into Merced?

Mr. LODGE. I have only hearsay comments on that, which indicate that it is marginal in Merced and that some people get good service and others do not get snow-free service on UHF.

Senator PASTORE. May I pursue this a little further, Mr. Lodge?

How would the public interest be affected in the event that the Congress allowed authority to the FCC to interfere in this liberality on the part of the networks in changing from UHF contracts to VHF contracts in a particular locality?

Mr. LODGE. I am afraid I can't answer that question, sir. Mr. Salant might be able to.

Mr. SALANT. Sir——

Senator PASTORE. Do you understand my question?

Mr. SALANT. Yes. This is a subject which we plan to deal with rather comprehensively in the last phase of these hearings dealing with network practices. We will then discuss in full the whole issue of our criteria in affiliating with stations: Why we affiliate with some stations, why we don't affiliate with others. There is a fixed policy and pattern which we will describe in full at that time.

Senator PASTORE. All right. That satisfies me. I think that the record ought to be made clear on that, because one will get the impression sometimes in listening to some of these operators that maybe we ought to interfere in that sphere. Now the question I asked for the record is how will that affect the public interest one way or the other?

Mr. SALANT. We will address ourselves specifically to that question.

Senator PASTORE. I think that is a very important phase of it.

Mr. SALANT. Yes, sir.

Senator PASTORE. You were on page 10.

Mr. LODGE. Three main factors cause the objectives to come into conflict. The first, and the most important is the fact that a UHF station at full power usually has a coverage area substantially smaller than a VHF station at the same location. Consequently, those solutions which involve the substitution of UHF for VHF service in a particular area in order either to promote community stations or multiplicity of services will usually involve some reduction in the total area served—thus impairing objective (*a*)—at least one service to all.

The second factor leading to conflict of objectives is the physical fact that when a new station is dropped in among stations assigned by the sixth report its area of interference will generally greatly exceed its area of service. Consequently, the use of such drop-ins for community television stations will frequently reduce the multiplicity of service (objective (*c*)) and possibly the number of families receiving at least one signal (objective (*a*)).

The third important basis of conflict among the objectives is the scarcity of VHF channels. If a VHF channel is available for assignment in any area, its use for the community station objective will generally preclude its use for the multiplicity objective, and vice versa.

With these conflicts in mind, let us now examine the various solutions proposed, to see how they serve or disserve the objectives of our national television policy, and at what cost.

PROPOSED SOLUTIONS

Many proposals submitted to the FCC and described in testimony before this committee aim at specific changes in particular markets. The cumulative effect of these proposals, plus similar ones that would be forthcoming if these were adopted, would lead to a general modification of the basic structure of the allocation system as laid out in the sixth report and order. Other proposals have attacked the problems in greater generality. All these proposed solutions can, I believe, be summarized in three broad groups.

1. Deintermixture;
2. VHF drop-ins on present VHF channels;
3. New VHF channels.

I shall consider each of these groups of proposed solutions in turn.

DEINTERMIXTURE

Since the present allocation problem largely arises from intermixture, it might seem that the most obvious remedy would be to eliminate intermixture by a procedure that has come to be called deintermixture.

Senator PASTORE. May I interrupt you, please? This is a little bit far afield from the present point that you are discussing, but yesterday—and I am directing my question now to Mr. Salant—Mr. Jahncke, in testifying before the committee, in his remarks yesterday on page 7 made this statement:

> This committee should consider interim regulation of VHF stations in monopoly and duopoly markets by a variation of the plan suggested by Dr. DuMont in the Potter hearings 2 years ago. This would require—

this is the important part of it—

> this would require VHF stations in a market where there are less than 3 competitive outlets to share their service equally among the 3 networks.

I should like to have a comment—not now, but later on—from CBS and NBC on that point.

Mr. LODGE (resuming). That procedure (deintermixture) involves the shift of VHF station assignments in certain television markets to UHF so that the markets concerned will have only UHF stations competing with each other. The cancellation of the VHF assignments will usually permit additional VHF assignments elsewhere.

Just how far deintermixture might be pushed depends on the extent to which we are willing to incur its considerable cost to the public in terms both of dollars for set and antenna conversion and of service loss to fringe areas which can be reached by VHF signals but not by UHF signals. Let us consider in turn various degrees of deintermixture from the most modest to the most extreme, and assess the extent to which each serves or disserves the objectives of the allocation plan. I shall also try to indicate the dollar cost to the public of conversion under each plan considered.

In making this evaluation of various deinteximture plans, a fundamental fact is the difference in the coverage of VHF and UHF stations. In general, UHF gives less coverage than VHF. Just how much smaller the service area of a UHF station will be as compared with that of a VHF station depends upon the local conditions governing radio wave propagation, principally the terrain. In some localities, Florida for example, the two types of signal may be fairly nearly equal in service range. In other areas, where conditions are less favorable, the radius of coverage of the UHF station may in some directions be a small fraction of that of the VHF station. As a broad general average, I would judge that while a full power VHF station can be expected to have a service radius of at least 60 and frequently more than 75 miles, a UHF station at full power will do well to have a service radius of 35 miles and very well indeed to have one of 50 miles. Translated into terms of area, this means that, on the average, a VHF station may serve 2 to 4 times the area of a UHF station. But UHF has another drawback: If the terrain is rough, or if there are large buildings or other high objects casting a shadow, a UHF station will have many local pockets of poor service creating a "swiss cheese" effect in its coverage pattern.

In any actual case of the substitution of UHF for VHF service at a market center, some of the lost service area can be made up by the appearance of new stations in outlying cities. But the area that loses service may frequently not have a population large enough to support a station by itself, even though it may represent a substantial addition to the population served by the VHF station at the market center.

Mr. Cox. In that connection, Mr. Lodge, you suggest that a VHF station may serve 2 to 4 times the area of the UHF station. Now in many areas, because of population concentration, the difference in number of homes served would be substantially less—isn't that true?

Mr. Lodge. On two factors: First, because you might be penetrating into other markets well served from within, and also because the population density tends to fall off as one goes into rural areas. But I would like to add, however, that the shadow areas—and you have them even in rolling terrain such as surrounding Washington, New York or Providence—that back of the hills, if a person lives 200 feet down behind a rolling hill, his service from UHF would be quite inferior, so the loss is not confined just to a theoretical range.

Mr. Cox. We were advised, I think yesterday, that it was agreed in the Hartford deintermixture case that the issue of white areas was not involved.

Mr. Lodge. I believe that was based more on theory than on fact.

Senator Pastore. How are you going to overcome this argument on intermixture if that is the case? If you happen to be behind one of these rolling hills and you won't get UHF so well, then how are you going to argue against a VHF being assigned by the Federal Communications Commission, if they take the position "We feel that the public interest requires our assignment of a VHF station to give them a better quality of signal"? How are you going to argue against that?

Mr. Lodge. You get right down to a choice of choosing the lesser of several evils: A limited number of competitive assignments, on the one hand, or equal competition, and a few people would lose service in achieving that.

Senator Pastore. Would you make the categorical statement that unless something is done about deintermixture, it might well mean, in time, the complete disappearance of UHF from the TV scene?

Mr. Lodge. No; I don't believe that would necessarily happen, unless there are additional VHF channels made available. I believe that the pockets of UHF operation—such as Scranton, Wilkes-Barre, Youngstown, South Bend, and there are others—where you have UHF operating successfully today, and where they are not suffering from competition from VHF—I see no reason, as long as the channels remain available to those stations, why they cannot continue to give satisfactory service to the people now receiving it.

Mr. Cox. Would that provide a sufficient economic base for the future development of better transmitting and receiving equipment in the UHF area, and would it in any sense stimulate the production on a nationwide basis of all-channel receivers, which would eventually, perhaps, contribute to ability to intermix allocations?

Mr. LODGE. I don't believe those pockets would stimulate nationwide distribution of all-channel receivers. I don't pretend to be an expert on manufacturing, as to how many potential buyers you have to have to keep the market flowing with UHF receivers, but I feel quite sure that if there is a hundred thousand or two hundred thousand potential receiver sales in UHF markets, that there are plenty of manufacturers who would be glad to try to sell those sets. In other words, there will be UHF sets continued to be available even for this smaller number of markets.

Senator PASTORE. But following it a step further, we are not actually talking about a nationwide competitive TV system, though, are we, insofar as UHF is concerned? What we are actually talking about is either the establishment, or the maintenance, of a UHF island, so to speak.

Mr. LODGE. That, I believe, is the trend that is going on now. There has been a great deal of talk about the excise tax. That could well be a tool which, if used, would encourage the spread of all-channel receivers.

Mr. COX. If you have UHF continuing in existence only in Wilkes-Barre, Youngstown, South Bend, and the areas where there are, as I understand it, not even any allocations of V channels to compete with them, how is that ever going to permit UHF to function as a part of the development of a nationwide competitive TV system? Aren't you going to be limited for all time, unless additional V channels are obtained, to the number of multiple services in the number of markets which can be accommodated by the present 12 VHF channels?

Mr. LODGE. I believe there are some improvements that can be made in the utilization of the present 12 channels, but I agree with you that if UHF is limited to, let us say Scranton and the other cities, it is not going to have people buying UHF receivers here in Washington, D. C.

Senator PASTORE. May I interrupt at this point?

This is off the record.

(Discussion off the record.)

Senator PASTORE. Let me call a recess until 11:20, and if in the meantime Senator Potter comes in he can resume the hearings before that time. Is that satisfactory to the witnesses? I hate to do this to you, but I have to go to this presentation.

(Short recess.)

Senator POTTER (presiding). Mr. Lodge, we have a free substitution rule here in the Senate. [Laughter.]

Mr. LODGE. The two-platoon system.

Senator POTTER. I personally regret that I had another committee responsibility that kept me from being here when you began your statement, but you may proceed now.

Mr. COX. I have a question, Senator.

Senator POTTER. Yes.

Mr. COX. The point I am trying to make, Mr. Lodge, is that if UHF can provide a satisfactory service only in the three communities you mentioned, and maybe a couple of more——

Mr. LODGE. There are more than that. I didn't list them completely.

Mr. Cox. That means that for the balance of the country we can look only to VHF to provide us with a competitive nationwide TV system—is that right?

Mr. Lodge. Unless something is done to encourage the sale of UHF receivers.

Mr. Cox. Which you say will not come on any nationwide basis just from the maintenance of these limited markets.

Mr. Lodge. I would think not, unless the excise tax change is made.

Mr. Cox. Why is UHF able to provide a satisfactory service in Scranton and Youngstown and not in other areas? Aren't those areas rather rugged terrain?

Mr. Lodge. You have to say what satisfactory is. It is satisfactory to the people who live there, and the people who are beyond the range of the stations do not know that they are missing something.

Mr. Cox. Isn't it true that the service that you talk about losing through deintermixture is largely service that has not yet been received?

Mr. Lodge. No. If you deintermixed, that would mean taking away some VHF service that had already been established there, and in that case, you would really hear about it.

Mr. Cox. That isn't true in Hartford, Madison, Peoria, Evansville, Fresno, and a number of other areas, is it?

Mr. Lodge. If the stations are not yet on the air. That is correct.

Mr. Cox. And with respect to the Fresno situation where you said you thought you were going to serve additional areas, isn't it true that signals from Salinas and Bakersfield do come into the marginal coverage area of the Fresno stations?

Mr. Lodge. There is service coming in from outside of a marginal nature, but it is not as good as the high-grade quality picture that could be achieved from the local Fresno V.

Mr. Cox. If UHF is not going to be a satisfactory service in certain areas, why is it that CBS is buying a UHF station at Hartford? Aren't you going to have a problem giving satisfactory service there to viewers, if there are hills and shadowed areas?

Mr. Lodge. Again, we feel it can serve a substantial number of homes with a good signal there. True, we would like to serve more, but the number that we can serve is a substantial number.

Senator Potter. How much power will you have in your new UHF station in Hartford?

Mr. Lodge. The application we have filed is to continue the power at present, as I recall, around 250 kilowatts ERP.

Senator Potter. Do you have any plans for increasing your power to the maximum amount?

Mr. Lodge. We have not filed such an application with the FCC in the initial stages. Normally, in the development of the station I imagine we would.

Senator Potter. Do you agree with the testimony of Mr. Moore, or his engineering representative, that the engineering required for a UHF station can be developed to bring in a signal——

Mr. Cox. Mr. Jahncke——

Senator Potter. Yes; Mr. Jahncke's engineer.

Mr. Cox. Mr. Marx.

Senator Potter. Which is comparable to VHF?

Mr. LODGE. I am afraid I cannot agree with him on that. Where the service is good, near the center and out for a certain distance, they will be quite comparable; but there will come a time, both for the people who live down in valleys and behind hills, and as you get out behind the curvature of the earth, 30, 40, 50, 60 miles out, where I know of no way of making them equal.

Senator POTTER. Even with increased power?

Mr. LODGE. Even with increased power. If you want to presume towers that are 3 or 4 thousand feet high, then, theoretically, it could be done; but given the same tower heights, I know of no way of making them equal.

Senator POTTER. Then it is your position that UHF is an inferior signal?

Mr. LODGE. Its signal is just as good as the VHF within confined areas. It cannot equal VHF in service range.

Senator POTTER. What would be the maximum range under maximum power?

Mr. LODGE. It depends entirely on the terrain. Before you came in I mentioned Florida as a case that is extremely favorable to UHF, and under those conditions, many people, and I among others, have seen a good signal 50 and 60 miles away from a UHF station. You mentioned Hartford. I would like to use that as an example on the other side. The town of Waterbury is 19 miles from the transmitter of the station we have been discussing, and which we are hoping to purchase—and in Waterbury, 19 miles from that station, you cannot find a picture—19 miles away. So you have the two extremes: 60 miles, pretty good in flat territory; 19 miles away you can't even find a picture in another condition.

Mr. Cox. Are those people without TV service, or do they get service from other stations?

Mr. LODGE. They get marginal service from New York, 75 miles away, rather than service 19 miles away just because of the terrain and the difficulties of UHF bending over the hilltops.

Mr. Cox. If you think you can provide a substantial service in Hartford, then that same service could be provided by UHF stations in any area that might be deintermixed to all UHF service?

Mr. LODGE. Yes. The problem, of course, becomes whether or not in that restricted fringe there is enough population to support other stations so that you will replace the lost fringe service with new stations.

Mr. Cox. I would like to raise this question: Is there some danger that in trying to get the maximum coverage from one signal—to get a service to everyone, even in outlying areas—we will, in insisting on carrying out all of the provisions of the sixth report, effectively kill off any substantial UHF development, so that for all time the people of this country are going to suffer under the limitations of a TV system that can only grow to a certain point, and then has to stop.

Mr. LODGE. Definitely. That is what I meant earlier when I said there was a basic conflict between the three objectives—the objective of getting competition on the one hand, and the objective of getting one signal throughout the country on the other.

Mr. Cox. Would you care to say which of these conflicting objectives you think is the more important—to get one service, at all costs, to everybody, or to maintain some flexibility and room for growth in a TV system so that the 85 percent of the people who may be within reach of larger communites can have multiple services?

Mr. LODGE. I think that has to be answered two ways. One, if we were starting from scratch—and the other starting in the year 1956. I do touch on this further on in my testimony.

Mr. COX. Well, fine.

Mr. LODGE. I am not trying to avoid answering your question now.

Mr. COX. Wait and cover it then.

Mr. LODGE. The conclusion, just to anticipate it, is that it is a little late for deintermixture; that it is too difficult to take away from people the service they have.

Mr. COX. This, however, would apply only to deintermixture which involves the deletion of existing VHF stations?

Mr. LODGE. Yes.

Senator POTTER. You may continue, sir.

Mr. LODGE. Keeping this in mind, let us now turn, gentlemen, to the consideration of the most modest general deintermixture plan. That may be termed nondisruptive deintermixture. By that I mean deintermixture that does not involve taking any operating VHF service off the air but merely preventing new VHF services from going on the air where UHF has a good chance of surviving in their absence. By means of nondisruptive deintermixture in a few markets, a few more islands of UHF operations may be preserved. In most cases these would involve UHF stations surviving in a somewhat unequal competition with one VHF station. Experience to date indicates that, in general, UHF stations can survive in competition with one VHF. They have much greater trouble surviving in competition with 2 VHF's, and except in extraordinary circumstances virtually no chance against 3 VHF's.

Mr. COX. Isn't the trouble that they have in surviving in competition with 2 VHF's such that only about 3 stations are presently surviving and, as Mr. Jahncke pointed out yesterday, they are hanging on by the skin of their teeth?

Mr. LODGE. It is darned tough.

Mr. COX. It is so tough as to be almost impossible unless something is done?

Mr. LODGE. I would agree.

Mr. COX. Now, in connection with this nondisruptive deintermixture you are talking about, are you familiar with the plan which was outlined to the committee by Mr. Storer?

Mr. LODGE. That was the term I used of a general nature to describe the Storer plan and several others of a similar nature.

Mr. COX. Substantially this plan—either Mr. Storer's or any other that doesn't involve the elimination of existing V stations—is simply an effort to extend these islands that you talk about in Youngstown and Wilkes-Barre into other communities, so that whatever good could come from that would be increased?

Mr. LODGE. I think "preserve" is a better word than "extend." He was not intending to open up new markets that did not now have UHF.

Mr. COX. I think that is a point well taken, but it would, in effect, give continuity to a number of these areas which otherwise are going to go by the board.

Mr. LODGE. That is right. That was the purpose of his plan as I understand it.

It is a close decision whether the sixth report should be so modified as to prevent additional VHF stations going on the air where such a bar would preserve UHF islands. In my judgment, it depends on what other action is being taken on a larger scale to meet the allocation problem. Nondisruptive deintermixture by itself would apply to too few markets to make a significant contribution to the overall problem. Let us next consider deintermixture with a more systematic basis for selecting markets to be deintermixed, as part of a broader attack on the allocation problem.

Mr. COX. How many would be needed?

Mr. LODGE. More than this would provide in any event.

Mr. COX. Mr. Storer estimated, I think, that the areas which he was discussing included 20 million people and 4 million UHF sets, and I think both Mr. Chamberlain of GE and Mr. Engstrom of RCA indicated that in their opinion that much preservation, for all time, of UHF would provide a substantial incentive to manufacturers to develop improved transmitting and receiving equipment.

Mr. LODGE. Well, I don't think that is the problem so much as how do you get UHF receivers in all homes.

Mr. COX. Don't you start by trying to keep some homes where everybody has to buy a UHF receiver? That is one way to keep UHF stations in operation, by providing them with receivers?

Mr. LODGE. But that makes no improvement over what we have today. That merely preserves the status quo.

Mr. COX. But isn't there some possibility that preserving the status quo, as far as UHF is concerned, will be better than permitting the present trend to continue, which will substantially destroy the status quo?

Mr. LODGE. Well, first of all, we have to go back to the 3 objectives which I spelled out 5 or 6 pages back, which is national service.

Mr. COX. Local service?

Mr. LODGE. A number of signals available in each area, and local service. Now, Mr. Storer's plan, constructive though it is, does not cut into the local station problem one bit. It makes very, very little progress there, and if you gentlemen are anxious to have that third objective—if you want the local station to grow and become a factor in service to the public—there has to be some way to get receivers into all of the towns that these little stations would like to operate in.

Mr. COX. Isn't it true, though, that local service can develop on the margin of an area that is served by all UHF stations, or with only one V, much better than it can on the margin of an area served by all V stations, because there are far more UHF channels that can be allocated for such local services as they become economically supportable?

Mr. LODGE. That was the very point I had in mind, because there are very few cases in point like that—towns where you would get local stations under such a plan. You see it doesn't go to Bridgeport, to Trenton, Asbury Park—I mention these along later on—it doesn't open up towns.

Mr. COX. The only solution that would make possible the development of a local station in those areas is that you find some means to put a V channel in those areas, on whatever basis it may be. Isn't that true?

Mr. LODGE. Well, you could theorize, and I certainly don't advocate shifting everything to UHF. That would also do it, however.

Mr. Cox. In other words, the only way a local station can ever exist in Bridgeport is to be a V.

Mr. LODGE. Or to have all receivers with the UHF band in them. Under those conditions the ability to tune in is no longer a hardship to the local station.

Mr. Cox. You have to either have some device that is going to produce all-channel sets on a nationwide basis or you have to have some sort of a V channel in a market that is overshadowed by a multiple-service V market?

Mr. LODGE. I think that is right.

As an example of a minimum systematic deintermixture plan combined with a broader measure to remedy the allocation problem, we might imagine a deintermixture plan aimed at providing 3 or more competitive stations in those 16 of the 100 leading television markets which could not be assigned 3 or more competitive channels in a controlled VHF drop-in plan, CBS plan I, which I shall describe shortly. I am not proposing this deintermixture plan, but am merely using it here as a convenient example to illustrate the nature and effects of a minimum systematic deintermixture plan.

Such a deintermixture plan would involve a shift to UHF of 27 VHF channels in 16 markets. Twenty-four of these VHF channels are already occupied by operating stations. These 16 markets contain about 4 million families; about 3 million of them already have sets, 2½ million have VHF only. The extra cost of conversion to these families would probably be of the order of $125 million, and more than 300,000 people would be deprived of all television service because of the lower UHF coverage compared to VHF.

This is the responsibility, Mr. Cox, you and I were discussing a moment ago.

Mr. Cox. In that connection, I take it that in these 16 markets you are talking about there are also already UHF stations on the air?

Mr. LODGE. Yes; there are.

Mr. Cox. How many of them—do you know?

Mr. LODGE. No; I don't. I would have to go back to the chart, unless Mr. Alexander has it.

Mr. ALEXANDER. I don't have the total. You can count them up from this. They are listed.

Mr. LODGE. Can you tell me what the cities are?

Mr. ALEXANDER. Yes. The ones in table III, the ones that have on the right-hand side the statement saying "UHF."

Mr. Cox. That is on page III-1.

Mr. LODGE. I have it here if you would like them in the record.

Mr. Cox. That would be San Diego.

Mr. LODGE. That is right.

Mr. Cox. Hartford.

Mr. ALEXANDER. That is right.

Senator POTTER. What page is that?

Mr. ALEXANDER. Page 3 dash 2—Roman III, Arabic 2.

Mr. Cox. Columbus, Augusta, Topeka, Louisville, Baton Rouge, Kalamazoo-Grand Rapids, Rochester, Charlotte, Greensboro, Raleigh, Dayton, Toledo, Erie, and Providence?

Mr. LODGE. That is correct. I want it thoroughly understood we are not proposing such a plan. We merely use it for illustrative purposes to see what would happen.

Mr. COX. You selected those markets not because they are particularly apt for all UHF development, but because they are the ones in which you could not find enough V allocations to provide three competitive V services?

Mr. LODGE. Purely an arbitrary choice to see how much you accomplish with a little bit of deintermixture.

Mr. COX. Do you know—when you say that there would be more than 300,000 people deprived of TV service—that in the areas from which V service would be withdrawn, there are 300,000 people not receiving signals from any other communities?

Mr. LODGE. I am sorry. I did not get your question.

Mr. COX. That is, is your estimate of loss of service to 300,000 people simply based on recalculating the coverage of a UHF station in Hartford as compared to the theoretical coverage of the V, without regard to whether they are getting some kind of V service from New York, from New Haven, or a U service from some other community?

Mr. LODGE. No. These 300,000 people are those who would get no other service at all, because of the shrinkage of the total service.

Mr. COX. That is, you look not only to the service coverage from this market, but all surrounding markets?

Mr. LODGE. All surrounding markets as well. This is new white area, to use the common phrase. Even this plan would bring relatively little relief to overshadowed community stations, however.

Mr. COX. Some of them, at least, are in fairly populous areas where there may be satellite communities which in time could support their own TV stations?

Mr. LODGE. Yes; but again, only 26 out of 800.

Mr. ALEXANDER. If I may respond to that one: In these particular cases, however, these 26 mostly do not lie in communities that would be good prospects for their local television stations. Perhaps the easiest way to indicate that is that only three of them have ever been applied for, and, as you know, early in the days of the sixth report applications were made for most of the communities that had any prospects at all, because at that time it wasn't so clearly recognized under what disadvantages UHF stations would operate. So that, just as a note on these 26, I would say we can furnish you the list if you like, but they are not very large.

(The list was furnished later and is as follows:)

COLUMBIA BROADCASTING SYSTEM

OFFICE COMMUNICATION

October 25, 1956

To: Mr. Salant.
From: Mr. Blank.
Re the 26 communities that would be freed from overshadowing VHF competition if 16 of the 100 leading markets were deintermixed.
Reference: Page 1817 Magnuson committee hearings.

The attached table lists the 26 communities which were referred to on page 1817 of the Senate committee hearings. These communities are communities which have been assigned only UHF stations, but which lie within the 16 television markets which Mr. Lodge was hypothetically considering for deintermixture at the point in the Senate hearings referred to. If that deintermixture, which was not recommended by Mr. Lodge, but was merely being analyzed for purposes of illustration, were actually to be carried out, these 26 communities, to which 29 UHF channels have been allocated, would be relieved of VHF competition.

DAVID M. BLANK.

CBS-Ec/Ad
October 24, 1956.

Overshadowed communities with UHF channel assignments that would be relieved of VHF competition if 16 of the 100 leading television markets were deintermixed (Re Magnuson committee transcript, p. 1817)

[Population (1950 census), in thousands]

Overshadowed communities:		Overshadowed communities—Con.	
Albermarle, N. C	11.8	High Point, N. C	40.0
Angola, Ind	5.1	Junction City, Kans	13.5
Burlington, N. C	24.6	Kannapolis, N. C	28.4
Campbellsville, Ky	3.5	Lima, Ohio	50.2
Danville, Ky	8.7	Manhattan, Kans	19.0
Defiance, Ohio	11.3	Meadville, Pa	19.0
Elberton, Ga	6.8	Muskegon, Mich	48.4
Elizabethtown, Ky	5.8	Salisbury, N. C	20.1
Elkhart, Ind	35.6	Sanford, N. C	10.0
Emporia, Kans	15.7	Shamokin, Pa	16.9
Fayetteville, N. C	34.7	Sunbury, Pa	15.6
Findlay, Ohio	23.8	Statesville, N. C	16.9
Hazleton, Pa	35.5	Tiffin, Ohio	19.0

Mr. COX. What would be their average population?

Mr. ALEXANDER. I wouldn't be able to judge that now, but we could work that up.

Mr. COX. Can you tell us what is the smallest community to which the FCC made an allocation in the sixth report?

Mr. ALEXANDER. The smallest in the sixth report?

Mr. LODGE. I believe now it was Goldfield, Nev., which had 267 population.

Mr. COX. What would it be for areas in the East and Midwest, for example?

Mr. ALEXANDER. I would have to look that up. In general, the cities follow where the radio stations were, and they go to pretty small communities—in the few thousands.

Mr. COX. All right, Mr. Lodge.

Mr. LODGE. So it will be seen that a minimum systematic deintermixture plan accomplishes relatively little at a fairly high cost. Let us next consider a more sweeping deintermixture proposal. An example of such a plan is that proposed by DuMont in September 1949. Its target was 4 competitive channels in as many as possible of the 326 leading television markets.

At the time DuMont proposed this plan, it involved a shift of 12 operating VHF stations to UHF. Its adoption now would require, in the 100 leading television markets alone, the shift of 53 VHF stations to UHF, 41 of which are already on the air. In the entire 326 cities specified in the DuMont plan, 155 VHF station assignments would have to be shifted to UHF; 105 of these are already on the air.

In the 100 leading television markets alone, almost 7 million families live in those television markets which would lose their VHF service and switch to UHF under the DuMont plan. About 4.7 million of these families now have television receivers, and about 3.6 million of these have VHF-only receivers. The cost of set and antenna conversion to these 3.6 million families would be of the order of $200 million.

While I have not calculated the population which would lose service entirely under the DuMont plan, because of the shorter range of service of UHF as compared with VHF, I believe it would be about a million people.

This would mean going completely white, and not merely deprived of home service.

This plan would clearly serve objective (*c*) since it would provide for four nationwide television services. It was designed to do just this. But despite extensive use of deintermixture, however, this plan still falls short of solving many of the difficult UHF overshadowed community problems. For example, Bridgeport, Trenton, New Brunswick, Akron, Asbury Park, Atlantic City, Reading, Easton, Allentown, Bethlehem, and Worcester, to choose some of the prominent examples, would still be UHF-only cities overshadowed by VHF's, as they are at present. Indeed, the ranks of the overshadowed UHF cities would be joined, under the DuMont plan, by a number of other cities presently assigned VHF stations, such as Providence, New Haven, Wilmington, Del., Johnstown, and many others.

We must conclude, therefore, that while this plan would make a major improvement toward the multiple-service objective, it would make a relatively small contribution to the community-station objective. Further, it would be detrimental to the national-coverage objective to the extent of losing service to about 1 million people, and its dollar cost to the public for receiver conversion would be about $200 million. And this does not include the costs of conversion of established VHF stations, which may be estimated at $30 million, nor their losses from business disruption.

If deintermixture is to satisfy both the multiplicity of service and community objectives, it would have to be even more massive than the DuMont plan—extreme as that plan is in the light of today's circumstances. A deintermixture plan that would permit all of the 1,240 communities assigned channels under the sixth report to be assigned either VHF channels or UHF channels free from competition of VHF, would have to consist of a relatively few islands of VHF in a general sea of UHF. Under such a plan, in order to avoid intermixture at the fringes, the VHF community stations in the outlying fringes of VHF stations in large market centers would have to have their power limited so that their service areas would not expand VHF islands into UHF areas. Otherwise, the outlying community VHF stations would themselves overshadow UHF communities.

I have not worked out the details of such a plan, nor has anyone else to my knowledge. It would, I am sure, involve the loss of service to several millions of people. The cost of conversion to the public would probably be of the order of a billion dollars. So even though such a plan could possibly be devised to meet the multiplicity and community objectives, I believe it would be too injurious to the first-priority objective of at least one service to all areas, and it would involve too high a cost of conversion to the public.

As the extreme case of deintermixture, there has been some talk of shifting the whole television system to UHF. I must say that I see no sense to that talk at this date. If we are considering an ideal allocation system, one using 12 VHF and 70 UHF channels can be designed far superior to one using 70 UHF channels alone.

Mr. Cox. Is that true with respect to any of the objectives other than the first one? I mean, can a system using only 70 UHF channels provide multiple services and permit the development of community stations as they become economically supportable, as well as 1 with 12 V and 70 U?

Mr. LODGE. I would say probably on that score it could, although the service of any one of the individual stations would probably be smaller than many would be under the other system, but you would lose tremendously in terms of people who would have no TV service whatsoever.

Mr. Cox. Because if stations are only going to be located in large communities of a certain minimum size, the only way you can get maximum reach from those points is through the use of a V?

Mr. LODGE. I use the concept it is a byproduct—that the people who are picked up in the fringe of the big city VHF station are picked up more or less as a byproduct of the service to the big city, and those are the people who would lose out. There are millions of them involved.

Furthermore, the transition to an all-UHF system would cost the public and broadcasters between $1½ billion and $2½ billion. It would result in a total loss of service to about 8 million people, even after allowing for more stations to go on the air after the shift to UHF. Since a superior system can be obtained at less cost in money and loss of service, it does not seem sensible to me to consider an all-UHF system now.

Senator POTTER. Mr. Lodge, in your consideration of the loss of service to people by the transition from VHF to UHF, are you speaking of UHF stations as they operate today, or are you speaking of maximum power for the UHF stations?

Mr. LODGE. I am assuming that they improve their power to the full that is allowed at the present time, and I would say in connection with the proposal that they might use five times as much power, that that in practice makes very little difference on the total service. It would not change the answer appreciably.

Mr. Cox. Does it at least serve to eliminate this "Swiss cheese" effect you are talking about?

Mr. LODGE. Again, if you should look at a TV screen with a picture you think is snowy and have that station increase its power by a factor of 5, you certainly would not consider the improvement in service great. A factor of 5 to 1 in power sounds big to the layman; to one used to looking at the picture on the TV screen it is not very impressive.

Mr. Cox. Would you agree with Mr. Marx that some of this high power has not been achieved in a desirable way, in that they have used minimum-power generators or powerplants and high-gain antennas, and they could have gotten a more effective signal if they had used higher power in the first place?

Mr. LODGE. I think some of the UHF stations have had some of their service area poorly served because of overshooting people who might live close to the base of the tower; yes.

Mr. Cox. Is the answer to getting more complete and more satisfactory service within their areas of general coverage to be found in the development of more sensitive receivers rather than higher power, then?

Mr. LODGE. Again, I am afraid that the facts of life are that within the foreseeable improvements in receiver redesign that the amount of improvement cannot eliminate the "swiss cheese" effect completely.

Senator POTTER. I think one of the problems the committee has been faced with has been the conflicting testimony concerning the engineering potential of UHF. Now, if it is an inferior television band as compared with VHF, I think consideration would have to be based upon the inferior quality of the service. If it is a band which can give as good reception and coverage, with certain engineering designs, why I think that is a question that the committee or the Commission, whoever makes decisions in this field, will have to resolve. But we have had engineers here that would tell us that we can look forward in the future to revolutionary things in the field of transmission and receiving, which would make the UHF band competitive and comparable to the VHF band. You state that you don't believe that is so.

Mr. LODGE. I think any engineer who denies the possibility of future progress and blinds himself to that is a very poor engineer, but I don't think that just hope and wishful thinking is going to overcome certain basic physical limitations that mother nature built into the propagation laws of radio signals. I see no way of overcoming completely the deficiency of UHF with regard to VHF.

Mr. COX. In that connection, just for the record, CBS manufactures receivers but does not manufacture transmitters; is that correct?

Mr. LODGE. That is correct.

Senator POTTER. You may continue, Mr. Lodge.

Mr. LODGE. Thus, it seems clear that any systematic large-scale deintermixture would involve such a tremendous cost to the public in dollars and in loss of service that its adoption cannot be seriously considered.

The members of the committee have already experienced, in contemplating the choice between Hartford and Providence for the location of a single VHF station, some of the difficulties of arriving at a decision involving conflicting interests of different cities and States. Any large-scale deintermixture plan would offer dozens or even hundreds of such problems. While some of these choices might be dictated by overriding engineering considerations, an arbitrary choice would frequently be involved. One market would have to lose its VHF services and be shifted to all-UHF, and another would gain some VHF services. From an engineering standpoint, it might be immaterial which market was to be UHF and which VHF, but the political problems and repercussions could reach staggering proportions.

One can easily imagine the reaction of VHF set owners in deintermixed markets when they learn that their present sets will no longer receive a usable signal; that in order to continue to receive television they will have to purchase a converter and UHF antenna at an installed cost of $50 to $100 per home. One can also imagine the reaction of those millions of people who find that they will be unable to receive television at all. This picture of the public reaction to deintermixture has led me to dismiss large-scale systematic deintermixture from consideration as a practical possibility at this late stage of television's development.

In short, various degrees of systematic deintermixture offer various degrees of solution of the multiplicity and community-station objective, with corresponding sacrifice of the nationwide coverage objective, and with corresponding dollar costs of conversion. But as of 1956, deintermixture does not appear to be a practical solution if only because of the public opposition that could be expected.

Senator POTTER. When you speak of existing services, are you also speaking of existing UHF service?

Mr. LODGE. These were drop-ins on VHF and I did not intend to cover the economic effects on the UHF's that were on the air. This was the technical interference effects to the VHF's.

Senator POTTER. Just to existing VHF stations?

Mr. LODGE. Yes.

Senator POTTER. Of course, by VHF drop-ins, you would further complicate the problem of saving the UHF band?

Mr. LODGE. Yes. I was trying to confine myself more to the technical area, but certainly I know there are economic effects to the use.

VHF DROP-INS

Let us, then, next examine those proposed solutions which involve dropping new VHF assignments in among the assignments of the sixth report, by departing from the separation standards of that report. We shall consider the extent to which they serve or injure the objectives of our national television policy.

How many stations can be dropped in, where they can be located, and what restrictions need be imposed on the power, directivity or polarization of their signals depend on what interference to the services authorized in the sixth order is to be allowed. We may accordingly consider first those proposals for drop-ins under which substantial interference would be caused to existing services. Then we may consider drop-in proposals under which existing services would not be impaired.

DROP-INS AT THE EXPENSE OF EXISTING SERVICES

There are a number of proposals for VHF drop-ins which involve substantial interference to the television services provided for in the sixth report. The proposals of Hometown Television, Inc., and Mullaney & Associates are among these. While some of these plans are vague and therefore hard to evaluate, there is no doubt that VHF drop-ins could be assigned to many cities in need of VHF assignments. The cost in loss of service may be illustrated by an example furnished by the president of Hometown Television, Inc.

Mr. Merryman showed you an exhibit[1] of a VHF drop-in added at the center of a 170-mile equilateral triangle, at each apex of which there was located a full-power low-band television station. That exhibit showed a loss of some 3,770 square miles of television service to obtain about 310 square miles of new service for the drop-in station. This exhibit failed to take into account the fact that the drop-in station would not be offset to one of the 3 existing stations under the present 3-frequency offset system.

[1] See second exhibit facing p. 466.

Again, Senator Potter, you came in a little late, but there was attached an exhibit.

Senator POTTER. This is the exhibit?

Mr. LODGE. This is the exhibit; yes.[2] I will read my testimony and return to the exhibit in a moment.

If this is taken into account, exhibit 2, attached, shows what would happen. The loss of service from the existing stations as a result of the drop-in would increase to 6,720 or to 9,750 square miles, depending on whether the offset carrier operation used was a 3-frequency, used today, or a 4-frequency method. The service area of the drop-in station under these circumstances would be either 150 square miles or 285 square miles, depending on the offset method used. Consequently, for every square mile of service added by the drop-in station, 35 to 40 square miles of existing service would be destroyed.

I think maybe an exhibit like this is a little confusing, so if we can just look at it, I will indicate that the white area at the center, in both case I and case II, indicates the service that would be left to the existing VHF station after the effects of the drop-in had taken place. The double crosshatched area is the new interference that would be caused by the drop-in, and the more lightly and outer crosshatched area is that which is occasioned mutually between the stations at the present time.

You will see that right in the center of the triangle is the very little white area enclosed by a black circle, with "drop-in" written underneath it, indicating the relative size of the new area of service that is achieved by the drop-in.

Mr. Cox. For the record, Mr. Lodge, when you talk about these offset carrier frequencies, you refer to the fact that a frequency, such as channel 6, is not only channel 6 but can be channel 6 plus and channel 6 minus, by some minor variation in the frequency used?

Mr. LODGE. Yes. It has been found that stations operating on almost exactly the same frequency create much worse interference to each other than if they are separated by a nominal frequency of eight or ten thousand cycles. This is used in the present allocations structure to extend the interference-free area of stations. When one adds 4 stations in a signal area, it would be necessary to change from the present system that has one of 3 stations exactly on the frequency, one would be slightly higher, and the other slightly lower at the present time. We would have to devise 4 different frequencies instead of 3, if you had 4 neighbors living in the same block, as it were.

Mr. Cox. As I understand Mr. Merryman's proposal, even conceding the limited area that would be served by the drop-in—which he showed as some 310 square miles and you reduced to 150 or 285—that was necessary, in his view, in order to provide a local TV service in Bridgeport, which has a substantial population.

Mr. LODGE. I don't believe that these exact mileages refer to the Bridgeport case. He used it as a theoretical case, just as I did, to indicate the theoretical approximate effect you would get from this.

Mr. Cox. Would it apply more or less to dropping in channel 6 in Bridgeport, with existing stations operating on that channel at Schenectady and Philadelphia?

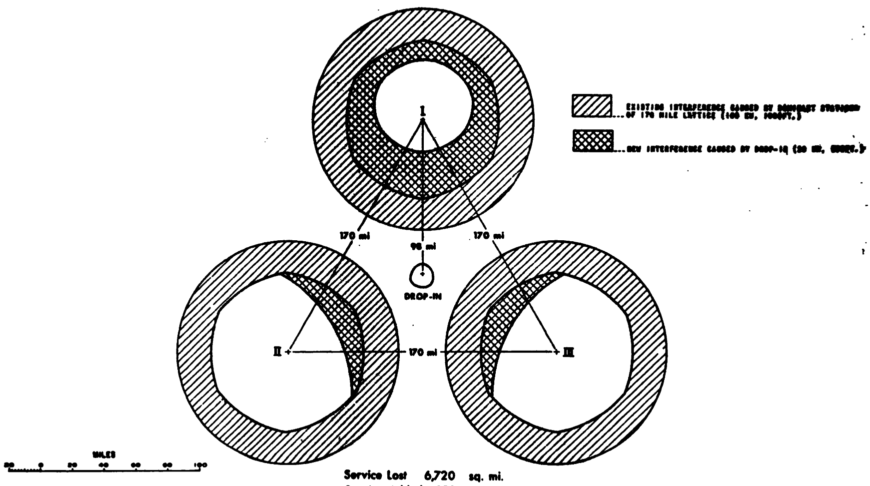
---

[2] The exhibit referred to appears on the following page.

EXHIBIT 2

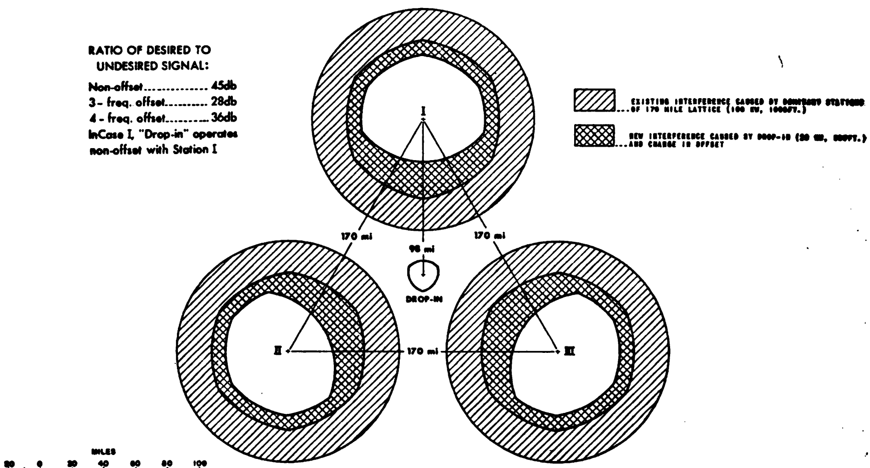
COMPUTED GRADE B INTERFERENCE FREE AREAS

CASE I - PRESENT (THREE) OFFSET CARRIER FREQUENCIES



Service Lost 6,720 sq. mi.
Service Added 150 sq. mi.

CASE II - MODIFIED (FOUR) OFFSET CARRIER FREQUENCIES



Service Lost 9,750 sq. mi.
Service Added 285 sq. mi.

CBS TELEVI

Mr. LODGE. It illustrates the type of thing that would happen on the drop-in's; yes, sir.

Mr. COX. I take it, since this is a purely theoretical proposition, then, that you have no idea whatsoever as to how many people live in these various areas described, or as to whether or not they would still continue to receive interference-free service from some other station not on the channel in question?

Mr. LODGE. That is right. This is confined to the use of a single channel and there could be a second service available. Of course, the service lost to these people might be a very desirable service. They might lose their most popular features.

Mr. COX. When the Commission adopted the sixth report, it eliminated some services by dropping in channels which created interference; didn't it?

Mr. LODGE. I don't believe that the sixth report deprived many people of television service as it went into effect. I don't recall any cases of that nature.

Mr. COX. Commissioner Bartley tells me his uncle in Texas could no longer get Oklahoma City because they put another station somewhere else in Texas that interfered with it.

Mr. LODGE. There may be cases that are out in the distant fringe, but if we confine ourselves to the reasonably confined service area, and not the very, very distant fringe, I don't believe there were very serious inroads made on that.

Senator POTTER. When you mentioned low-power drop-in stations, how low power do you mean?

Mr. LODGE. This particular example, as I recall it, was the order of 20 kilowatts at 500 feet.

Senator POTTER. What grade A service would a station like that provide?

Mr. LODGE. The order of 10 miles, 15 miles.

Senator POTTER. But their interference range would be——

Mr. LODGE. That is the point. Unfortunately there is much more interference than there is in a new served area.

Senator POTTER. It is not a matter of just lowering the power to a low area that is caught in the middle of 2 or 3 stations?

Mr. LODGE. No; if you reduce the power to the point where it would not create any interference, I am afraid you might not serve more than 10 blocks or something of that order.

Senator POTTER. Would you receive the same type of interference from a booster station?

Mr. LODGE. Boosters in general create much less interference, because I believe by "booster" you mean a very low-power booster?

Senator POTTER. Yes.

Mr. LODGE. In that case it would tend to create less interference than a station of the power indicated here of 20 kilowatts.

Senator POTTER. You may continue.

Mr. LODGE. The Hometown Television witness testified that, in this example, the "actual new interference is relatively small." Somehow, the loss of 35 to 40 square miles of existing service for each square mile of new service doesn't seem to me to qualify as "relatively small" even in cases where the loss is confined to rural and smalltown areas.

Some drop-ins would be less destructive of existing service than this hypothetical case, but the Hometown example does illustrate the danger of permitting numerous drop-ins which cause extensive interference to existing services. It will in general be true that the area of loss of service will be a large multiple of the area of service gained. Consequently, the general adoption of drop-ins not safeguarding existing services would result in a great loss of service to the public, and would violate the first objective of the allocation plan, national service. It would represent a step back to the conditions that led to the freeze in 1948.

CBS PLAN I

I come now to the CBS proposals as made to the FCC. Some witnesses before your committee have commented on the CBS plan. One witness has described it as a monopoly plan for television and has alleged that under the CBS plan all those who live outside the 100 top television markets would be deprived of all television service. I submit that an examination of the CBS plan will prove that these criticisms are unjustified and that, on the contrary, our chief motivation was to increase competition—competition, incidentally, to ourselves—in the 100 leading television markets, at the same time improving the prospects for television service outside of these markets.

CBS plan I represents an attempt to repair, within the spectrum space devoted to television in the sixth report, one of the most serious defects of the present allocation plan. That is its failure to provide at least 3 competitive stations in each of the 100 leading television markets. It seemed appropriate to inquire how far one could go toward remedying this defect by the use of VHF drop-ins without depriving any significant number of families of television services they would get in the absence of these drop-ins. The result was CBS plan I, included in the CBS proposals and comments submitted to the FCC.

The plan involves a total of 37 new VHF assignments to 31 markets. It proposes 26 drop-ins of VHF stations, 7 stations to be permitted to move from small communities to adjacent larger communities, and 4 unapplied-for VHF assignments to be shifted to markets which need them. The use of directional transmitting antennas and cross polarization is also contemplated.

Plan I would increase by over 60 percent—from 52 to 84—the number of the 100 leading television markets with 3 or more substantially competitive television stations. This increase can be accomplished without significantly reducing the service areas of existing or currently assigned stations. Thus, we believe, we have taken a significant step toward objective (*c*), multiplicity of service.

I have since studied other plans submitted in the current rulemaking proceeding of the FCC, and some of these, principally those of ABC, Storer, and station WWLP, contain features that can be used to improve plan I. Subject to these improvements, plan I, or something like it, is in my opinion the best immediate action that can be taken to relieve the allocation problem.

This plan has been sharply attacked on the basis of a misunderstanding which I hope was not willful. It is alleged that the CBS plan would take care only of the 100 leading television markets, leaving the rest of the country unserved, as a white area. Mr. Merryman testified before this committee on February 28, 1956, that—

If you live inside one of the (100) squares, you are presumed to be able to get a signal—and I guess you probably would. On the other hand, if you live in one of these white areas, you don't get any TV. Look at the size of the white areas. Look at how much of the United States is left uncovered under the CBS plan.

Probably the best answer to the charge that CBS is interested only in the 100 leading television markets and is ready to have the rest of the country go unserved is the fact that the CBS television network has affiliated with stations not in the 100 leading television markets only, but in 178 markets, covering as much of the country as we can. We have affiliates not only in Detroit and Philadelphia but in Grand Junction, Colo., and Twin Falls, Idaho, with 5,300 and 6,300 families, respectively.

Mr. Cox. Isn't it true that according to Dr. Alexander's study, neither of those communities can support a television station?

Mr. Lodge. I don't know.

Mr. Alexander. If I can reply to that, these are the number of families within the community and not within their TV market.

Mr. Cox. Just in the incorporated limits?

Mr. Alexander. These are the city limits.

Mr. Cox. Do you have any idea what the population of the service areas would be?

Mr. Alexander. I don't have it with me. I would suggest they would probably be about 20,000.

Senator Potter. We are still trying to get TV in Cheboygan. We don't have many people, but we have a lot of good country. [Laughter.]

Mr. Lodge. In fact, the CBS plans did not propose any alteration in the assignments outside the centers of the 100 leading television markets except for the 4 channels so far unapplied for and the 7 channels permitted to move toward larger cities. In all except these 11 instances, the community assignments were left unaffected. It certainly does not extend the white areas.

Our emphasis on the 100 leading television markets was a result of the fact that it was in those markets that we were proposing changes. As noted in Columbia's December 14, 1955, comments to the FCC:

* * * the imperative present and identifiable need is to increase the number of competitive assignments in larger markets.

For this reason plan I and plan II have been worked out in complete detail only to take care of urgent present needs in the 100 largest television markets. *There are currently a large number of assignments to smaller television markets and additional assignments could be made to them*" (p. 14; emphasis added).

Those markets outside the coverage areas of television stations in the 100 leading television markets and large enough to support one or more program-originating stations do not, in general, offer a serious assignment problem. Because they are situated at some distance from the leading markets they can usually be assigned channels which do not conflict with the assignments to the leading markets. These smaller markets cannot, in general, support more than two television stations (p. II-3).

Senator Potter. In other words, what you are saying in your plan here is that they should have, or try to have, at least 3 different TV stations in your first 100 markets?

Mr. Lodge. Yes.

Senator Potter. But it doesn't exclude your other markets from having 1 or 2 stations; you can't expect to have——

Mr. LODGE. Or 3 or 4, as far as that goes.

Senator POTTER. You can't expect to have 3 stations in a town of 20,000, for example?

Mr. LODGE. Well, if it doesn't take channels away from some larger market, there is no harm in assigning them there. In practice it doesn't appear they can support that many, you are right.

Mr. COX. Isn't it true that the comment that they are situated some distance from leading markets, so that channels are available, is not true in zone I, for instance?

Mr. LODGE. In general, that is correct. That was the reason that we had to make a choice in trying to apply the drop-in principles that we use in our plan as to whether we would assign a channel that could be dug up to one of the larger markets to give a third outlet there. You could possibly have it assigned to some smaller community. We thought the need for three assignments in the big markets was the important pressing one. That was our only reason for being concerned with the top 100 markets; not that we wanted to ignore service throughout the rest of the country.

Senator POTTER. You feel you could do that without taking away an appreciable amount of service in the outlying areas?

Mr. LODGE. That is correct.

CBS Plan I can make a major contribution toward realization of the multiple-service objective without any detriment to the two objectives of national coverage or community stations. Indeed, while making no direct contribution to the community station objective, it does make an indirect contribution. By providing substantially equal competitive facilities for three networks, plan I should strengthen a third network in the critical markets. By so doing, it will encourage construction in smaller markets. For it is to be noted that network service to smaller stations, to which such service is particularly important, is in fact a byproduct of a strong network service to the larger television markets.

The plan involves no cost or loss of service to the public or to existing stations. It does involve a decision to focus efforts on objective (c), multiplicity of services, rather than on objective (b), community stations. As I will discuss after an analysis of the proposal for community stations, we believe that there are most compelling reasons to justify this decision.

ADDITIONAL VHF SPECTRUM SPACE

CBS Plan I, improved by incorporation of suggestions of others, is probably a fair measure of what it is practical to accomplish within the spectrum space now allotted to television broadcasting.

Mr. COX. In that connection, Mr. Lodge, can your plan, with these suggestions which you think improve it, become a reality if the FCC continues to intermix by making grants of V's in areas which are affected by your plan?

Mr. LODGE. There are some cases where the passage of time would eliminate possibilities that we could achieve now.

Mr. COX. You propose deintermixture in favor of all UHF in Madison and Peoria?

Mr. LODGE. That is correct.

Mr. Cox. Where there is either a grant issued or a pending application?

Mr. LODGE. Yes.

Any major advance on that plan, consistent with all three objectives, requires more VHF frequencies.

The procurement of seven additional VHF channels and their devotion to television broadcasting would provide a long-run solution for just about the entire allocation problem. CBS plan II, submitted to the FCC in our proposals and comments, indicates how 3 additional VHF channels would suffice, in connection with some of the other devices used in plan I, to provide 3 or more competitive channels in each of the 100 leading markets, without exception. Four more new television channels, making seven in all, would also suffice for VHF television assignments to substantially all the cities which would be likely candidates for local community television stations. I assume that these four channels would be used for local assignments with such power and separation as to provide a service radius considerably smaller than that of standard television stations.

Mr. Cox. Isn't it true, when you say this will give you, without exception, 3 competitive channels in each of the markets, that all of those markets to which the new channels, 6A, 6B, and 6C, are allocated, would be faced with a form of the conversion problem which faced UHF?

Mr. LODGE. Yes, they would.

Mr. Cox. In other words, if you dropped channel 6A into a community which had two existing channels, the proprietor of that station would have the same problem of persuading people to spend money to convert the set in order to be able to get his signal?

Mr. LODGE. Yes. In the next paragraph I touch on that very point.

While the addition of these new VHF channels would eventually solve the allocation problem, it would do so only gradually. Initially converters would be required at a cost roughly comparable to UHF converters. Those UHF operators who have achieved good UHF conversion understandably wince at a second conversion. But the new VHF channels, unlike UHF, could be received on existing VHF antennas. The severe shadowing of UHF would be avoided. And the extra cost of a 19-channel VHF instead of a 12-channel VHF receiver should be smaller than the extra cost of a VHF–UHF receiver.

How much it will cost the public to be able to receive the new as well as the old VHF channels depends on whether the route is fast via conversion of existing sets, or slow via gradual replacement of 12-channel VHF receivers by 15- or 19-channel VHF sets. The fast route would be more expensive than the slow. The slow route is likely to be the more commonly followed. During a transitional period, existing UHF stations shifting to a new VHF channel would probably broadcast simultaneously on both channels. Entirely new stations on the new channels would usually furnish the second or third service in the market. In either case, the incentive to convert would not be strong enough to inspire any but a gradual process. Consequently, the eventual cost to the public of being able to receive the new channels would probably be low, principally because the process would be slow.

Senator POTTER. Do you think, Mr. Lodge, that the set manufacturers would start manufacturing an all-V set then to take in the new channels?

Mr. LODGE. There would have to be some indication that the broadcasters were willing to go ahead with the use of the channels, but I see no reason why, with assurance that they would be used, there would not be available the 19-channel or 15-channel, instead of 12-channel VHF.

Senator POTTER. With all the problems that we have had with UHF, I shudder to think of having another band of a super-VHF to cause consternation to the public.

Mr. LODGE. I don't blame you for that, but at least you would have a future that you could look forward to as being reasonably probable; namely, sets that wouldn't be too dissimilar from those today, performance that would be analogous to what we get on the VHF channels, and at least a sound future ground.

Senator POTTER. You think there would be more incentive to convert to one of these new VHF channels than there is at the present time to convert for UHF?

Mr. LODGE. I believe so. The cost differential in the receiver would be much less.

Mr. COX. As long as there is any differential, isn't it demonstrated pretty clearly that as long as there remain some areas which have none of these new channels, that there will be an incentive to manufacturers to manufacture sets that will receive only the existing 12 channels, and that to the extent that those sets get into the market where there are new channels on the air or provided for, that you have got the conversion problem in just about its present terms?

Mr. LODGE. Unless you can get the differential in cost between the two types of receivers so low that it is cheaper to make them all that way than to have two models, I believe you are right.

Senator POTTER. How much would it cost to convert?

Mr. LODGE. Converting would be expensive, just about as expensive as UHF; but to go into production on a tuner that had, say, 15 or 19 instead of 12—I don't have exact costs, but I would guess that it might be the order of $1.50 or $2 extra at the manufacturing level in place of the $7 or $8 it is now.

Mr. COX. And possibly to get the advantages of mass production, they would produce only all-channel V sets, even though they were going to be selling a substantial number of these in New York, Los Angeles, and other areas where the extra 3 or 7 channels would be unneeded?

Mr. LODGE. It is the only way I can see we can get small stations that can have channels to be tuned in.

Senator POTTER. How many of your first hundred markets would these channels be in?

Mr. LODGE. As I recall it, some 12 or 15.

Senator POTTER. That would be sufficient, I assume, to warrant the manufacturers to manufacture an all-V set to take care of it.

Mr. LODGE. I would hope it would; yes.

Mr. COX. Twenty-three communities, I think.

Mr. ALEXANDER. I wonder if I might be permitted to elaborate on one point, where Mr. Lodge said conversion would be about the same cost as in the case of UHF. He was referring to the set only. There would still be the differential that in UHF you have to put up a new and different antenna, while for these VHF channels——

Senator POTTER. You use your regular antenna.

Mr. ALEXANDER. Yes, sir. So the actual cost, the way it would look to a consumer, would be about half as much in this case, even if he converted immediately, because as a rough order of magnitude, half of $50 to $75 goes into the converter and half into the antenna.

Senator POTTER. Well, you may continue.

Mr. LODGE. The major difficulty in achieving this long-term solution to the allocation problem is that of actually getting the seven additional channels. I do not have information concerning the expense involved in transferring other services from VHF channels now being used to higher UHF channels. Nor is there publicly available any indication of whether the Government purposes could be as well served by the higher frequencies as by the VHF. I hope that this committee will be able to explore the conditions of availability of additional VHF channels. The complete long-term solution of the allocation problem does require, in my judgment, seven additional VHF channels.

Senator POTTER. Mr. Lodge, in the CBS report to the Commission, did you make any recommendation about utilizing some of the unused educational VHF channels?

Mr. LODGE. We did not mention that, sir.

Senator POTTER. That is not part of your plan?

Mr. LODGE. It was not contemplated in our plan.

Senator POTTER. To disturb the VHF stations for educational purposes.

Mr. LODGE. No.

Mr. COX. Your plan envisages all of the allocations in the top 100 markets?

Mr. LODGE. Yes, sir.

Mr. COX. The only impact of that would be on the educational UHF allocations in those markets and in other markets, which would quite possibly for all time be rendered useless?

Mr. LODGE. If the UHF did not develop.

Mr. COX. In other words, your plan, since it does not alter the all-time dominance of VHF in certain of the top markets like Detroit, Washington, New York, Los Angeles, and so forth, where there are no V educational assignments at present, means that no educational stations can ever go on the air in those communities?

Mr. LODGE. We had enough trouble trying to patch up the competitive picture without patching up educational as well.

THE PROBLEM OF COMMUNITY STATIONS

I come, finally, to the question of community stations. At the outset, I want to make it perfectly clear that CBS shares the desire of this committee, and the witnesses who have appeared before this committee, for a sound and prosperous system of local community stations. The ideal television system would permit the people of local communities such as Bridgeport freely to choose, with the switch of a dial and with no added expenditures for conversion, between the programs which come from the Bridgeport station and those that come from New Haven and New York.

That is the way it should be. Just as the people of a small town can read both the local paper and the metropolitan daily, and listen to both the local and the big-city radio stations, so they should be able to watch both the local and the big-city television stations.

This is the ideal. But the painful question is whether, in present circumstances, it is possible to realize the ideal.

As we have just noted, if something like 7 additional VHF channels could be procured for television use, so that 4 of them could be devoted to community stations, there would be ample provision for community stations. But if these additional VHF channels are not available, alternative approaches do not seem promising.

I have, in the testimony to this point, examined each of the major approaches which have been proposed for the solution of the allocation problem, and in each case I have tried to evaluate how close these plans bring us to achieving each of the three objectives, and the price which must be paid for the advances which might be made. As you may have noted, it is clear that the most extreme degree of deintermixture or drop-ins is required to approach the objective of community stations, and the price of the progress is so huge that they must be rejected on the ground of cost and impracticality.

Indeed, the unyielding nature of the community station problem seems at least to be implicity admitted even by the champions of the community television concept. For the proposals which they have made have been vague and changing. Thus, the Committee for Hometown Television, Inc., in its original proposals to the FCC, confined itself to the vague generality that "each station's signal coverage must be conformed to the retail trading area of its community." The committee did not specify how this objective was to be accomplished. Mr. Merryman, testifying before your committee, stated that "we do not propose that any VHF station reduce its power." He did propose VHF drop-ins which would, if generally adopted, greatly reduce not only multiplicity of service but national coverage, through their extensive and excessive interference with existing signals. The adverse effects of this line of action on the Nation's television system are so great that it must be rejected.

Some further measure of the difficulties which the Committee for Hometown Television, Inc. itself has met in finding a sensible solution is illustrated by the obvious fallacy of their most recent proposal. You will recall that, apparently disturbed by the amount of interference which their plan entailed, they proposed a scheme which is novel, to say the least. They proposed that the VHF drop-ins be permitted only if the use of the channels thus dropped in would simultaneously operate on UHF. Then, Mr. Merryman proposed, at the end of 5 years or after 85 percent conversion to UHF has been accomplished, whichever is later, the operator would be compelled to abandon his VHF transmission and operate only on UHF. At that point, existing VHF stations, whose service had been contracted because of the interference from the VHF drop-ins, would again be able to expand to their normal coverage areas.

The folly of such a proposal only underscores the difficulties of finding a proper solution to the problem. For it is perfectly obvious that dual operation would hardly encourage UHF receivers; if a viewer can receive precisely the same programs on VHF, why would he spend $50 to $100 to get those programs on UHF? That is like a prescription on a whisky bottle, directing the user to take 1 drink every 5 minutes until sober. Obviously, this is no 5-year limitation, since 85 percent conversion could never be accomplished. It is a permanent provision subjecting existing stations to excessive interference.

Still another proposal to aid the community stations would eliminate the competition of stations in larger cities by attempting to forbid the outside signal from entering the area of the smaller city. I cannot believe that this proposal for an electronic tariff wall, State by State, and community by community, can be seriously considered in a nation such as ours, where the choice of the public is regarded as decisive. I doubt that the people of Bridgeport would appreciate being barred from the 8 signals they are now receiving from New York and New Haven in order to force them to look at 1 or 2 local stations located in Bridgeport.

And, in any event, I should note that, wholly apart from the way that such a proposal would turn its back on the fundamentals of free enterprise, it would adversely affect, to a serious degree, both objective (*a*) and objective (*c*). The same effects, caused by indiscriminate drop-ins, of depriving many areas of service altogether and many more areas of the number of multiple choices they now have would result from such an electronic embargo. Thus, many people would lose service althogether. Others would have their choice of services radically reduced. For example, if the service from 8 outside VHF stations into Bridgeport were to be cut back to protect the Bridgeport station, the people of Bridgeport will get 1 or possibly 2 Bridgeport signals instead of the 7 from New York and the 1 from New Haven. Further, the 1 or 2 local stations would be ordered by the advertiser for many fewer of the popular network shows than are carried on the larger big-city stations.

I submit, as exhibit 3,[1] a chart showing the total commercial hours of CBS network programs ordered and carried in various markets. It appears that the 100th market is ordered for only about 2 out of every 5 programs for which the largest market is ordered. The fractionation of the audience that would result from cutting back the service areas of the larger stations would result not only in a reduction of the multiplicity of service, but also of the richness of service in terms of program fare.

And if it were to be decided that the service areas of the television stations in the larger market centers should be cut back in order to force-feed stations in smaller cities, there is hardly any end to the process. If Bridgeport is to be protected from New York, should not Wilson, Conn., be protected from Bridgeport, and South Wilton from Wilton? Obviously the line must be drawn somewhere. It seems to me it should be drawn where it will give the public the programs for which it has indicated a preference and the structure under which it can exercise its preference.

---

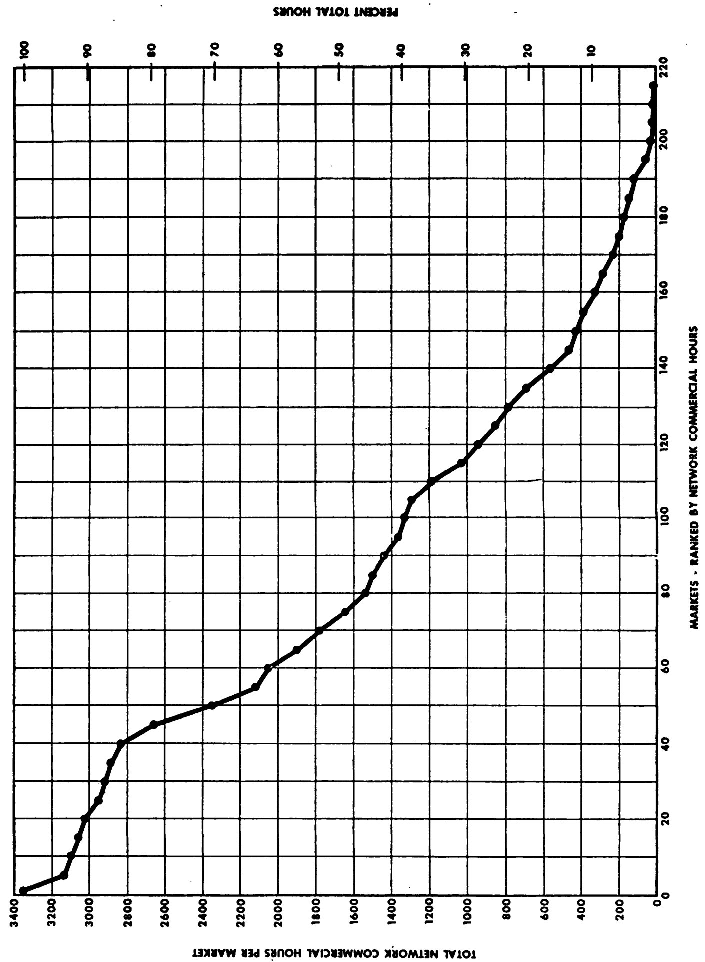
TOTAL CBS TELEVISION NETWORK COMMERCIAL HOURS FOR 1955



CBS TELEVISION
ENG. DEPARTMENT
3 - 19 - 56 E2103 - 12

Thus, it is clear that, short of additional VHF channels, no comprehensive allocation solution of the community station problem is available. Hence, CBS plans I and II were based on the fundamental fact, which I hope I have made clear in all my preceding testimony, that objective (*c*) can be achieved without substantial cost or detriment to the other objectives, while objective (*b*) can only be achieved at enormous cost and dislocation to the public, and at the expense of both objectives (*a*) and (*c*).

This is not to say that we need give up hope for some further development of community stations.

Mr. Cox. How about this, Mr. Lodge: Assuming that you are going to provide 3 competitive services in the top 100 markets, the present tendency seems to be, of course, that all 3 of those stations, their transmitters, their studios, are located in the same community, which is the largest community in the area. Would it be engineeringly possible to have the 3 V channels that you allocate to the Houston market, or to any other market, located at more than 1 community within that general market area, if there are communities large enough to deserve and to require the kind of local service that Mr. Merryman wants for Bridgeport—and all the people he brought down with him?

Mr. Lodge. By that you mean to leave the transmitters where they would still serve the major metropolitan area well?

Mr. Cox. Yes.

Mr. Lodge. I wouldn't think the moving of the transmitters was necessary. If you are going to strive to serve, say, the half million people, or however many need the service, and want to concentrate on a smaller community, that could be done within the programing of the station, but it would not require you to move the transmitter.

Mr. Cox. But it would require at least some public identification of this station with community A and of the other one with community C, so that the people in those communities would feel that they could look to those stations to provide local service in addition to the multiple network service that all three stations are providing for the area?

Mr. Lodge. Well, I am not sure I am too qualified to comment on that proposal. It would mean, of course, that the entire metropolitan area would also be required to view the local programs, as well as the ones in which they were interested.

Mr. Cox. Now they are required to view the local programs of whatever sort the stations from New York put on the air, aren't they?

Mr. Lodge. Yes.

Mr. Cox. This would give them a choice of three types of local programing to choose among; and quite probably the local programing would be placed opposite, in some cases, network service, so if they weren't interested in that they could switch.

Mr. Lodge. On this matter of programing maybe Mr. Salant might wish to comment on that. This is out of my field.

Mr. Cox. We can take the matter up later.

Senator Potter. We have a case in Michigan where the channel allocated for Flint will serve the Detroit market, and also it can serve other areas; where if the transmitter were located right in Detroit, it couldn't serve them. It would serve Detroit from the Flint area.

Mr. Cox. Aren't they trying to locate the transmitter so it won't serve Detroit?

Senator POTTER. Yes. I do not know whether it would serve Detroit from the location they are now considering or not.

Mr. Cox. If they move from south of Flint to north of Flint, they end up serving Bay City, don't they, instead of Detroit? In connection with this possibility of community service, I am impressed by the fact that you keep insisting in your comments to the FCC that this concept of drop-in V's should be limited only to the specific instances that you have included in the plan.

Mr. LODGE. Yes.

Mr. Cox. If your conception is valid, and if interference-free service can be provided in this way, isn't there a possibility that other V's could be dropped in on the periphery of some of these large markets, which would not cause interference with the local stations, but which would raise the possibility of local service in those areas?

Mr. LODGE. It is a very good point, Mr. Cox, and in going over this work, we, of course, considered that possibility. What you get into ultimately is this problem: That we cannot map out as accurately as we would like to the full extent of the service of television stations. It goes beyond any rhyme or reason, and there are people who depend on very distant areas. You mentioned earlier somebody down in Texas who had lost his service. There are a lot of cases like that. We felt that the need for a competitive service in the big markets was very great and justified making the changes we proposed, which were conservative and would protect service within any reasonable definition of it; but if the same principle were allowed to be used on a wide scale basis, and even though it did protect the roughly defined service areas, I think the end result would be real damage to the rural person who may have to get his only service from the station that may be 100 or 120 miles away. Still, if that is the only service he is going to be able to get, I think it would be wrong for us to take it away from him.

Mr. Cox. Without being critical, I think it is worthy of comment that another thing that you have emphasized throughout, normally by the use of italics, is that your proposal is not going to interfere in any way with the service area of existing stations, and that means, as Senator Potter pointed out, existing V stations—and you state that your proposal is a conservative one. Isn't it actually designed to reassure the present operators of V stations, who are your major affiliates, that this proposal is not one which could conceivably injure them?

Mr. LODGE. I would say that the real objective was not to damage service to the public.

Mr. Cox. This gets back to your colloquy with Senator Pastore.

Mr. LODGE. Yes.

Mr. Cox. In other words, you quoted Dr. Stanton, I believe, to the effect that there is no proposal which will help everybody and not hurt somebody. Your proposal is one which is very well calculated to provide extensive service, multiplicity of service in the major markets, and to preserve the present economic position of existing VHF operators, and to that extent to protect and preserve your network operation—isn't that true?

Mr. LODGE. To protect the existing service. It has the other label on it just as well. It does protect existing service, and in so doing I think it is good for us as well as the other people.

Mr. COX. That is, the one substantial addition that it makes is to provide the possibility of multiple service, and concurrently the possibility of a third equivalent network?

Mr. LODGE. That is correct. The major objective was to improve the situation for ABC.

Mr. COX. However, doesn't it put a ceiling at that point, in the absence of additional V channels, and make it impossible for a fourth network to develop?

Mr. LODGE. It would be wonderful if there were space for a fourth. Somewhere we had to ask ouselves: "How far can you go without too much damage to service?" It seemed that that was as far as we could go.

Mr. COX. In other words, your opinion is that unless we get additional VHF spectrum space, UHF cannot be salvaged to the extent that it can be made the means of obtaining a fourth and fifth outlet in major markets?

Mr. LODGE. It looks very pessimistic for it now.

Senator POTTER. In other words, if you had enough V channels for, say, the top 50 markets, could you reallocate those V channels in the top 50 markets for an additional network, with 4 networks in those top 50 markets, without seriously disrupting the service that now exists?

Mr. LODGE. No, I don't believe so. You get into a situation right here in Washington, D. C., and Baltimore, where I know of no way, with the present channels, to get 4 VHF stations in Washington and 4 VHF stations in Baltimore.

Senator POTTER. You may continue, sir.

Mr. LODGE. This is not to say that we need give up hope—I should, incidentally, return to one of my answers earlier. The excise tax, of course, does give hope that you could spread the set ownership, but barring some method by which you infuse every home with an all-channel set, I saw no very optimistic trend of the effect of using it in all markets.

Mr. COX. Even if you get an all-channel set in every home, as long as you leave 2 V's in the major markets, or 3 V's, and look to UHF for further expansion of the service, you are not going to get it because they can't compete coveragewise, quite apart from the ability to reach the set?

Mr. LODGE. I think you can take a certain amount of coverage deficiency and compete, providing you have access to 100 percent, or a large percentage, of the people who are in the central core that you serve; but if you throw in both deficiencies; namely, coverage and inability even to have all of those in the central core tune you in, then it is really a backbreaker.

As I have said, when we have a sound, competitive, multiple nationwide service, I believe that will also advance community service. And I believe that the technological and economic frontiers, as well as the frontiers of ingenuity of men like Mr. Merryman, have not yet been reached. As program sources continue to increase—and they are doing so now with remarkable rapidity—as new inventions and developments decrease costs of construction, operation, and programing, and as the community operators devote their ingenuity and energies to finding new methods of buying programs and operating their stations, I believe that there is real hope of some further growth of community stations without destroying the whole structure of television. I believe it is too soon to give up. Twenty years ago it might have been difficult to visualize the success of the operations of community stations in radio. Equally, now, it may be difficult to visualize that the same technological and programing developments and the same ingenuity will have similar beneficial results for independent community television stations. But I think it foolish and premature to believe that today's limitations are limitations for the future.

Senator POTTER. I think your conclusions restate your recommendations fairly well. It might be desirable to stop here and then when we resume this afternoon, in G–16, we can take up your conclusions at ~~that time~~ as a basis for any further questions that might be asked. The committee will be——

Mr. LODGE. Senator, before we break, I would like to return just to one of my answers, that we did attempt to show how a fourth channel could be obtained in as many as possible of the top 100 TV markets in our filing with the FCC. I forgot to answer that, Mr. Cox, earlier.

Mr. COX. However, isn't the problem there, Mr. Lodge, that you succeed in adding them in all the wrong places?

Mr. LODGE. That was the bottleneck.

Mr. COX. You get an additional service for the 8th city and 30th city, and you start with the 36th and work down to the 96th, but you leave Boston, Detroit, Cleveland, St. Louis, Indianapolis, Kansas City, Buffalo, and Milwaukee, with 3 stations, and you still leave Providence with substantially 2 stations?

Mr. LODGE. Not having any desire to do so, however.

Mr. COX. All right.

Senator POTTER. We will meet this afternoon in G–16, the regular committee room over in the Capitol, at 2:30.

(Whereupon, at 12:25 p. m., a recess was taken to 2:30 p. m.)

AFTERNOON SESSION

Senator POTTER. The committee will come to order. I want to apologize to Mr. Lodge and to the other of our guests and members of the press who have been waiting.

The Senate, as you know, is an unpredictable body. We had assumed that we would be voting during the past hour. We still haven't voted. I assume as soon as we get started the bells will ring. But I think that in order that you may make your plans for today, unless something transpires that I do not know of, we will conclude the testimony of Mr. Lodge and whatever colleagues he might have, and we will recess until 10 o'clock tomorrow.

All right, Mr. Lodge.

STATEMENT OF WILLIAM B. LODGE—Resumed

Mr. LODGE. At the recess, I had come to page 29 of my prepared statement and was about to read my conclusions, which are only about 2 pages in length.

I began my testimony with a warning against generalizations. Now, however, having examined various solutions in detail, I would like to summarize the results of our studies in a few general conclusions.

1. Of the three objectives—nationwide coverage, community stations, and multiplicity of service—the first is already substantially attained. Beyond a certain point, further progress toward fulfilling either of the two still-unattained objectives can be achieved within the presently allotted spectrum space only at the expense of the other objectives.

2. A minimum systematic deintermixture could, in conjunction with other measures, attain the multiple-service objective with some loss in the nationwide service objective, and appreciable dollar cost to the public. Very widespread application of deintermixture would be required to achieve the community objective, but this would reduce nationwide service and involve a tremendous dollar cost to the public. From a practical point of view, however, neither moderate nor widespread application of systematic deintermixture seems feasible.

3. A controlled plan of VHF drop-ins, such as CBS plan I, would greatly help the multiple-service objective by increasing the number of television markets having three or more competitive stations, and at negligible cost to the nationwide service objective. Very widespread use of drop-ins would be required to achieve the community objective, and would be counter to the nationwide service objective. Because of the adverse effect on the public, wide-scale use of drop-ins does not seem feasible.

4. Under CBS plan II, addition of three VHF channels would achieve the multiple-service objective with no loss in nationwide coverage. That objective would, of course, be achieved only after some time, not only because of delays to be expected in obtaining and assigning the channels, but also because the number of sets capable of receiving the new channels would increase only gradually. But three added VHF channels are insufficient to achieve both the multiple-service objective and the community objective. A total of some 7 additional VHF channels (with, say, 4 reserved for small-coverage community stations), would come close to achieving all 3 objectives: Nationwide coverage, multiple services, and community stations.

5. Thus it becomes apparent that whether deintermixture, dropins, or additional VHF channels are considered, the price of obtaining community outlets is much greater than the price of obtaining multiple services. It seems unrealistic to contemplate use of deintermixture or VHF dropins to the extent necessary to achieve the community objective; within the present spectrum a major increase in community stations is attainable only at too great a cost to the public. But it is possible, without appreciable cost to the public, to make multiple services available in many areas. For that reason, I believe CBS plan I was right in concentrating on an increase in competitive stations in the larger markets.

6. In addition to recommending a specific course of action which could be followed by the FCC, I believe that CBS plan I has considerable value in indicating the approximate increase in station assignments that can be made without depriving some areas of all television service. It also indicates, I fear, that unless additional VHF channels can be assigned to television, many community stations can look

75589—56—pt. 2——34

forward only to painful and possibly slow development of UHF channels.

7. Finally, since a reasonably complete long-term solution to the allocation problem seems dependent upon an increase in VHF channels, the full authority of your committee should be used to insure vigorous exploration of every possible method of obtaining such channels.

Senator POTTER. Mr. Lodge, is it your feeling that UHF is done, or dying fast?

Mr. LODGE. It is certainly not going forward, and as I said earlier, barring some step which will increase the flow of all-channel receivers into the homes, I see nothing but sliding backward from this point on.

Mr. COX. Certainly your plan doesn't do anything to actively promote the future of UHF?

Mr. LODGE. No; our plan does not, except to the extent that three networks would make—three successful and prosperous networks with more programs would help stations in the smaller communities.

Mr. COX. But those would be largely stations in smaller communities in the West where there are available allocations. They would not be small communities in zone I, where there would be nothing available for their use except UHF channels?

Mr. LODGE. With a few exceptions that is absolutely right.

Senator POTTER. What comment would you have to make on the testimony that was presented to the committee yesterday by Mr. Moore, concerning, first, option time and the other, the must-buy provision?

Mr. COX. Actually that will be discussed later.

Mr. LODGE. I am not the witness who should answer that.

Mr. COX. Dr. Stanton will be down.

Senator POTTER. I have no further questions, then.

Mr. COX. I have some.

Senator POTTER. All right, Mr. Cox.

Mr. COX. Mr. Lodge, you say, of course, that the public interest is the test in this matter. Wouldn't it be fair to say, however, that the public interest involves not just presently available TV service, but a capacity for future expansion of that service if it is at all possible?

Mr. LODGE. Yes. I would agree with that.

Mr. COX. Your plan is based upon 100 markets which would comprise the service areas of 3 stations in each of 100 major communities. How do you determine the service area of any of these stations which you have projected in this plan?

Mr. LODGE. The method is one of approximation. Some of it is engineering contours, not, incidentally, the same contours that are used in the Commission's standards, but a standard of approximately one-half the intensity used by the Commission——

Mr. COX. Which results in an increased——

Mr. LODGE. A somewhat larger service area than the Commission's coverage computations indicate. In other areas, however, where there is overlap—and we are right here in a good example between Baltimore and Washington—we would presume that the Baltimore stations are not listened to much in the city of Washington and vice versa, so a study of our map will indicate a cutting off of the service area between Baltimore and Washington.

Mr. COX. In general, then, your calculations, whether based upon actual engineering measurements or upon these computations using different values, produce service areas for VHF stations that are somewhat larger than those that would be predicted by the FCC engineering standards?

Mr. LODGE. Yes.

Mr. COX. Now, I think that you indicated this morning a possible range for VHF stations of 75 miles. What would be the maximum that you would get for grade B coverage under the FCC standards?

Mr. LODGE. The Commission's standards take into account power, antenna height, et cetera, so that there are even in existence today some VHF stations that have a B contour in excess of 75 miles. I am thinking, for instance, of those in Salt Lake City, Albuquerque, and Los Angeles, where they are located on mountaintops, where the B contour may be of the order of 80, 90, or 100 miles. These are exceptions.

In general, the difference between the contour we use and the contour the Commission would use is about 10 miles in radius.

Mr. COX. Now, I think you indicated that Florida is a desirable area for UHF. In general, would you say that the coverage of Mr. Storer's UHF station there compares favorably with that of the channel 4 station?

Mr. LODGE. In some directions it does. I have not personally observed it in some of the more built-up areas north of Miami. I would imagine in those cases there might be some minor deficiency, UHF as compared to V.

Senator POTTER. You mean because of the building obstructions?

Mr. LODGE. Yes, sir.

Mr. COX. How does your coverage of your station WXIX in Milwaukee compare with WTMJ?

Mr. LODGE. Not as favorably as Mr. Storer's UHF station compares with WTVJ in Miami.

Mr. COX. Why is that—again, buildings—or are there terrain factors there?

Mr. LODGE. There are buildings; there are terrain factors; but then you get into a very difficult area here, namely, what the public does about it. If the public buys a good outdoor antenna each time it attempts to tune in UHF, you get one situation, which is pretty generally good reception, assuming that the signal is strong and consistent. But if in a particular city the general custom is to use an indoor antenna or no antenna at all, then UHF has a tougher time than VHF does, over and above the other deficiencies, and Milwaukee is a city where outdoor antennas are not the rule.

Mr. COX. According to your computations or measurements, does WCBS-TV in New York serve Bridgeport, Conn.?

Mr. LODGE. Yes; it does serve it quite well by test, by observation, and by audience.

Mr. COX. I haven't checked your map. Do you include it within the New York market?

Mr. LODGE. Yes. It includes the Bridgeport service area.

Mr. COX. Who exactly decides what area you are going to use for station coverage, where a station is affiliated with the network? Is that basically determined by the station, or does the network make the decision as to what will be the claimed coverage of the station?

Mr. LODGE. The station is free to make any claim it may wish. In our own appraisal of how effective that station would be as an addition to the network, two groups—if you are speaking of CBS—attempt to make the best judgment they can. Our audience research group, using the data they have on popularity and amount of listening make their estimate, and the engineering department makes its estimate. We try to adjust the two.

Mr. Cox. I realize, of course, that in radio the distances are much greater, but possibly there might be some parallel. As I understand it, the AM station with which you were affiliated in Milwaukee has terminated that relationship and you now claim that your owned-and-operated station in Chicago, I believe, provides coverage for that area. Is there any parallel in TV coverage? Do you get situations where you can either say "This station provides the coverage" or "That station provides the coverage"? If so, has that affected these markets that you have outlined on your map?

Mr. Lodge. I see your point.

Mr. Cox. That is a complicated question.

Mr. Lodge. It is certainly true that, absent any CBS affiliate in a particular city that may be way out on the fringe, the effort by the listeners may be to pick up the distant station, and that if there were an affiliate in that particular community, the tendency might be for them to swing over to the local station. Certainly that is a type of consideration that comes up frequently in affiliation problems.

Mr. Cox. If you have two stations applying for affiliation which are somewhat close together, you either get a resulting overlap, which has to be adjusted between them, as far as claimed additional coverage is concerned in selling the network, or an adjustment has to be made in the location of the transmitter which will eliminate it. Is that true?

Mr. Lodge. Well, we would attempt to pick the affiliate that fitted best into our pattern. That is true.

Mr. Cox. Now, for instance, you list Spartanburg, S. C., as the 50th market. Was the determination of its service area and of the number of homes that would be served there based on the location of its transmitter on Hog Back Mountain or on Paris Mountain?

Mr. Lodge. I don't recall which one it was. I believe it would make very little difference which of the two sites was used for those computations, sir.

Mr. Cox. That is, you think equal population coverage would be attained from either?

Mr. Lodge. I think it would have swung possibly 1 or 2 counties one way or the other, but I don't believe it would have greatly affected the total service that would have been credited to that station.

Mr. Cox. Well, taking 1 station rather than the 3 stations which are allocated to the market under your plan, you would want one, I take it, that is removed to the south, so that you would not get overlap with your affiliate in Charlotte, N. C.?

Mr. Lodge. Well, either that or if there is another affiliate, another station there, we would try to ask ourselves which one would fit best in the network, and I believe it would be true that we would prefer one that did not have the maximum amount of overlap.

Mr. Cox. Even if this involved a removal of the transmitter some distance from the community to which the channel was allocated?

Mr. Lodge. Well, the station owner might make such move as he could under the FCC regulations.

Senator POTTER. Mr. Lodge, I have a vote. I have no further questions, but so the record will be complete, if Mr. Cox—if it will be all right with you for Mr. Cox to conclude with your questioning this afternoon, at the conclusion of the questions we will reconvene tomorrow at 10 o'clock. I am awfully sorry we have had this interruption, because I would like to have been here longer.

I understand Senator Bricker has some further questions he would like to have submitted for the record to be answered by Mr. Moore.[1] They will be placed in the record at this time. I know Senator Pastore had planned to be here, but he is engaged in a debate to save the Nation. [Laughter.]

Mr. COX. As far as a network operation is concerned, is it more economical and simpler, just in terms of business, to operate with relatively few high-powered stations than it would be to operate with more stations of less power, providing equal coverage, if that were possible?

Mr. LODGE. I am not sure I could answer that question categorically. It would be simpler, obviously.

Mr. COX. You would just have fewer people to deal with?

Mr. LODGE. Yes. As to the economics, I don't think I could answer that offhand; I don't believe I am the best witness for that.

Mr. COX. Isn't it substantially true that your plan I provides, first of all, substantial coverage of the Nation—85 percent, I think you said, even in these markets, plus the additional coverage in the areas you are not dealing with—and it does this with an absolute minimum possible number of stations?

Mr. LODGE. It does it with only a hundred stations, that is correct. You could predicate it with—you could imagine a network would have still fewer stations than that, but this seemed to be a very practical way of trying to do the first 85 percent of the country.

Mr. COX. Isn't it true that CBS has some kind of affiliate, or soon will have, in every one of these 100 markets?

Mr. LODGE. Certainly the vast majority. I would not want to answer on every particular one. I would have to go through the list to be sure I answered you correctly.

Mr. COX. There are 51 of them in your basic required group; there are 34 of them in your basic optional group; you have 9 more in your supplementary group (one noninterconnected), and you apparently have affiliates that are not on any of your lists in Rock Island and in Evansville. You get joint service with one or more other networks in three markets. You are due to get an affiliation with the new V allocation in Richmond. I think that takes care of the 100.

Now, my point is that both of your plans, both plan I and II, would guarantee continued availability of desirable stations for at least two networks, and an improved, but still not quite equal, availability for a third—is that correct?

Mr. LODGE. Yes. The intention was to try to get as many stations as possible in the top 100 markets.

Mr. COX. Your plan II would eliminate all use of UHF stations in the top 100 markets, and your plan I would, as I understand it, reduce your UHF affiliates from 23 to 8, of which 2 would be your

[1] The questions referred to relate to nonallocations matters and will be found under this date in the later volume on Network Practices.

owned-and-operated stations in Hartford (if that is approved) and in Milwaukee, and 6 would be stations in the 6 all-U markets that you contemplate?

Mr. LODGE. That is not strictly true. I believe there would be 1 or 2 other cities in which it would be necessary for one network or another to have a U affiliate.

Mr. COX. I am talking about CBS's position. In other words, you now have 23 UHF affiliates in the top 100 markets, I believe, and this would improve your position—coveragewise, at least—to the extent that you would now be down to your 2 owned-and-operated stations, and to the 6 markets in which there would be all-UHF service. In all the other markets there would be available 2 V stations at a minimum, or 1 V station, which you would have a good chance of affiliating with?

Mr. LODGE. Let me have Mr. Alexander check the figures.

Mr. ALEXANDER. Erie, for example, would be an exception. There might very well be some other markets in which we might continue our affiliation.

Mr. COX. I think you indicated you affiliated with the U station in Erie because it gave you less overlap than if you affiliated with the V?

Mr. LODGE. That is right. There might be other stations like that. I believe that the Lancaster-Harrisburg-York area is a similar case, too, where we would have to use a multiple number of UHF stations, just glancing through the list here.

Mr. COX. Are there as many as five, do you think, in which that would be true?

Mr. ALEXANDER. There might very well be more.

Mr. COX. There are only 4 markets in which there are only 1 V, and therefore in the other 12 markets where there is an intermixture of V's and U's, there are at least 2 V's and presumably CBS would have one affiliation and NBC the other?

Mr. LODGE. Presumably ABC has a chance to get it, too.

Mr. COX. They have that chance now?

Mr. LODGE. Yes.

Mr. COX. I think that someplace in your comments—not in your presentation this morning—you indicated that as far as individual UHF operators were concerned, some of them would be applicants for the drop-in V's that you propose, and you suggest legislation or regulation which would give them a favored status in that connection?

Mr. LODGE. I did not make that suggestion. That is one possible way in which it could be done, though.

Mr. COX. However, as I recall, there are not going to be as many facilities under this plan that are upgraded to competitive status as there are now UHF stations in existence?

Mr. LODGE. That is correct. They would not all be accommodated.

Mr. COX. This morning you were discussing this drop-in diagram of Mr. Merryman and you suggested a correction to that because of the offset operation. Isn't it true that the concept there is the worst possible degree of interference between VHF stations in zone I in that it presupposes the absolute minimum separation, whereas most of the stations actually in operation in the zone are at somewhat greater separations?

Mr. LODGE. I stated that. This was the example that Mr. Merryman used.

Mr. Cox. Himself.

Mr. Lodge. Yes. It indicated the effects of a drop-in. I indicated it was an extreme case. Others would be less than that.

Mr. Cox. I take it that these drop-in V's, while having certain very real competitive advantages over a U in the market, are not fully competitive with a full power V in the market.

Mr. Lodge. That is true, that in some directions at the closest spacings their power will be limited and they would be subject to some more interference, but I believe in all cases they would be quite effective stations. They would not be by any means a "dog" station, to use a colloquial term.

Mr. Cox. Would they provide simply a better grade of service, because they are V's within an area, or would they actually provide an area coverage that would be more nearly competitive with the full power V than is possible with a U in these areas?

Mr. Lodge. In most of the cases of the drop ins we suggested, their coverage would in most directions be quite comparable with that of a full-power VHF station. They would be restricted in certain directions by directional antennas.

Mr. Cox. Using a directional antenna they will get an elongated service area which is narrow from one side to the other?

Mr. Lodge. It will be pulled in a few miles—by that I mean 15, 20, 30 miles even—in certain directions, but I believe the service would be larger and better, and, of course, it would reach all receivers, which is not the case with the U's that are now there.

Mr. Cox. As I recall it, there are, I think, 14 markets in which these drop-in V's would be competing with 2 full-power V's.

Mr. Lodge. That sounds about right; yes.

Mr. Cox. Also, of course, your plan I recalls for 14 markets with 2 V's and 1 or 2 U's. I take it that those clearly are not fully competitive facilities, and you don't so classify them in your plan?

Mr. Lodge. No. Those are what I call the failure cases.

Mr. Cox. In other words, when you establish Louisville and Providence with 2 V's and a U, essentially that makes them, for the foreseeable future, 2 station markets?

Mr. Lodge. Except to the extent that I indicated that some of the work of others—in both of the cities you mentioned I think the ABC plan and the Storer plan had suggested other devices that might have effected a third VHF in those particular communities, so I was by no means inferring that I had all the final answers in that particular plan.

Mr. Cox. If they can find a V to put in there, it will be a drop-in V that would presumably then interfere with a V that you dropped in some place else?

Mr. Lodge. I think in both of those particular cases that would not be true.

Mr. Cox. As a matter of fact, I was interested to note that apparently the whole State of North Carolina—perhaps by accident of allocations—ends up with a series of 2 V-1 U markets, so that substantially, unless history reverses itself, that area would be dependent upon 2-network service?

Mr. Lodge. I think it would depend on the size of the market. You will recall I had another chart this morning, chart No. 3, which indicated the number of hours of network programing per market, and you will notice as you get down to the smaller markets you do not have 100 percent of the network schedule being carried in such markets. In fact, I suspect that if you get down to about market No. 90, or market No. 100, you would be pretty hard put to keep 2 stations pretty well loaded down with network business, with 3 networks.

Mr. Cox. From the standpoint of their being ordered by advertisers?

Mr. Lodge. Yes.

Mr. Cox. So that would, in effect, rather than giving simply 2-network coverage, it would give partial coverage of 3, plus local?

Mr. Lodge. Yes.

Mr. Cox. Now, your plant I calls for 6 all-U markets, and for 4 one-V and two-U markets, with, I believe you say, a total of 3.1 percent of the families in the country. Do you think that that is going to be enough to sustain UHF as a really important part of broadcasting, and to provide any incentive to further technical development?

Mr. Lodge. I indicated this morning that I thought a market of that size was sufficient to keep several manufacturers interested in trying to sell receivers in those markets, and that means developing them and having them available for sale. I don't know how much pressure there would be to improve transmitting equipment with that limited a market, so I would rather refrain from answering that question. I don't know.

Mr. Cox. I think you indicated, in answer to Senator Potter's question awhile ago, that the hopes of preserving UHF, except on this rather limited basis, are very slim. Don't you think that even this nondisruptive deintermixture that you discussed, and indicated didn't contribute much to the overall problem, would at least increase whatever benefits can be derived from this limited number of markets that you have left for UHF?

Mr. Lodge. It would certainly increase the number of islands of UHF by half a dozen or a dozen, whatever the figure was in the Storer plan. There have been several others. It falls far short, however, of meeting the community-station concept.

Mr. Cox. Well, your plan, of course, doesn't take care of the community-station concept either.

Mr. Lodge. Not unless you go to plan II.

Mr. Cox. Yes. So that if, through some deintermixture proposal such as Mr. Storer made, or through withholding additional V grants in UHF areas, you could increase the number of islands, you would have done that much more to stimulate manufacturing, you would have done that much more to guarantee a future for UHF, and at least in those limited areas you would have permitted the growth of community stations, if they were to become economically supportable?

Mr. Lodge. I believe that is correct.

Mr. Cox. I think in your second conclusion you state that deintermixture would reduce nationwide service and would involve a tremendous dollar cost. I suppose this is basically a widespread deintermixture that you are talking about?

Mr. Lodge. Mr. Storer, as I understand it, did not propose deintermixture in the sense of taking away service now on the air.

Mr. Cox. I think that is right.

Mr. Lodge. In the case of deintermixture as I used it, I meant taking stations off the air.

Mr. Cox. Well, then, would you be in favor of deintermixture in the sense of simply withholding V service where it doesn't involve eliminating stations not yet on the air?

Mr. Lodge. That is a very difficult question, and I don't think I can indicate a strong preference one way or the other.

Mr. Cox. I notice you state on page 13 of your statement that it is a close decision whether it should be modified.

Mr. Lodge. Yes.

Mr. Cox. Can you tell us any arguments against it, other than the fact that it is not a complete answer?

Mr. Lodge. Well, you always have the position of the men who have gone to the expense of going through hearings—some of them are under construction. I know of several who actually have made expenditures to build stations. They now have construction permits that have been issued.

Mr. Cox. That is strictly a personal consideration, which weighs only against the personal consideration, let's say, of the UHF operator, and which in both cases is completely subsidiary to public interest?

Mr. Lodge. You asked me if—for objections. I feel that it is kind of hard to forget the man who has fought through for 3 or 4 years to try to get a VHF, now has a construction permit, and may be under construction. If you rule that one out, I can't think of any very strong objections.

Mr. Cox. Basically, it gets down to the personal interest of the applicant?

Mr. Lodge. Yes.

Mr. Cox. Now, you indicated this morning, I think, that in a number of these areas, such as Fresno and Hartford, you thought that the bringing in of a V would provide additional coverage that is not provided either by U stations in those communities or by V stations from other markets.

Mr. Lodge. I should have included that in my answer earlier because that is a problem that is raised in all deintermixture—the price you pay in peripheral service that would be rendered. However, in the case of most of Mr. Storer's proposals, I did not include that because I believe that most of them already had one V on the air.

Mr. Cox. A great many of them did.

Mr. Lodge. Yes.

Mr. Cox. That would give at least one service in the area?

Mr. Lodge. Yes.

Mr. Cox. Now, are you familiar with the evidence in some of these deintermixture proceedings in which—at least it would appear—strong showings were made, or strong efforts were made to make factual showings that these white areas did not exist, and that therefore no additional coverage would be provided—particularly in the one case we have mentioned in the committee hearings here, the case of Evansville?

Mr. Lodge. I am sorry I have not followed those individual hearings.

Mr. Cox. As I recall it, there were uncontroverted affidavits in that case that, through actual survey, it was found that there were two acceptable signals in the areas which the V applicant claimed were white areas not served. Now, it is quite possible, isn't it, that in any fairly closely developed area, that despite the inability of the U station to reach that far, there may be usable signals coming in from other places?

Mr. LODGE. Certainly.

Mr. COX. You have tied these plans of yours in with the economics, which certainly provide a sound basis, but isn't it true that plan I doesn't even provide for as many competitive stations in these top markets as Dr. Alexander says they can support?

Mr. LODGE. Mr. Alexander is here.

Mr. ALEXANDER. It is true. They make a step in that direction. They do not go the whole way.

Mr. COX. In other words, as I recall your tabulations, you felt that 3- and 4-station markets could support 422 stations, whereas I believe your plan I provides for 323—but some of which are U's in 2-V markets which would have a very limited life.

Mr. ALEXANDER. That is approximately correct, although 24 of those 422 are beyond the hundred leading markets, so the hundred leading markets, naturally—these figures shouldn't be taken to the last digit anyway. The hundred leading markets can, in that computation, support 398.

Mr. COX. Also, I think that you indicated that there were 78 communities which could support 4 stations.

Mr. ALEXANDER. That is right, 4 or more; the first 20—and that is a very rough estimate, rougher than the others—I presume could do with more than 4.

Mr. COX. Actually, plan I provides for 4 or more channels in only 12 of those, doesn't it?

Mr. ALEXANDER. I don't remember the exact number, but far fewer than could support it. That is why, in the submission to the FCC, there are these two appendixes—I believe, appendixes 7 and 8—which indicate, under each of plan I and plan II, how much further you could go within those plans toward 4 stations in each of the 100 leading markets. As you pointed out, many of the hardest cases occur in the top, not quite the top markets, because you can make New York and Los Angeles—Chicago already has 4—but just a little bit beyond that, you start running into trouble until you get down to about, I think, the 26th.

Mr. COX. The 26th.

Mr. ALEXANDER. That is, again, under the initial assumptions that Mr. Lodge made, that certain other assumptions that ABC made, for example, or others, might permit a few more markets, through moving in stations, and so forth, that we did not assume. There is a good deal of flexibility in smaller modifications, naturally, of these plans.

Mr. COX. Your plan, of course, is obviously and quite frankly designed to provide for the possible development of three nationwide networks of a fairly competitive character?

Mr. LODGE. That was our objective.

Mr. COX. I take it, though, that except for these possible fourth stations that could be put into some of the smaller markets, that your feeling is that with the present number of VHF channels available—and having substantially written off the UHF channels, except in a limited number of instances——

Mr. LODGE. Excuse me, to the extent that the excise tax might be dropped and ultimately give a means of getting UHF tuners in all homes, that hope I have to hold out.

Mr. COX. With those reservations, this is just about as far as you can go, and having gotten these three networks, the possibility of a fourth, the possibility of the development of substantial independent stations which would provide an outlet for independent program sources, those are quite remote?

Mr. LODGE. I am afraid that is the straitjacket we are in.

Mr. COX. I am interested in what our TV system would look like outside the 100 top markets. You made this morning the very valid point that you certainly have not denied television service to the areas not covered on your map, and I think if you check our hearings, you will find that that point was clarified at the time Mr. Merryman made it. What is going to be the situation outside of these 100 top markets? Will there be 166 competitive assignments that will be available to take care of the 1- and 2-station markets that Dr. Alexander says can support that many stations?

Mr. LODGE. I don't believe there is any great shortage of channels in the smaller markets at the present time, but how great that would become in the future is something only the future can tell. It could be there would be demand for a very, very large number.

Mr. COX. I think at this point, maybe, I had better ask Dr. Alexander what it is exactly he means by one of these markets. You indicate in your tables that there are only 217 markets with the necessary minimum 22,000 homes which can support TV stations. Does this mean that there are only that many which are within the range of a strategically located TV transmitter?

Mr. ALEXANDER. No, sir. The basis—and you can, as I said before, change the figures around by varying definitions by 5 or 10 either way—but within that margin, for variation, with differing definitions these markets were determined, first, by going over the list of all station points for which an application had ever been made, determining how many families were within various distances of such points, and not within the corresponding distance of points higher on the list.

In short, the concept of that last point is that the word "unduplicated" should really be before the statement that this includes all station points that can bring in 22,000 or more "unduplicated" homes, so that the principle—that word "unduplicated" is the principal factor which brings about that point, which is what one starts with if you start with th e continental United States and the allocation plan, down to something in the order of 350 points. When you take those 350 where applications have been made, you then will shrink further by the so-called overshadowed points, leaving you substantially, and depending on how you define it, 220, let's say, 220 points, which are neither overshadowed nor have fewer than 22,000 families in their service area, defining again, there was one characteristic that I may point out that in defining overshadowing, I permitted any smaller station to have duplicated families that were more than 50 miles from the primary service point.

In other words, just not to incur an error there, I assumed that a station in a smaller community would have a fair share of families that were within its service area that were closer to it and outside the 50-mile range of a larger station, even though possibly covered by the larger station. That is a special quirk of TV, but it gives you some idea of the basic philosophy involved in making that estimate.

Mr. Cox. Would it be fair to say that there are a good many communities, in the conventional sense of the word, which are large enough to support a television station by your standards, but which are not considered by you because of the fact that they also fall within the possibility of coverage from a larger population point to which you then allocate the three stations?

Mr. Alexander. Well, I think that if I may state that a little bit differently, I would say that my interpretation of the economics of television today is that a station that covers let us say 50,000 families, all of which were well served from another larger station point, will not have an economic chance of survival. That is the point that I indicate. I do not indicate that some time in the future such stations will not. This goes both for VHF and UHF, incidentally. Remember, Mr. Lodge made the distinction that three different circumstances can operate to prevent a station from earning profits. One of those was the competitive disadvantage of UHF; the second was overshadow, and even if you take it independently, you may find places like St. Cloud, Minn., where VHF is assigned, where even by my computation that place could support a station, but the applicant has dropped his application because I believe he was convinced that he probably couldn't, because he is right on the edge of service from another larger station and felt that that competition would be too keen, so that to cut down in the number of communities from the 1,240 down around to my 220 includes this factor of the so-called overshadowing effect.

Mr. Cox. Isn't it true that the reason you say that this community, of sufficient size in and of itself to support a station, is not economically feasible is that it is not economically feasible for support through national advertising because the national advertiser will not buy that station if he can obtain coverage from New York?

Mr. Alexander. That is not the reason why I selected it. That may be an explanation. That is an inference that may be drawn. I selected it merely from an empirical study of where stations could survive and where they could not. In other words, it is a much more difficult analytic problem to ask whether the support or failure of support of a station in St. Cloud was because national advertisers were not forthcoming.

I will say local advertising in TV, as in radio, is slower in coming than the other. At some time in the future perhaps this difficulty may be surmounted. I am not in the position to say it is only because of national advertising not being forthcoming that these overshadowed stations cannot do well. I think that there are a number of them which have VHF's. They might be able to say why they are having trouble. One of their reasons certainly will be because of a shortage of national advertising. I presume another one will be—and this is a presumption—that local advertisers or national spot advertisers, as well, are not attracted to the station unless there are some national programs there to attract the audience first. In other words, there is a value to adjacencies. There is a whole complex there which is very difficult to analyze, naturally, which would prevent these stations from being as commercially successful as those.

Mr. Cox. Since it is overshadowed, the network doesn't affiliate with the station in that market, and therefore the national advertiser on a network basis never gets a chance to buy that market independently. He can only buy the larger market which is served by the metropolitan station?

Mr. ALEXANDER. That would be one consequence of not being affiliated. If affiliated, it would be doubtful if many advertisers would want it, which is the basis why, in the individual case, it would not get its affiliation.

Mr. Cox. Isn't it true that at the present time there are, aside from the stations in your top 100 markets, only some 160 program-originating stations in the country, as against the 166 that Dr. Alexander says can be supported in 1- or 2-station markets, so that unless your plan includes some method of survival for these, a good part of which are UHF stations, it is actually going to reduce service below the supportable levels, or at least provide no remedy that will preserve service fully to the extent that seems economically supportable?

Mr. LODGE. I think Mr. Alexander ought to reply to that more than I would. I would like to point out some you are speaking of are undoubtedly in the overshadowed areas and not in the distant areas, a number of the stations.

Mr. ALEXANDER. I am not sure I got your question. I would certainly not say that Mr. Lodge's plan would reduce any station. I think what the content of your question, as I understood it, is that the sixth report assigned channels to certain communities, and application have been put in for those channels where the present economics will not support stations. I mean I think there has been ample testimony before this committee and elsewhere to indicate that that has in fact transpired. In short, there is a problem in some communities of supporting a station; yes.

Mr. Cox. However, by your concentration on the development of 3 V stations in the top 100 markets, don't you doom, perhaps, a station in an overshadowed market which can survive as long as it doesn't have multiple competition from outside?

Mr. ALEXANDER. Well, frankly, I just don't know the answer to that, but if you want my opinion, you are asking: Will a station in a small community served by 2 VHF's from a large adjoining community be able to survive, but not if there are 3 VHF's in that large one?

I would say that my general feeling would be that there would not be a significant difference in such a case, where it is really an overshadowed market; that frequently 1 VHF is enough to overshadow a UHF station, and that the difference between 1 and 3 is not likely to be as significant as your question would imply. But, again, this is just an opinion; there aren't enough cases in which you can test that empirically.

Mr. Cox. Do you think Enid, Okla., is an overshadowed area?

Mr. ALEXANDER. I would have to check.

Mr. Cox. What you propose to do is to move the VHF station that is now in Enid to Oklahoma City. Now that clearly deprives Enid of a community service. It, I assume, does not give Enid an additional service because it is already served from the two Oklahoma stations.

All it does is to provide a multiple service for a slightly altered geographic area; isn't that true?

Mr. ALEXANDER. That is true. That is Mr. Lodge's question.

Mr. LODGE. That is absolutely right. It would shift from a community service station to one serving a much larger population.

Mr. COX. I assume this, of course, will be welcome to the owner of the station, but perhaps not so welcome to the people who live in Enid or in Eldorado, Ark., or the other places where you propose to move these?

Mr. LODGE. That is presuming they don't want the programs; they would get them on the Enid station after they move. I am not sure you can make that assumption.

Mr. COX. In other words, you don't think the desire for a local TV service is equal to that for network service?

Mr. LODGE. No. I don't quite see that you could conclude that the programs are not acceptable to the people after the move.

Mr. COX. Is it likely that a station located in Oklahoma City will support community projects in Enid, Okla., as well as one that is physically located in Enid?

Mr. LODGE. It would depend on a lot of things. If the station now signed on at 4 p. m. in the afternoon because they couldn't carry a very extensive program schedule, and if it ran 16 hours a day after the move, it could well be it would be better.

Mr. COX. Do you know, Dr. Alexander, whether there are any cities with less than 22,000 homes which now have television stations which are operating at a profit?

Mr. ALEXANDER. First of all, I want to point out that these are not cities of 22,000 homes. These are television markets. This is a very important point because a number of critics of my paper have frequently used that error to make it seem as though many cities with fewer than 22,000 homes would not have stations, when in fact they would, because their market would have 22,000 homes, so that I don't know, I don't know of any individual cases. You see, I work largely from statistics which are made public by the Federal Communications Commission, which do not reveal the individual station's operation. They are very careful not to reveal that.

Mr. COX. Do you know whether Grand Junction, Colo., or Twin Falls, Idaho, are buried someplace within the one-station markets that you calculate can support stations?

Mr. ALEXANDER. No. I can tell you by looking up my records whether these stations are computed by need to support. I am quite sure they can. They are able to, even though they are such small communities. They can go out 75 to 100 miles. When you draw a 100-mile circle that is a very large area, even is those States where the density of population is low. But I would guess, however, that—I want to make clear that my computation was designed to try to get the number of stations and not to apply to any individual instance. There will be instances, I am sure, where a community whose total TV area contains possibly 10,000 homes, it might make a go of the station—another one with 30,000 might not.

This was taken from an average relationship, which says essentially that, if you cut off at 22,000, you will have as many communities above it that cannot as you will have below it that can, so that it is an average relationship; and like any other average, it is made up of a composition of different quantities, so that I by no means want to be in the position of saying that no community with fewer than 22,000 families within, let's say, 75 miles, if it is a VHF station point—I do not want to say that no such community can support a station. What I want to say is, if you tally all such communities, you will find that as many of them can as cannot, so that that is the line which would give you the best estimate of how many, in fact, can support a station.

Mr. Cox. You indicated, I think, this morning, Mr. Lodge, that CBS is affiliated with 178 stations, or some number in that neighborhood.

Mr. Lodge. One hundred and seventy-eight markets. It is a larger number of stations than that.

Mr. Cox. In any event, in excess of the hundred markets that you are dealing with here. I take it, though, that presently and in the future, until those markets grow in size, the affiliation they get is of a lower order in terms of both revenue and programing than that which would be possible in the top 100 markets?

Mr. Lodge. Well, that, of course, is what the advertisers buy, and not what we limit them to artificially, or in any way.

Mr. Cox. In other words, you are going to be providing network service outside these 100 markets, but not on the same basis that it might well be feasible to supply it within the 100 markets?

Mr. Lodge. No. We actually have the same service available within and without. The number of hours per week of programing that a particular station gets flows from the desire of the individual advertiser.

Mr. Cox. As I understand this third exhibit you had, as you go down the scale, even within the top 100 markets, you decrease the number of hours that are ordered on these stations, and that that would extend well beyond the 100 markets, so that unless they get service through your program extension plan—is that yours or is that NBC's?

Mr. Lodge. Extended program service, I believe, is ours.

Mr. Cox. Extended program service. Unless they get benefits in that way, the network service that they get is on a more limited basis than that which is attainable in the top hundred markets?

Mr. Lodge. Yes. You said in asking the question, "You limit the number of hours," inferring that we limited the number of hours. That is not the case. It is the advertiser who does not buy.

Mr. Cox. I didn't mean that. The service that is made available, even though you are perfectly willing to provide it——

Mr. Lodge. And anxious to.

Mr. Cox. Is limited by the advertiser's willingness to buy these markets that are outside the hundred markets that you concentrated on here for your three services?

Mr. Lodge. Yes.

Mr. Cox. I notice that in your comments, although not in your statement this morning, you made a suggestion for further increasing the height of antennas in zone I. Do you still feel that that is desirable?

Mr. Lodge. I feel it is a desirable thing. I believe it would reduce the white areas in the country some.

Mr. Cox. By increasing the service area of the presently existing V's it will also increase the area of overshadow and also it will possibly reduce the future service areas of the drop-ins that you contemplate?

Mr. LODGE. It would have all of those effects. I believe that the magnitude of either the improvement, on the one hand, or the damage in the cases that you mentioned is greatly exaggerated. As far as I personally am concerned, I do not believe it makes an awful lot of difference whether it is or is not adopted.

Mr. COX. You urge your plan II for the long range because you feel that the addition of a minimum of 7 V channels is perhaps the only solution that would permit the achievement of all 3 of these objectives that you have been discussing. Now that, I take it, would involve no loss in service, but it would involve dollar costs to the other services of a magnitude perhaps even greater than some of the costs that you outlined, but that this is a cost which would be borne by the viewer as taxpayer rather than as the owner of a TV set—doesn't it amount to that?

Mr. LODGE. I indicated carefully in my testimony I had no direct knowledge of what these costs might be. It could be the costs are too great to be considered. I do not know.

Mr. COX. That is, quite clearly there would be a problem of relocation of services and the purchase of, in some instances, quite different equipment to permit the same thing to be done that is now being done on the VHF channels that would be necessary for this plan?

Mr. LODGE. That is the area in which we are not in good position to inquire, and I believe your committee is in much better position to find the facts.

Mr. COX. Thank you very much, Mr. Lodge. I am sorry we have kept you all here so late in the day. We will convene in the morning at 10 o'clock in this room and hear Mr. Heffernan.

(Whereupon, at 4:32 p. m., the committee adjourned, to reconvene Wednesday, March 28, 1956, at 10 a. m.)

TELEVISION INQUIRY

(UHF-VHF Allocation Problem)

WEDNESDAY, MARCH 28, 1956

United States Senate,
Committee on Interstate and Foreign Commerce,
Washington, D. C.

The committee met, pursuant to adjournment, at 10 a. m., in room G-16, The Capitol, Washington, D. C.

Present: Senators Pastore (presiding), Schoeppel, and Potter.

Senator Pastore. The hearing will come to order.

Our first witness today is Mr. Joseph Heffernan, vice president of the National Broadcasting Co.

STATEMENT OF JOSEPH V. HEFFERNAN, VICE PRESIDENT, NATIONAL BROADCASTING CO., INC.; ACCOMPANIED BY WILLIAM DUTTERA, MANAGER, ALLOCATIONS ENGINEERING, NBC; DAVID ADAMS, VICE PRESIDENT, NBC; THOMAS ERVIN, VICE PRESIDENT, NBC; JOHN SONNET, COUNSEL; AND JAMES GREELEY, COUNSEL

Mr. Heffernan. Mr. Chairman, members of the committee, my name is Joseph V. Heffernan. I am a vice president of the National Broadcasting Co. I appear here at the invitation of the committee to furnish information with respect to the frequency allocation phase of the committee's hearing.

At the outset I want to express to the committee NBC's appreciation for affording us the opportunity to come before you and state our position. We believe this hearing can serve a constructive purpose in developing the facts relating to UHF television, its potentials for public service if rightly handled, and the large measure of its promise which can be lost to the public if not so handled.

TV ALLOCATIONS AND THE SIXTH REPORT

We believe the Chairman of the Federal Communications Commission stated the fundamental issue at stake in the allocation of frequencies to television broadcasting when he said in December:

> Basically at issue is how widespread a service can television become? (The Dynamics of a Dynamic Industry, an address at the Poor Richard Club, Philadelphia, Pa., December 6, 1955 (FCC 26209).)

We believe that full utilization of the 82 channels now allocated for television—the 70 UHF channels and the 12 VHF channels—offers the best prospect for the growth of television as a nationwide competitive system. This is the objective of the Commission and a goal which NBC strongly supports.

In the notice of proposed rulemaking for its current frequency allocation proceeding—FCC Docket No. 11532, instituted by notice of November 10, 1955—the Commission stated that the objectives of the sixth report and order issued in 1952 were:

(*a*) At least one service to all areas.

(*b*) At least one station in the largest possible number of communities.

(*c*) Multiple services in as many communities as possible to provide program choice and to facilitate competition.

As a means to fulfill these objectives, the Commission allocated for television service the 70 UHF channels in addition to the 12 VHF channels.

Since the time the Commission's sixth report was issued, RCA and NBC have aggressively acted to improve transmitting apparatus, receiving apparatus, and television transmissions at UHF to assist in the expansion of the television service contemplated by the Commission's order. As a result of these actions advances have been made in the technical performance and in the techniques related to both VHF and UHF operation and experience have accumulated on the matters relating to television broadcasting encompassed by the sixth report.

In the allocation proceeding currently pending before the Commission a variety of proposals have been made suggesting changes in the allocation plan adopted in the sixth report. We have submitted comments in that proceeding suggesting measures we believe would be helpful in maintaining and strengthening the UHF service. We have taken this approach because we believe that the effective use of the 70 UHF channels, together with the 12 VHF channels, offers the best prospect for encouraging the growth of television as a nationwide competitive service.

In his testimony before you, Dr. Engstrom of RCA discussed allocation considerations against a background which he presented relating to technical development in the UHF field and the contributions to that development made by RCA and NBC. I shall deal with allocation considerations as they relate to broadcasting. In doing so I will refer to steps which can be taken now to help the situation and will indicate what we believe are limitations in some of the proposals advanced by others.

ACTION WHICH CAN BE TAKEN NOW

We believe that each proposal which offers promise of significant improvement in this field should be thoroughly and carefully evaluated by the Commission, so that it can develop a broadly based plan of affirmative action. This will take time, since it calls for considered analysis and resolution of detailed issues and for decisions based upon the long-range implications of these issues.

There are, however, some actions which relate to UHF which Congress and the Commission can take at once. While no single step taken now offers a magic solution, the actions we urge will help significantly in realizing the potential of UHF.

I shall state first in outline form the nature of the actions which can be taken now, and then I will discuss them in greater detail.

The Congress can:

Declare as national policy the goal of maintaining and strengthening the UHF service, in order to encourage the continued development of television on a nationwide competitive basis.

In aid of this policy, repeal the excise tax on all-channel color receivers. This would progressively relieve the circulation handicap which has been the greatest single drawback to UHF development.

In order to facilitate a Commission policy of deintermixture in implementation of this policy, the Commission should be in a position to permit the holder of a VHF grant to receive, without further proceedings, a grant for a substituted UHF channel resulting from deintermixture. If the Commission believes there is substantial question of its authority to follow such a course, Congress should enact the necessary legislation.

Senator PASTORE. On this very point, what do you think of the suggestion that has been advanced by some individuals that a possible solution along the first point your raised might be a resolution to the effect that all color TV broadcasting should be on the UHF band? Where woud that lead? Would you want to make a comment on that?

Mr. HEFFERNAN. Yes, sir, Mr. Chairman. I am afraid that would lead to stopping color broadcasting, because color has not had an easy time getting off the ground, although it is now coming along fairly well; and the stations which, for the most part, are doing color broadcasting are the VHF stations, and if you limit it to UHF, there would be very few stations at the moment who could broadcast in color. It would just stop color in its tracks.

Mr. COX. There is considerable expense, is there, in connection with equipping a station for color broadcast?

Mr. HEFFERNAN. Not, Mr. Cox, to broadcast network color.

Mr. COX. But to originate their own?

Mr. HEFFERNAN. To actually pick it up in the studio does involve considerable expense, but the networks—that is, NBC and CBS—are equipped to do that at considerable expense, but once we feed it out to a local station, affiliated, there is relatively little expense involved in that station modifying its transmitter so that the transmitter will feed out the color signals, because that is all it has to do.

Senator PASTORE. Its progress in its development will be measured in terms of the quality and quantity of distribution at the broadcasting point, the local level?

Mr. HEFFERNAN. That is correct.

Mr. COX. The problem, actually, for color now is the sale of color sets so that color TV programs that are made available will have an outlet?

Mr. HEFFERNAN. Yes. It is a circulation problem.

Mr. COX. You feel, therefore, the best use that could be made of the shift to color would be to have all those color sets as they come into the market all-channel, if that can be encouraged through tax policy?

Mr. HEFFERNAN. I do, Mr. Cox. I discuss that in some detail later.

The Commission can:

Deintermix on a sufficiently broad basis to create a nucleus of predominantly UHF service areas from which UHF may grow and expand.

Encourage multiple owners with resources and know-how to undertake the operation of UHF stations in intermixed markets.

Encourage other qualified persons to undertake UHF operation in such markets.

Permit UHF stations to use directional antennas.

Permit UHF stations to use on-channel boosters and translators to more nearly equalize coverage with their VHF competitors.

Permit UHF stations to us 5 megawatts of power as an additional means to improve their competitive position with VHF.

REPEAL OF EXCISE TAX ON ALL-CHANNEL COLOR RECEIVERS

In the past 2 years active consideration has been given, with this committee's support, to the repeal of the excise tax on all-channel receivers. That would be black and white at this stage. The removal of this tax would have made such receivers competitive in price with VHF-only receivers and would mean that the circulation handicap under which UHF has labored would progressively diminish.

A more limited approach to excise tax relief is now proposed. This would provide such relief for all-channel color sets.

This limited proposal would mean little revenue loss to the Treasury at this time. It therefore avoids the principal basis on which the Treasury has opposed tax action while maintaining the compelling considerations of national policy which support tax relief for UHF. At the same time, it aids the development of the new industry of color television.

If all television sets now in the hands of the public could receive all UHF stations, as they can receive all VHF stations, it is safe to say we would not be here today. There would still be some technological differences in the extent and nature of coverage between a UHF and VHF station, but these differences would not present a fundamental obstacle to the maintenance and growth of UHF as a basic part of a national television system.

The obstacle to the development of UHF as an extensive national service is the circulation problem, which arises from the fact that in many intermixed markets only a portion of the sets can receive UHF while all can receive VHF. If the excise tax were removed on all-channel color receivers, it is reasonable to believe that all color receivers would be equipped at the factory to receive all channels. Thus, as color sets replaced or supplemented black and white sets now in the hands of the public, there would be a progressive growth in UHF set circulation on a national basis.

There is every reason to believe that color TV is at the threshold of rapid development. Taking NBC alone, the volume of color programing broadcast on the network during the current season is five times the volume of our color schedule during the past broadcast season. And for the coming broadcast season of 1956–57, commencing this fall, NBC is pointing to the goal of color programing every evening.

In addition, our Chicago TV station is being converted to color 100 percent, so that commencing just 3 weeks from now, all of its local programs which are regularly broadcast live will be presented in color.

With network color programing growing in frequency and volume, and with the growth in local color programing on the part of stations equipped to originate color, color set circulation will be stimulated to grow at a cumulative rate.

Exercise tax relief for all-channel color receivers would therefore mean that the growth of UHF set circulation would be directly associated with the growth of color sets. If the growing circulation of color sets becomes also available for UHF, which would follow from the excise tax action now proposed, this would be a vital contribution to the preservation and development of UHF.

If such tax action were taken now the very prospect of this progressive increase in UHF circulation would give a big lift to the development of UHF. There would, of course, be some revenue loss, but there are these points which heavily outweigh the loss.

In the first place, we should consider the tremendous help which excise tax action would give to the preservation of UHF as a critically scarce national resource, since it is only through the preservation of UHF that the Nation can have the extensive television service it needs and deserves.

This point depends in turn on the complexities of frequency allocation and frequency scarcity which are understood by this committee and the Commission by reason of their long experience in such matters, but it is not reasonable to expect that other Members of Congress and the executive branch of the Government would have anything like the same background in this area, and without it, are not in a position to realize the vital public considerations which establish the need to help UHF.

We refer to public considerations favoring excise tax repeal because they are and should be stated as public considerations. The relief is not sought to help manufacturers. Nor is it sought to help broadcasters as such. It is sought to help the public get the kind of television service it can get in only one way—the preservation and use of UHF.

I might say here that the discussion yesterday was helpful in clarifying that point, I believe, and I think the position of CBS is to be admired in the clarity and forthrightness with which they brought out that their proposals to develop three V stations in more big markets could be at the expense of the desirability of having more community stations in smaller markets.

They were forthright in that position and they therefore helped clarify the situation. Our position is a different one. We feel it practical to attain both objectives.

Senator Pastore. Don't answer this question if you do not want to, but what is your feeling with relation to the number of stations in New York City? Don't you think you are overloaded in New York City?

Mr. Heffernan. I should like to say, Senator, in respect of that, that New York City is allocated 1 station per 2 million people in the metropolitan area. I know of no city that has so few per people involved. I know of no city of 2 million people that has only 1 station.

Senator PASTORE. Is it fair to measure it that way? Do you mean that for equitable distribution you have got to have a certain number of stations per people? Isn't it really the number of channels that may be available to any one person really an equitable way of measuring it? In other words, as a whole, people in New York City—any 1 patron of TV can turn on 7 channels. Yet you come to Providence and the best you can do is to tune in two channels. Why should the individual in Providence be deprived of the facility of seeing the third network shows at all times, and yet the person in Washington and the person in New York have the availability of so many different channels? I mean I do not see how you are going to effect an equitable distribution based upon so many channels per millions of people.

Mr. HEFFERNAN. Mr. Chairman——

Senator PASTORE (interrupting). Because it actually works out to a denial of overall availability to people in other parts of the country. I realize the sixth report set down as priority No. 1: "We will give at least one station to everybody." That is admirable as far as it goes, but as long as you have other people enjoying 7 channels, you are not going to get much content from people who are going to be confined to 1. In time there is going to be a little howl on the part of those people, and it is to be expected.

I don't know, technically, how you are going to unscramble it. I am not getting into that. I think basically the trouble started—of course it is easy enough to realize how we did start—but that is basically, I think, back of the trouble in New England where you have such terrific concentration in large cities, namely, New York, that raises havoc in making new assignments in parts of New England. Do you disagree with me?

Mr. HEFFERNAN. I do not disagree with your analysis of it as it relates to present operative stations in Providence. It was the intention of the Commission, the objective of the Commission—and it certainly is an objective we strongly support—that Providence should not be limited to two stations. Providence should have more than 2 stations, and if our proposals, and the action of this committee, and the Commission, and Congress would make UHF go and succeed, Providence will not be limited to 2. Now I would say this: That if, however, we are remitted to a system under which we have only 12 channels for TV broadcasting, as compared with 106 for AM broadcasting, and 100 for FM broadcasting, 12 marbles are not enough to play the game with and have the kind of a distribution that various communities deserves—12 channels are not enough. The Commission realized that from the start. I think everybody realizes it. If you have 82 channels you can do the job. That is why, in our view, it is so important that UHF be preserved and strengthened so that we can play this game with 82 channels and not with 12 channels.

Senator PASTORE. What do you have to say on the argument that has been raised here continuously with reference to the superiority of the VHF channel over the UHF channel in that there may be some places, like behind a hill or what have you, where you do not get such clear reception on UHF as you might get on VHF?

Mr. HEFFERNAN. Well, Mr. Chairman, Dr. Engstrom—I am not a technical man—Dr. Engstrom testified for RCA in respect to the technical aspects, and I stand on his testimony 100 percent. As I understand it, again, we must distinguish between today's circumstance and tomorrow's circumstance and developments. VHF has been commercially authorized and in operation for 15 years; UHF, less than 4 years. Now there is bound to be a distinction, if we can take a human analogy between the performance of the 15-year-old and a 4-year-old, and I do not imply the analogy, like all analogies, is perfect; but UHF should—and it is expected by the technical people—improve its relative performance. I think it fair to face right up to it that as of today there is a difference.

Senator PASTORE. What do you have to say with reference to the expressed attitude of some of the members of the Commission—and I think it is the majority viewpoint—that they should go on carrying out the spirit of the sixth report and order in allowing intermixture, with the understanding that if later on it becomes advisable to deintermix, that they would deintermix at that time. Do you think that is going to work out?

Mr. HEFFERNAN. They have announced that policy, and most of the grants which were in contest on the basis of that have been made so that the point is somewhat academic now. The Commission is in the position that they are either going to deintermix in respect to those grants already made or they are not, and we are past the point of whether they should be granted. They have been granted.

Mr. Cox. There are still a few pending.

Mr. HEFFERNAN. I think that is correct.

Mr. Cox. Don't you think the point posed by Senator Pastore will be very clearly raised as to whether this view of the majority is realistic, that they can make the grant and then, if at a later time they decide that they want to deintermix in Madison or Fresno, that they can reverse their position?

Mr. HEFFERNAN. There is no doubt they have the power to change it. It may be, from a practical standpoint, more difficult to do so.

Mr. Cox. In terms of the remedies available to the grantee, it may take some time to do so?

Mr. HEFFERNAN. It may take more time than if they had not done so. We discuss deintermixture. I will come to it. We are for deintermixture.

Senator PASTORE. I know you are. The thing that is troubling me is whether or not there is going to be any chance at all—I am speaking now of black and white. I agree with you on the suggestion that you have made with reference to this excise tax on color TV, but speaking now of black and white, do you see any immediate solution to the problem, really?

Mr. HEFFERNAN. I would say this, Senator—you mean to help UHF?

Senator PASTORE. Yes.

Mr. HEFFERNAN. I would say——

Senator PASTORE. I mean I am afraid, Mr. Heffernan—and I am not going to push you any more than anybody else has been pushed—but I am convinced that we are more or less kidding ourselves about this. Everybody skirts around this problem, but no one comes out and directly says "Look, let's face it." If you are going to keep on intermixing, because the problem is now academic, and we know that this intermixing is actually destroying UHF, as such, in your black and white field, aren't we actually kidding ourselves by maintaining a further hope that this is going to survive? I realize if the entire TV world turns to be color TV—and it might well be one day—and if UHF can't be saved until such time as the manufacturers can be encouraged to manufacture all-channel sets through this excise suggestion that you have made—I can see some hope there. I can see some real hope, but what is going to happen to UHF until that day comes, if we have the process of 152 UHF stations dwindling down to 92, I understand, and with the represenation made here that every day they are closing up shop, and the only ones that seem to have any prospect of surviving are those which are owned by the large networks.

Mr. HEFFERNAN. I would say this. I do think we are not kidding ourselves to say there is hope if the twin action suggested by us can be brought about. Deintermixture would have the effect of a holding operation. It would give a beachhead of substantial areas where UHF could operate successfully, and from that beachhead it could grow and expand. Excise tax relief, even more important in our view to the development and growth of UHF, would offer what the UHF people are looking for, light at the end of the tunnel. They do not need, they say, immediate profitability today. They need to be able to see the long-term solution, and the long-term solution would be offered by excise tax relief because then they would know that every day they keep slugging away at it, their circulation is gradually growing and the circulation gap between them and their V competitors is gradually diminishing, and the solution is there and it is only a matter of working at it in time. The problem today is they do not see a solution, whereas excise tax relief would give a solution.

Senator PASTORE. Would you want to comment on this: That unless the Treasury Department sees this suggestion in a favorable light—this eliminating excise taxes on all-channel color sets—that this whole thing might be lost?

Mr. HEFFERNAN. I would think that is fair to say, though I do not want to get in the midst of a constitutional situation. Obviously, Congress has power to pass such tax action as they want to take without Treasury approval.

Senator PASTORE. I am not asking you to pass any law now. [Laughter.]

Mr. HEFFERNAN. As a practical matter you are right, Mr. Chairman.

Senator PASTORE. Those of us on this committee have very strong feelings along that line, but when you speak to a man who has the responsibility of deciding where and how a tax should be levied and he is so far removed from this very pressing problem that we have, even on a very personal basis, through witnesses who come here and tell us very emphatically that unless some relief is given, "I have got to close down because I am losing money every month"—that leads me to the conclusion that we have got to make a very strong representation.

Mr. HEFFERNAN. That is exactly right.

Senator PASTORE. The only strong recommendation we can make must be predicated upon the principles expressed here by people of responsibility such as yourself.

If I ask you a direct question it is only to get a direct answer on the record, because I am afraid that unless we can do that this will be lost. Otherwise, it will be considered merely as a gimmick. I realize that the Treasury Department does not want to make indiscriminate exceptions on these rules, because every time you do that, you run yourself into trouble. The minute you eliminate an excise tax, let's say on an all-channel color TV set, you have the jeweler in my State who says, "Well, if you remove the excise tax on jewelry, I can sell more jewelry;" and you have the theater owner who says, "If you remove the admission tax at the theater maybe we can survive in showing moving pictures, because we are in competition with TV."

So you see, when you get down to making exceptions you have to have a pretty strong case. I like this argument that has been made here, that this exception is not being asked by the manufacturer. He is not asking for this relief. He is only saying this: "Look, if you expect me to put the added cost in the development of an all-channel set, the only encouragement that you can give me to do that—because after all, I am dealing with stockholders' money—you have got to give me some relief on this excise tax. Otherwise, I just cannot undertake it economically because I do not think it is the responsibility of the manufacturer to save this industry." I think he is willing to, and wants to, play his part, but he wants a little encouragement from Government, too.

Mr. HEFFERNAN. That is a most realistic observation, and a most encouraging one.

Senator PASTORE. You are saying categorically that unless we find some solution in connection with the development of color TV so that we develop all-channel sets—which the manufacturers cannot do economically unless we equalize this added cost by elimination of the excise tax on all-channel sets—it is your considered opinion that we might well see the demise of UHF?

Mr. HEFFERNAN. That is right, sir. Of course, we hope that will not happen. It could very well.

Senator PASTORE. We all hope and pray that that will not happen. That seems to be the likely prospect as we sit here this morning.

Mr. HEFFERNAN. I think it is fair to say that, and therefore, may I make one specific suggestion in respect to that? That possibly when we conclude this phase, which is the allocation phase, that your committee might want to come out with an interim report which the Treasury would have as the expression of the views of this committee, that would enable them to consider the thing definitively.

Senator PASTORE. Well, I am not letting out any secrets. We have already directed a communication to the Treasury Department. The chairman of this committee has graciously and very thoughtfully, I think, made it his responsibility and his business to have a talk with Mr. Humphrey about the matter. We are now talking to the various Members of Congress who have the responsibility of deciding whether this should or should not be done, but I think our position would be fortified if we had these very responsible people like yourself. and like the representatives of CBS and ABC, come here and say: "Look, this is not a frivolous suggestion, and unless you do this the likelihood of saving UHF on the TV scene will wane, and unless this is done in the public interest, we may end up with 12 marbles—instead of these 82 marbles that you are talking about and which are needed to play the game." Once UHF disappears, I do not think you are going to revive it again.

Mr. HEFFERNAN. That is right, sir.

Senator PASTORE. It is disappearing so fast it isn't even funny; from 152 stations I think they have got it down to 90 or 95 or so. That is not very encouraging. It it continues at that rate, you are going to find the day when even the manufacturer of the set is going to say, "Look, we cannot get into the business of doing this, because we are not going to spend money on research and technical development on something that we can sell only at a ratio of one to a hundred of other sets." They are going to concentrate where the profits are. I don't blame them.

Mr. HEFFERNAN. That is exactly right, sir. The effect is cumulative once you start to roll down hill. I am very encouraged and appreciate the efforts which your committee has taken already along this line.

Senator PASTORE. We are not sitting on this thing. We are very much disturbed, but of course, whether or not we can sell it, or convince somebody else, is another problem. What problems will be posed for that committee, and for those people who have that responsibility, we do not know—because the minute they begin to make an exception, of course, then that snowball starts rolling, too.

Mr. HEFFERNAN. Yes, sir. May I say, in behalf of the point, that has in the past been the traditional approach of Congress and the Treasury not to place an excise tax on a new industry until it got started. VHF television was not taxed for 4 or 5 years during the period that it got on its feet, and it was not until the Korean war came along in 1950 that the tax was put on black and white TV. It got on its feet. It got strength. Now if color is given a chance to get on its feet and get strength, and the Treasury can come back someday, 5 years from now, and put the tax on when the thing is on its feet and when UHF is on its feet. That will be a different situation. It is not an irrevocable step. Congress sits every year.

Senator PASTORE. I am very grateful to you for those points.

Mr. HEFFERNAN. Just one last point on that: I appreciate, also, the fact that your committee is taking an interest in dealing with the Treasury, and I would hope that in addition to Treasury, other elements of the executive department would interest themselves, because they do make recommendations to Congress in respect to tax relief, because these considerations, as I have pointed out, are public considerations. It is the public which stands to lose if UHF goes down.

Senator PASTORE. Along that line, let me say this: There would be no better agency of the executive department than the Federal Communications Commission. Now whether or not they have done it, I do not know, but if they haven't done it it strikes me that they, together with the members of the committee, ought to join in this action and make a strong recommendation.

Mr. HEFFERNAN. They should.

Mr. COX. They have said they favored it.

Senator PASTORE. They have said they favored it, but whether or not they have made a strong representation is a horse of another color. I do not know if there is anybody from the Commission here, but I do say this——

Mr. COX. Mr. L'Heureux is here.

Senator PASTORE. Mr. L'Heureux, I say it for your benefit. It might be well for you to take this matter up with the FCC and tell them what our committee has done, and tell them of these representations made here, and it might be well and advisable for them, if they so feel, to direct a communication to the Treasury Department to explain to them the representations made here and that they ought to undertake, possibly, the suggestion of writing directly to the Treasury Department and say that they ought to consider this exception at this time, for the reasons already advanced.

Mr. L'HEUREUX. Mr. Chairman, I do not know just what has been done in the way of putting extra pressures upon the Treasury, but I shall carry your urgent message to the Chairman today.

Senator PASTORE. Well, that is right, and I do not like the word "pressure." No one is talking about pressure here but a strong recommendation that amounts to that probably.

Mr. HEFFERNAN. Such excise tax relief would of course have the incidental effect of helping some broadcasters—those in UHF. But as it does, as it helps them become established and profitable operators, it provides an offset to the revenue loss in excise tax relief through the revenue gain in corporate income-tax collections.

We therefore hope that the committee will continue its constructive efforts to obtain a repeal of the excise tax on the limited basis now proposed, and that it will bring to the attention of the Ways and Means and Finance Committees of the Congress, as well as the executive branch of the Government, the considerations of national policy which require support of such legislation.

DEINTERMIXTURE

At this point I do not want to burden the committee with semantics but I think it is important that we define what we mean by deintermixture. In this statement we use deintermixture in the sense in which it is now generally used in the industry. In that context, we do not suggest that any existing service be eliminated.

Mr. COX. Would it be fair to say, however, Mr. Heffernan, that channels granted but not yet on the air could be deleted without reducing existing service in the sense that you are using it here?

Mr. HEFFERNAN. That is right. They are not existing service. They are granted but not existing service. By existing, we mean on the air.

Mr. COX. So that you would be in favor of deintermixture to the fullest extent possible without actually depriving someone now receiving a signal of that type.

Mr. HEFFERNAN. That is substantially right. We favor it on a broad basis. There might be some local consideration that the Commission knows about which we don't know about, where in some situations they might not do it. We will leave that to the Commission because they are acquainted with local conditions. We do favor it on a broad basis. I think we are speaking of the same thing.

One of the important affirmative steps the Commission can take now to preserve and support UHF is to deintermix on a sufficiently broad basis to create a number of predominantly UHF markets. Without this, the public may not purchase all-channel black and white receivers in sufficient number to provide a market for the continuance of manufacture of such receivers. But with deintermixture on the basis we suggest, UHF will grow in a nucleus of areas from which it can spread to others.

Deintermixture on the basis we have suggested would give immediate support for UHF, and excise tax relief as now proposed would complement this immediate support by providing encouragement now and assurance of progressive improvement in the long range. The two actions taken together would constitute an ideal combination for the maintenance of UHF as an indispensable part of the national TV service.

In suggesting deintermixture to the Commission in our comments filed in the Commission's current allocation proceeding, we proposed a number of specific criteria on the basis of which deintermixture could be applied advantageously and without disrupting or degrading existing service to the public. These criteria are:

The areas to which attention should first be directed for deintermixture are those which have considerable UHF circulation now in existence.

Mr. Cox. Would those be substantially areas like Madison, Evansville, Fresno, Miami, Springfield, Corpus Christi, and places like that where there are either no VHF stations on the air, or there is only one V and the U's in the area have been able to achieve a fairly high degree of conversion?

Mr. Heffernan. There is another category as well, the category of areas to which two V's are assigned, but only one is now on the air, such as Albany-Troy-Schenectady. Those are candidates for deintermixture as well. They are a category of candidates, but in those, in accordance with our definition, the one V would remain, but only one, because if it becomes two V's——

Mr. Cox. The problem becomes too difficult?

Mr. Heffernan. Then the problem becomes too difficult. There are the two categories, and by the way, on the white area point which was discussed yesterday, to the extent there is validity to that, and there is some validity to it, currently, by virtue of the present superiority in coverage of VHF over UHF, the existence of this second category diminishes that problem of white area, because in all those areas, there is one V existing, so that the white area problem, to the extent it is a problem, does not exist because there is a V there already and it would remain. Therefore, to the extent that white area point has validity it applies only to the other category of candidates for deintermixture which are presently all U and are proposed to remain all U.

Mr. Cox. In those areas, however, the loss of additional coverage which might be sought under the Commission's first priority in the sixth report would be a price that would be paid, on the other hand, in order to preserve UHF so that its other priorities of local community service and of multiple service could be more easily attained?

Mr. Heffernan. I think that states it fairly, but I think you would have these further compensating values, that it states it as it is currently. If UHF progressively improves, as it is believed and hoped that it will, then you progressively diminish the discrepancy in coverage; and secondly, there are other devices by which UHF stations can reach out to cover areas, if they are significant population areas, that are not covered from the main transmitter, such as boosters, satellites—

proposals which are now before the Commission for adoption in part, some of which have already been adopted. To take the upper Connecticut Valley for example, we have an affiliate in Springfield, a UHF affiliate. He covers Holyoke, but going on up the Connecticut Valley by use of a booster or a satellite, he might reach into Amherst, he might reach into Greenfield, he might reach into Brattleboro, Vt., continuing up the Connecticut Valley. Where you have cities of that sort that wouldn't be covered from the main transmitter, devices exist, at relatively low cost in relation to the additional coverage attained, by which the UHF could diminish that difference.

Mr. Cox. So that even the present failure to extend the service as fully as might be possible by granting an additional V is only a temporary failure to expand service?

Mr. Heffernan. It is believed and hoped to be, but then I am referring to these other devices which are currently available to pick up significant population areas, such as boosters, satellites. I say currently available—currently proposed by the Commission in respect to boosters, presently available in respect to satellites.

VHF channels which would be displaced as a result of deintermixture would be used, whenever practical, to increase competition and service to the public in major VHF markets.

I think the significance of that is clear. It means you get a double dividend from deintermixture; namely, not only do you improve the chances of UHF to survive and grow in the areas deintermixed, but the V channel, which is displaced by deintermixture is not thrown away. It is used in another area to increase V competition in that area and make that a three-V market in many instances.

Mr. Cox. If you take a V from Hatfield, you can place it in Louisville and give that a third service, or you can take a V from Madison and put it someplace else where it will be useful in expanding service.

Mr. Heffernan. Without regard to those specific instances, in general, that can be done. I think in the case of Louisville it can be accomplished without any degradation of service, not in the particular way in which you spoke. I think that is important, because Louisville is one of the largest markets in the United States that has only 2 V's assigned, and it would be possible, we believe, to assign three V's to Louisville without degradation of service.

In markets to which at least three commercial VHF channels are now allocated, no deintermixture would be undertaken.

In any market which becomes a predominantly UHF market as a result of deintermixture or which now has considerable UHF circulation, no new commercial VHF allocations would be made.

In connection with deintermixture on this basis, situations will arise where a UHF channel will be substituted for a VHF channel which has been granted to a CP holder who is not yet in operation or who commenced operation since the institution of the Commission's current allocation proceeding. In these circumstances it would be desirable if the holder of such a CP could be granted a CP for the substituted UHF channel without further proceedings. This would enable the additional service to the area to be instituted without delay. If the Commission believes that it needs additional authority to follow such a course, we recommend that the Congress enact legislation specifically providing for such authority under these circumstances.

MULTIPLE OWNERS AND OTHERS SHOULD BE ENCOURAGED TO ACQUIRE UHF STATIONS IN INTERMIXED MARKETS

NBC's views on the importance, from the standpoint of the public's interest, of permitting multiple owners of television stations to acquire UHF stations are well known. Even before UHF channels were made available for commercial use, NBC asked the Commission to amend its rules to permit owners with know-how, experience, and resources to undertake part of the task of furthering the commercial development of UHF.

More than a year ago the Commission did so amend its rules and shortly thereafter NBC contracted to purchase UHF stations in two intermixed markets—Buffalo and New Britain. The station in Buffalo had gone off the air and was literally raised from the dead by our action. Three VHF stations are assigned to Buffalo, so the going will not be easy. However, it is significant to note that following the Commission's approval of our acquisition of the Buffalo UHF station, an application for another UHF station in Buffalo was filed and has been approved—indicating the confidence in UHF's future in this market as a result of our activties in support of UHF.

Mr. Cox. Would that be largely because it is felt you would be able to achieve a degree of conversion which would then be available to additional UHF operators?

Mr. Heffernan. I think that is a fair statement; but you also notice that Mr. English, testifying here before, I believe, another committee in Washington last week, stated that our going in Buffalo would also be helpful to his UHF operation in Erie, because Erie, as you know, is to the west of Buffalo, so that as UHF circulation grows westward from Buffalo, it will tend to come to an area between the two cities, which will be helpful to him.

Mr. Cox. That is, people will convert to get a choice of 2 signals where they might not for 1?

Mr. Heffernan. That is right; people midway between; plus the fact that the word will get around from Buffalo, down to Erie, which is relatively close by.

We took over the UHF station in Buffalo on December 30 last, and moved at once into a vigorous campaign to lift the circulation of the station and thus cut down the disparity in circulation between it and its VHF competitors. We are building new studios, going to the full power of a megawatt permitted under present rules, installing color equipment for both network programs and local color originations, expanding hours of programing, and bringing these facts to the attention of the people of Buffalo with an extensive promotional campaign.

As I mentioned before, we have also contracted to purchase a UHF station in New Britain, and our application on this matter, which has been designated for hearing, is before the Commission. When our New Britain application was filed, two holders of CP's for UHF stations in the Connecticut Valley filed statements with the Commission in support of our application, pointing out how our operation there would help all UHF. We expect that a hearing date on our application will soon be set and believe that the hearing can be expeditiously concluded.

As soon as we are in a position to operate in New Britain, we intend to conduct the same type of aggressive campaign to help UHF that is already underway in Buffalo, and we believe that the results will not only be beneficial to UHF in the Connecticut area but will be an encouragement to UHF throughout the country.

In this connection I would like to point out that there are many other broadcasters who currently own and operate multiple VHF stations. A few of these are helping UHF by the operation of at least one UHF station in intermixed markets, but the great majority of them do not have any UHF stations. A strong declaration of national policy in support of UHF, followed by specific steps by the Commission to implement that policy, should in itself encourage these broadcasters to undertake UHF operation, and thus lend their know-how and resources to assist in UHF development. Some of these broadcasters are also prominent publishers, who could provide the additional assistance of widespread promotiton of their entry into UHF.

In our view, those who have experience, resources, and basic interests in television and electronics should be encouraged to help the cause of UHF by undertaking the operation of at least one UHF station.

Mr. Cox. Is it your major point in this connection that these other multiple owners, or people in strong positions, should be encouraged to do this, or that further relaxation of the Commission's multiple ownership rules would be desirable?

Mr. Heffernan. The latter is not my point, sir.

Mr. Cox. In other words, you think the present rule allowing 5 V's and 2 U's is ample, and that some others should carry part of the burden that NBC and CBS have undertaken by attempting to promote UHF through operation of their stations in intermixed markets?

Mr. Heffernan. That is generally correct. I do not want to limit the credit, however, to NBC and CBS.

Mr. Cox. Mr. Storer also?

Mr. Heffernan. Mr. Storer has undertaken one in Miami.

Mr. Cox. And one in Portland?

Mr. Heffernan. Which was not a prefreeze market, and WDSU, which is not, however, a multiple owner, but it is to its credit that although it is not, it has undertaken a U in Baton Rouge, and there are a few others who are doing so, and to their credit. But my point is that there are a number of VHF operators, multiple owners, who have profitable V operations, who could well afford, who have the resources, who have the know-how—they are experienced broadcasters, they know how to operate a broadcast station so they are not going to slip for lack of know-how; if they got in and publicized their efforts, the very fact that they are going in—in this industry, the word gets around very rapidly—the fact they are going in is an encouragement to UHF as a whole.

Mr. Cox. I take it that in that connection you would feel that the effort should be made to encourage multiple owners, or other people in a strong position, to go into intermixed markets with U's rather than to simply purchase a station in an area which is already all UHF, where conversion is already achieved; that is, their special contribution can be in extending this service in areas where it either now doesn't exist or where it is having difficulty?

Mr. HEFFERNAN. That is correct, Mr. Cox. They should do a pioneering job, is my point. There is really no great difficulty in making a success of UHF in a market that doesn't have V competition, because UHF technically does a good job in those markets and they are doing all right. The problem is to make a go of it where the circulation problem exists, but my point is they can afford to ride it through.

A point further on encouragement is that if we got the excise-tax relief and the deintermixture action, those points themselves would be the encouragement to people to jump in and, I think you might see, if those two actions came about, I think you might see a scramble for UHF channels that would rival the Oklahoma land scramble. You might see it, because television stations are something that people very much want to get into, where they are successful, and they don't have to be presently successful. It is the prospect of success that will bring them in. While it is true that a number of stations have gone off the air, every fellow who is in a position to hold on to his grant has done so, because he realizes the potential for the future is there, if these actions come about.

In that connection, Mr. Cox, of course, time is of the essence, because our point on deintermixture is that we need a beachhead from which we can grow and expand, and we need excise-tax action. Unless these actions occur soon, it may be too late.

BOOSTERS AND INCREASED POWER FOR UHF

The Commission's proposals with respect to boosters and maximum power of 5 megawatts for UHF would permit UHF stations, where they desire to do so, to improve their coverage position in relation to their VHF competitors. These are desirable objectives, and ones for which the Commission deserves credit.

If the Commission authorizes the operation of UHF stations with maximum power of 5 megawatts, it would, of course, accelerate the time when commercial models of equipment for such operation would be available. The Commission has rightly proposed that its rules should not stand in the way of an improvement in UHF station coverage.

As far as boosters and translators are concerned, such technical auxiliaries can, under certain circumstances, aid UHF stations in providing more effective coverage by filling in shadow areas which fall within their service areas, thus helping on the so-called white area point.

Although the application of these devices requires analysis of the specific conditions in the particular area which may be involved, we believe that the authorization of booster and translator stations, under suitable circumstances, offers an additional technical means of improving the effectiveness of UHF operations.

Mr. Cox. I take it you feel, Mr. Heffernan, that this proposed increase to 5 megawatts of power would substantially improve the performance of UHF?

Mr. HEFFERNAN. It would.

Mr. Cox. That is, both in terms of some extension of its coverage area, and of improvement of the quality of service within the area?

Mr. HEFFERNAN. That is right, both aspects are important.

I have now covered the affirmative steps we have recommended to the Commission and which we present to this committee as measures in aid of UHF and the development of a national television system based on a multiplicity of facilities. I would like now to comment briefly on other proposals which we believe have questionable or limited value.

PROPOSALS TO OBTAIN ADDITIONAL VHF CHANNELS FOR THE BROADCAST SERVICE

This proposal looks to the possibility of obtaining the allocation of additional VHF channels from other users of spectrum space, particularly the military. While we agree that this and related proposals should be examined, we feel that this particular suggestion has little promise, for several reasons:

In the first place, even if several additional VHF channels could be obtained, these plus the existing 12 VHF channels would fall short of the number needed. In adopting the Sixth Report it was the Commission's aim to provide at least 3 stations in the first 140 markets. In the crowded northeast section of the United States this could not be fully accomplished, however, even with 82 channels. It is obvious from this how inadequate a plan would be based on 12 or 15 channels.

While a few more VHF channels would provide some improvement in a limited number of markets, it seems unlikely that such additional channels could be made available soon enough to provide any immediate, or even near-term relief.

If additional channels were made available, they would pose a new conversion problem with respect to the sets already in the hands of the public, which now number over 37 million and which would have increased in number by the time any such additional channels were available for operation.

And finally, if a few more VHF channels were made available, the preoccupation of the industry with how and where to use these would inevitably prejudice the further development of the 70 UHF channels during the entire time that the allocation and disposition of these few VHF channels were in contest.

Mr. Cox. So that you would exchange for a relatively inadequate group of additional V channels the much more numerous UHF channels, if only these other problems can be dealt with?

Mr. Heffernan. We are fearful that would be the inevitable effect, and I think in comparing this numbers game we should look to the fact that in radio, in AM radio, we have 106 channels, and constant demand for more. In FM, 100. The concept of 12 or 15 is one that the Commission knew from the beginning wouldn't work, and won't work in terms of satisfying the need.

PROPOSALS FOR VHF "DROP-INS" BY REDUCTION IN MINIMUM MILEAGE SEPARATIONS AND USE OF VHF DIRECTIONAL ANTENNAS

Another series of proposals before the Commission looks toward making room for additional assignments of the present 12 VHF channels by reducing the minimum separation between stations. Various methods have been suggested to reduce the interference which would result, including the use of directional antennas, cross-polarization, and reduced antenna heights and power.

In our comments to the Commission in its allocation proceeding, we urged that before any action along these lines is taken, the subject should be thoroughly studied and experimental data assembled on actual performance in various types of situations.

We come now to "drop-ins," and here again we have a definition. We define a "drop-in" as meaning a station which does not conform to the present rules with respect to station separation, which we think is the commonly used meaning of that word, though sometimes "drop-in" is used in the sense of putting in one that does conform, while one which does not conform is called a "slug-in."

The danger exists that the use of VHF "drop-ins," with reduced separations between stations, will result in a degradation of service or a deprivation of service, particularly to millions of rural and small-town viewers in populated areas between metropolitan centers.

Some who advocate drop-ins frankly concede this, but seek to minimize it by reference to service to the farm and smalltown populace as—I am quoting their comments—"fringe" service. In our view this is one of the major policy questions for resolution by the Commission and cannot be dismissed, as do these advocates of drop-ins, by characterization of rural service as fringe.

A principal defect of the several drop-in proposals is common to all of them. They would so prejudice the development of UHF, by transferring the industry drive to the discovery of how to squeeze new stations into the 12 VHF channels, that the 70 UHF channels could be lost to television broadcasting. Thus the drop-in approach could have the effect of eliminating UHF without providing a satisfactory substitute, since the VHF-only system which would be left after the loss of UHF would be both inadequate in number of channels and degraded as to quality of service to rural and small-community viewers.

Mr. Cox. Isn't it also true that not only would effort to concentrate on this occupy much of the attention of the industry, but that in tending to increase the concentration of VHF stations, particularly in zone I, it would still further complicate the chances of survival of even existing UHF stations in those areas and almost completely rule out the development of additional U outlets?

Mr. Heffernan. I think that point is very well taken, extremely well taken. It could very well have the effect of killing UHF and thereby eliminating the potential for community service which UHF provides today—actually provides in some operating stations, and the great potential is there for development, once we lick this circulation problem, to which excise tax relief is the key.

Certain comments filed in connection with the Commission's allocation proceeding and in part repeated before this committee indicate considerably more optimism about decreasing mileage separations by the use of drop-ins than we believe is warranted. For example, the comments of one company state in bold heading that VHF mileage separations can be reduced "slightly." But the text of its comments and reply comments make clear that it favors in some instances a reduction of cochannel separations of more than 45 percent.

On this subject we have recommended to the Commission that proposals involving a change of standards to permit VHF drop-ins be analyzed with great care, so that action designed to obtain a greater utilization of the VHF channels will not have the byproduct effect of producing an overall degradation of service.

We have also urged that any modification in the present standards should be accomplished only by the adoption of a new plan. A case by case approach, in which the present standards would be relaxed to solve individual problems, will inevitably result in a progressive deterioration of service to the public. We have, therefore, suggested that the Commission deal with a revision of the present allocation plan in terms of a modified overall plan based upon the following principles:

A modified plan should be predicated upon channels actually available for commercial television use at the time of the plan's adoption.

A modified plan should allow for substantial expansion of television service over a considerable number of years.

No modified plan should be adopted which results in degrading or destroying rural and small community service.

The paramount consideration in the adoption of any plan should be the interest of the public.

I want to say, in dealing with this subject of drop-ins, that we are not opposed, and we are sympathetic, to the desire of expanding the number of markets to which three VHF channels can be assigned, but as I indicated earlier, that can be done in substantial part as a byproduct of deintermixture, by virtue of the V channels displaced by deintermixture which move to larger markets.

Further, I think it important to recognize that the need for three VHF outlets in many markets, which has been referred to, is in part an allocation problem and in part a problem of getting cases decided before the Commission. For example, last fall, a petition was filed, styled: "Petition To Revise Television Allocations Standards and the Table of Assignments." That petition was based on an exhibit—there was an exhibit attached to that petition, referring to clearing in various markets.

The first four of those markets were Boston, St. Louis, Indianapolis, and Buffalo. In all of those markets, three V's are assigned, though not now on the air. Now that, I submit, is not an allocation problem. But again I want to say I am sympathetic with the need to increase, wherever practical, the number of three V's in major markets, provided that is not done to the prejudice of a long-range, sound allocation plan, including the importance of the maintenance of the concept of community stations.

CONCLUSION

In its allocation proceeding the Commission is faced with immediate problems. But an allocation proceeding looks to the future as well. The sixth report sought to do this by the allocation of 70 channels in UHF.

UHF has now had a commercial trial of a little more than 3 years. In that time some UHF stations have proved a success; some have not. The Commission has recognized that in the latter instances economics may have been a factor. It is naturally concerned whether its current allocation plan may also have been a factor, and it acted wisely, we believe, in asking comments from all interested persons in respect of that plan.

The comments which have now been filed with the Commission, taken as a whole, reflect a broad awareness of the important public reasons for preserving the 70 UHF channels, as well as the 12 VHF. We believe those who have spoken out for this position have taken the long-range and statesmanlike view.

An example is the letter of President George Meany to the Chairman of the Commission, filed as the comments of the AFL–CIO. He said in part:

> * * * At stake here is whether the American people are to eventually have a nationwide system of 2,000 TV stations, or to be cut down to a system of scarcity of stations. * * *
>
> * * * the Commission should preserve and encourage as full use as possible of the 82 channels. * * * Anything else would be a disservice to the American public.

If he, President Meany, and the many others who have taken this position are right, it follows a course that an allocation plan based on 12 or 15 channels, with or without lowered standards, is of doubtful utility as a long-range policy of allocations.

The national policy with respect to television broadcasting calls for a nationwide competitive system based on the maximum practical number of facilities. The full and effective use of the UHF channels offers the best prospect for realizing this goal.

The decisions to be made now with respect to the future of UHF television are not decisions for the next 5 or even 10 years. The effects of these decisions will be felt throughout the foreseeable future.

If our generation fails to lay a broad foundation for UHF service in the 70 channels reserved for that purpose, then other communication services will move in and make use of that part of the spectrum. If this happens, this spectrum space will forever be lost to broadcasting and no other band of frequencies anywhere near as well suited for television is available. The issue, simply stated, is shall the 70 UHF channels continue to be available to broadcasting or shall they be lost to other radio services?

We believe the Commission showed great foresight in earmarking this frequency band for the expansion of television. It is needed for that purpose, and the Government and the broadcasting industry can and must find a way of preserving UHF as a broadcasting service in the interest of all the people. This will not be easy, but when we look back on the miracles already accomplished in this country in the field of radio and television, we are encouraged to believe that this, too, can be done.

We do not suggest that Congress and the Commission alone have the power to establish UHF. The future success of television broadcasting in the UHF requires active support by the Congress, the executive branch of the Government, the Commission, the broadcaster, and the public.

However, there are actions which can be initiated at once by the Congress and the Commission. The Congress can make a vital contribution by promptly declaring that the national policy calls for preserving and strengthening the UHF service, and by enactment of the limited excise tax relief to which we have referred.

These actions would be of immediate and incalculable value to the cause of UHF.

For its part, the Commission can act at once to preserve and strengthen UHF by deintermixture and the other steps we have suggested, and it can at the same time proceed with its detailed analysis for other action in the light of its expert knowledge of allocation principles.

Thank you very much.

Mr. Cox. Are you familiar in general, Mr. Heffernan, with the testimony of George Storer, before the committee, with regard to his plan, which I think was substantially encompassed in his comments to this allocation proceeding?

Mr. HEFFERNAN. I have read Mr. Storer's plan, or have been told of it.

Mr. Cox. The only point I was interested in was whether you thought, not in all details, but whether a program of that order of magnitude would hold real promise, if it could be effectuated, of providing the sort of stimulus and guaranteed continued existence for UHF and incentive to the development of better equipment, which would be necessary to really keep the thing moving along?

Mr. HEFFERNAN. I will come to your question. I want to say generally, our position is that the Commission should deintermix on a broad basis, by which we mean to give a substantial basis. I think there has been a slight misinterpretation of Mr. Storer's proposal. There was a reference here to 25 markets. Actually 24 markets are affected in the Storer plan. However, 14—6 to all UHF, 8 to 1 VHF—are the so-called strictly deintermixed markets, and the other 10 are markets which become—9 become 3-V's and one 4-V's. So that 24 markets are affected, but actually 14 markets under the Storer plan are direct beneficiaries of deintermixture in the strict sense.

Mr. Cox. It is in those markets that he says there are 20 million people and 4 million sets, I believe.

Mr. HEFFERNAN. I am not sure he makes that statement, but I would say this: That taking the successful UHF markets of today and adding 14 or more markets—it could well be that more markets than 14 can be found for deintermixture—in my opinion, that would be a substantial beachhead from which UHF could grow and expand. Because the problem here, the beachhead problem, is this: That unless there is a sufficient public demand for all-channel sets, manufacturers won't continue to make all-channel sets, if the public is not broadly asking for them. There is no point in making them and putting them in the warehouse in inventory. If they are not sold and put into the hands of the public, they don't do any good. But my answer to the question of "Would 14 plus existing successful markets be a substantial beachhead?"—I think it would, and I would hope, however, that the 14 could be increased somewhat because our own view is that the Storer plan—that alternatives to the Storer plan are available which are better.

Mr. Cox. Have you made any study of the number of other markets in which this might be done?

Mr. HEFFERNAN. We do not have a precise number, no, because we frankly have felt we should stay away from that for two reasons: We are personally interested, for example, in the Connecticut Valley area, and it seems a little unseemly for us to come here speaking, as we want to speak, of the considerations of public interest that generally relate to this problem, and at the same time plead our cause in an area where we have a personal interest. If we plead for deintermixture in the Connecticut Valley, that detracts from the general value of our testimony, because they say: "They have a personal interest. They have got an ax to grind, and that is why they want deintermixture." That is not the reason we suggest deintermixture. We suggest it as a general policy in the interest of UHF and its growth and development. But I would say this, Mr. Cox, I don't really think the basic question on deintermixture that has faced the Commission has been "where"—it has rather been "whether"—whether to deintermix. Hamlet's question, and the difficult one, "To be or not to be," was not how to take his life, but whether to take his life.

Mr. Cox. Do you know—this, of course, is asking perhaps the question of the wrong person, but do you know what the arguments are advanced against deintermixture on the kind of basis that you are proposing, not on an overall basis, but on a basis sufficient to provide a substantial UHF or safe UHF area?

Mr. Heffernan. I thought that Mr. Lodge yesterday referred to the point that a fellow who has presented a case for a single channel that is assigned, let's say, in a market and has pursued an application before the Commission for a number of years and spent a lot of money on engineering and lawyer fees, has built up a certain equity in his own favor, and I think it is fair to recognize that he has. It is a policy question to weigh that, plus other local considerations which may exist, which he didn't mention, but I am sure would recognize, that other local conditions may exist in favor of a grant as against the considerations, of which I think you are aware, which favor deintermixture. That is a balancing. That is a policy decision to be made by Government representatives themselves, by the Commissioners. It is a policy decision as to whether the equities of the one outweigh the equities of the other.

Mr. Cox. This personal situation of the individual V applicants, plus the claim of added service on the fringes of an all-U area, would be, so far as you know, about the only factors that enter into the calculation in opposition to deintermixture?

Mr. Heffernan. There is the situation that would apply to us in Buffalo, where three V's are assigned to the market. I don't think there is any logic—or put it this way, I don't think a persuasive case can be made to deintermix a market where three V's are assigned in the allocation table, because there is no serious problem of getting equally competitive service in that market.

That applies to Buffalo, perhaps—it applies to Buffalo and elsewhere. We would not urge, for example, that Buffalo be deintermixed, even though on the first of our criteria there is substantial UHF circulation in Buffalo, roughly 25 percent. It is a long way to go, but it is substantial in that sense. There is that argument on the other side, appropriateness.

Mr. Cox. Could you tell us, generally, how many UHF affiliates NBC has now?

Mr. Heffernan. Thirty-nine.

Mr. Cox. How many of those are included in your first hundred markets?

Mr. Heffernan. It is 15, possibly 17, the other 2 being on a somewhat occasional basis.

Mr. Cox. I realize, of course, your problem there is one of being competitive with the other networks; but I think there has been considerable testimony, of course, that one of the problems faced by UHF stations in intermixed markets is their difficulty in getting a full affiliation, even where they may be the third station in the area, because of an attitude which they may attribute to the network, but which perhaps may be more properly attributable to the advertiser in turn, but is there any possibility of revision in affiliation practices which might contribute to the well-being of UHF?

Mr. HEFFERNAN. I want to say on behalf of NBC and our policy on affiliation, I think we have—and I don't say this critically of others, but I do think we are entitled to credit for being willing to accept, in view of present disparity in coverage between UHF and VHF, we have been willing to accept a certain handicap, measured handicap, to our network in UHF affiliations that I think is to our credit.

We have, for example, affiliated the UHF station in Norfolk. It was on the air down there. It was available to others, and when the VHF station, on which both NBC and CBS had been putting their programs—we on a first basis, and CBS on a secondary basis—when it went off to CBS on a first basis, instead of our taking second place on the pole as they had done, we went to the UHF station. We went in with a promotional campaign to help it, and we have been with it ever since, and we have helped it build circulation; and we have on 2 separate occasions torn up our contract with it, and given it a new, 2-year contract from that date, which we were not obligated to do. We have done that in spite of the fact that another V is assigned to the market and may come on at any time. We have shown, we have been willing to stay with that U and have committed ourselves by contract to do so for the maximum period permitted.

We also, I think, deserve credit for the fact that we have in our basic lineup situation six UHF stations. No other network has any basic UHF affiliates. We have six.

Mr. COX. Does your contract in Norfolk have a provision that permits you to cancel it if and when the V comes on the air?

Mr. HEFFERNAN. It does not.

Mr. COX. There can be no question, can there, that the possession of a strong affiliation is a good part of the solution of the circulation problem of a UHF station?

Mr. HEFFERNAN. It is helpful, but I would say this: That it is not the full—and I wish I could say that it were—it is not the full solution.

Mr. COX. You have your problems in Buffalo?

Mr. HEFFERNAN. More than that. After 3 years—2½ years of operation in Norfolk, we are substantially handicapped in circulation there, a handicap, as I say, that NBC has been willing to accept to help UHF. But the circulation in Norfolk after 2½ years of NBC programing, things like the world series, is substantially below that of its VHF competitor. I don't want to sit here and prejudice that fellow's competitive position by putting something on the record that his competitor will use against him on Madison Avenue. This is very delicate, but it is realistic that he is at a substantial circulation competitive disadvantage today after 2½ years of NBC network programs. So network programing is not the entire solution.

He is, as I indicated, 1 of those 6 who are a basic station, so he has had all the network programs that he wanted to take; and he has wanted to take most of them—nearly all of them, so that he has had all the advantages of network programing, but that has not in and of itself overcome the circulation handicap. It helps. You are unquestionably right. I would not want you to get the view, however, that that alone is the solution, and I don't want to be too persistent about the point, but our position is that the key to this solution is the excise-tax relief on all-channel color sets, because then all operators, network affiliated and not network affiliated, will see light at the end of the tunnel. They will know that a solution does exist, and it is a matter of time. Their difficulty today is they do not see any clear solution. They will then see such a solution.

Mr. Cox. Norfolk is one of the areas in which a deintermixture proposal has been made, isn't it, since there is only one V on the air there?

Mr. Heffernan. It may well be included on the list.

Senator Schoeppel (presiding). I would like to ask you a question with reference to the excise tax. Time, you indicated in this statement, is a pretty important factor to take into consideration. We are presently in session now. Let's assume that in the wisdom or the judgment of the Congress—sometimes it doesn't go according to Hoyle—that we are unable to get some relief. Personally, I think it is a much needed relief. Say this thing should drag out for 2 or 3 more years. In your candid opinion, would that be a serious prejudicing of the situation?

Mr. Heffernan. Most serious, Senator. In fact, it would raise the question as to whether UHF could survive.

Senator Schoeppel. That was the point I was coming to.

Mr. Heffernan. Most serious. I would hope—while we are most hopeful of cooperation from Congress on the excise-tax point for the industry, for the benefit of the public we hope that the executive branch would understand the importance of this as well, because we are speaking here of something of incalculable value to the Nation, namely, a communications system under which the President of the United States, for example, in times of national emergency can go on the air and speak and be seen by all the people, and not just those who happen to have service within the range of the big city markets, but all the people, in all communities. It is most important. It is a national service, a national communications service, a national problem, and the amount of revenue involved under the proposal that is now made is relatively small, quite small.

Now, the executive branch has, as you know, Senator Schoeppel, interested itself in this Congress in making a recommendation for relief in one area in the excise tax. I agree with that. I think it was sound, but the executive department considered that, came to Congress, recommended it, Congress did it.

I agree with everything they did. To my mind—and of course we are in this industry—this is of equally vital importance to the Nation, this particular excise tax relief, to give the Nation the kind of communications service, vital service it needs and it deserves. The reason I keep bringing the point up from the standpoint of public consideration is that if we go to the Treasury, or to the Ways and Means or the Finance Committee, they say, "You fellows are broadcasters and every fellow is on our doorstep, wanting excise tax relief"—and they can understand our wanting it—"but you are here to promote your own personal interest, and while you talk in terms of public considerations, everybody does that." But this committee, I believe, based on its past actions and its actions at this time in writing to the Treasury, of which

Senator Pastore spoke to us, you do realize that these are public considerations and not private considerations.

You do realize that. You, therefore, are in a position to present to the executive branch, to the White House I would hope, these public considerations and enlist their sympathy and aid and help in this matter, because if you get the cooperation of Treasury, you are a long way down the road, as you know.

Senator POTTER. If you will recall it was 2 years ago when, I believe, Senator Johnson and myself, appeared before the Finance Committee to try to get the tax removed, in an effort to promote the all-channel tuner. At that time, the main objection, of course, was from the Treasury Department, the Bureau of Internal Revenue, that we would lose the funds involved. I think you are absolutely right. I think the administration would have to see it in the light, not just of the matter of revenue that might be lost, but an industry that is vital to our national defense. It is going to be greatly hampered unless this excise tax is removed so that we could have all-channel tuners on a nationwide basis.

Mr. HEFFERNAN. I am glad you brought that point out because I do think you, Senator Schoeppel, and the other members of the committee at that time deserve credit. You not only appeared before them, you adopted a resolution of the Senate Interstate and Foreign Committee. You appeared before them. We had a fortunate happening at that time. Senator Edwin Johnson was a member not only of this committee but of the Finance Committee, so he was able to point out to them the considerations of national policy, and the Finance Committee at that time did actually adopt a proposal which went part way down the road to give the relief.

That proposal was adopted and favored by the Finance Committee but it was lost in the adjournment rush, because we met, if you remember, in May and June, and it was in June before we got to this point, and it was lost in the rush.

This time—I am not sure you were here, Senator Potter, when I made the point about excise tax relief—partially to meet the Treasury's objections—and I have seen their letter to the Ways and Means Committee which was solely on the basis of diminishing the revenues—we are limiting the proposal for excise tax relief to all-channel color sets. Well, it happens that all-channel color sets are not being made in great volume today.

Senator POTTER. They are not losing revenue.

Mr. HEFFERNAN. They are not losing a great amount of revenue. Therefore, we have sidestepped the principal objection of the Treasury, whereas the public advantages of the proposal are still there, and the disadvantages are not there. We have the further argument that color, being a new industry, the Treasury and Congress have traditionally refrained from putting an excise tax on a new industry until it gets on its feet.

For example, black and white TV sets were not taxed, were not subject to an excise tax during the first 4 or 5 years of their growth. It was not until the Korean war came along that the tax was put on black and white sets; so that black and white got a chance to grow and develop as an industry and get on its feet before being subjected to tax.

Further, if Congress would now exempt all-channel color sets from the tax, it is not an irrevocable step. If color mushrooms and grows, as we all hope it will, and UHF is tied to the kite of that growth, Congress at some time, some future Congress, can reimpose the tax. This is not an irrevocable step. It is a step taken now in the interest of national policy so the President, in time of emergency and at other times, and other public officials can go on TV and speak to all the people; those served by the large city stations and those served in the smaller communities, and we can have both objectives, and I support the objective of CBS and of ABC to have three V's in more markets.

We are for that, but we think there is a means of having both objectives the Commission laid down. That is, both the community service and three V's in more markets.

Senator SCHOEPPEL. I am glad to hear you make this analysis, because from a practical standpoint the Congress, what the Congress and I am sure the departments have been confronted with, follows something along this line. They say, "Well, if you remove the excise tax, then there are other excise taxes in certain industries and they say we should have them removed." But particularly this situation, as I view it, is entirely different because here we are building something for the future.

We are trying to preserve a greater overall sphere of use or activity which, if we stifle it now, is going to sort of freeze it, so to speak, and we will inevitably lose a lot of it. Therefore, I was especially interested in your judgment as to the time limits of this action. I personally feel that it is something that I am hopeful that we can take care of in this session of the Congress.

Mr. COX. That is all I have, Senator.

Senator SCHOEPPEL. Senator Potter, do you have anything?

Senator POTTER. I would first like to apologize to Mr. Heffernan for not being here to hear your statement. I had planned on it, but I had to utilize your television facilities in my schedule for today.

Mr. HEFFERNAN. We appreciate your interest in coming, Senator. We have tried to present a proposal under which the objective that was discussed yesterday of increasing the number of markets where three VHF stations could be assigned is possible as byproduct of deintermixture, but at the same time preserve a system under which communities could be taken care of with UHF stations, so that both objectives and not just one could be attained. And we do think that is possible if we get the key to the solution, which is excise tax relief, which in turn is the key to the circulation problem, which is the problem of UHF.

Senator POTTER. Do you have the same doubts as Mr. Lodge, of CBS, as to the engineering potential of UHF; that is, it is an inferior type of television reception?

Mr. HEFFERNAN. Well, Dr. Engstrom testified before this committee. I did not have an opportunity to be present. He is the senior executive vice president and engineering official of RCA, and we stand on his testimony as to the technological differences. I think I correctly summarize them in saying that we must be realistic in recognizing that, as of today, VHF does give you superior area coverage to UHF. However, Dr. Engstrom pointed out that based on the whole history of technical development of the electronic industry, we can expect that difference will diminish as new improvements come in. The rate at which it diminishes may be slow. We don't promise miracles are coming out of the laboratory tomorrow. But in addition to that point, there is before the Commission now a proposal under which the UHF stations could extend their coverage by the use, for example, of boosters. Satellites have already been authorized, so that if there are additional areas of significant population that a UHF station wants to go out and reach for, he is not limited to doing so from his main transmitter. He can use a booster, or a satellite. As you know up in your area, Traverse City is operating as a satellite now, of Grand Rapids and very successfully, I hope.

Senator POTTER. We hope we can use it in Cheboygan.

Mr. HEFFERNAN. We are hopeful, too. We have interested ourselves in that area because we think northern Michigan should have TV service, and it should have the type of TV service to the extent it is practical to get it economically, that the rest of the country has, and we think ingenuity should be used, and in that situation has been used to get it. Boosters are technically successful. They are used in other communications services. They are available here. I am not claiming that that alone today means that a UHF station is technologically equal to a V because it is not.

Senator POTTER. If all receivers could receive a UHF signal, there would be more emphasis upon the technological development of both the transmission and the receivers to receive the signal.

Mr. HEFFERNAN. That is right.

Senator POTTER. To give the signal and receive it.

Mr. HEFFERNAN. That is exactly right, sir. As we said in our statement, if all receivers today could receive all UHF stations as they can receive all VHF stations, I do not think we would be here.

Senator POTTER. That is correct.

Mr. HEFFERNAN. The problem is circulation; the principal problem of UHF is circulation. That is the principal problem, and the key to that is excise tax relief because that will mean that in the long range that problem will be licked.

But time is of the essence. I am glad Senator Schoeppel brought out that unless we act at this session of Congress there may not be anything to act on later.

Senator POTTER. What would happen if Congress did not act in this session on the excise tax problem? You folks manufacture sets. Would the competitive forces operate so that you would have to manufacture your color TV sets in just the V channels?

Mr. HEFFERNAN. Dr. Engstrom has pointed out that the competitive forces are already driving us to that. You see, one reason that we, up to this year, were able to manufacture all-channel color sets is that there weren't, really, virtually any manufacturers that were making color sets except RCA, so that the competitive factor was not operating, but now it is operating. He pointed out in his statement that that factor is already here, so it is no longer possible to expect that all color sets made in the future will be all-channel unless we get excise tax relief, because we are tooling up for production right now on the basis of V-only color sets as well as volume production of all-channel color sets. We are tooling up now, but if we get excise tax relief soon, we would retool and sell nothing but all-channel color sets.

Senator POTTER. And I assume competitors would have to do the same thing.

Mr. HEFFERNAN. If we got excise tax relief there is every reason to suppose it would then be uneconomic to make anything other than all-channel color sets, which is just the reason this proposal is made. The result is then automatic, and the UHF operator, while he is not presently out in the clear, he sees light, he sees the solution. It is there. It is a matter of time.

Senator SCHOEPPEL. Anything further, Senator?

Senator POTTER. No, sir.

Senator SCHOEPPEL. Thank you very much for this most enlightening statement. As I understand, these proceedings will be recessed, or at least subject to the call of the chairman, until the week of April 23, and at that time I understand those interested in the subscription television situation will be given an opportunity to be heard.

Mr. HEFFERNAN. Thank you very much, gentlemen.

(Whereupon, at 11:59 a. m., the committee adjourned subject to the call of the Chair.)

ALLOCATIONS TESTIMONY RECEIVED IN LATER HEARINGS

At the conclusion of the testimony on March 28, 1956, the major bulk of the testimony on allocations matters had been completed. However, certain additional testimony relating to these problems was heard during subsequent hearings which were devoted primarily to questions concerning subscription television and certain network practices. This later testimony is printed at this point in order to bring all the material on allocations into as close relation as possible.

For written statements filed with the committee and other communications pertaining to allocations see the appendix at the end of this volume, beginning on page 1009.

The testimony of each later witness who addressed himself to allocations and related matters is set out below, with such notes or surrounding material as may be necessary to fix its setting. The witnessess are:

1. Bill Hoover, KTEN, Ada, Okla., who appeared on May 14, 1956 (and in connection with his testimony, a letter from P. A. Sugg, WKY-TV, Oklahoma City, Okla.).
2. Benedict Gimbel, Jr., Philadelphia Broadcasting Co., who appeared on May 15, 1956 (and in connection with his testimony:
   (*a*) Testimony of Leonard H. Marks, counsel for FM Broadcasters, who appeared on June 11, 1956;
   (*b*) Letter from Mr. Marks inserted in record on July 17, 1956; and
   (*c*) Letter from Morton H. Wilner, counsel for Triangle Publications, Inc., inserted in the record on June 11, 1956).
3. Henry B. Walker, Jr., On the Air, Inc., Evansville, Ind., who appeared on May 15, 1956.
4. Chairman George C. McConnaughey and other members of the Federal Communications Commission and its staff, who appeared on July 17, 1956.

TELEVISION INQUIRY

MONDAY, MAY 14, 1956

UNITED STATES SENATE,
COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE,
Washington, D. C.

The committee met, pursuant to notice, at 10 a. m., in room G-16, the Capitol, Hon. Thomas A. Wofford presiding.

Present: Senator Thomas A. Wofford.

Senator WOFFORD. The committee will come to order.

The first witness we are supposed to hear this morning has notified the committee that he cannot come at this time—Mr. Skouras. The committee may hear him later. He is unavailable today.

I want to state for the record, before I call the first witness, that Senator Monroney expressed to me his desire to be here today at this hearing, but it was impossible for him to do so because he had a speaking engagement elsewhere. He said that he would be particularly interested in reading the testimony of Mr. Bill Hoover, who is a constituent of his, and a very close personal friend of the Senator.

Will you come around, Mr. Hoover? You are from Ada, Okla., as I understand it.

Mr. HOOVER. Yes, sir.

STATEMENT OF BILL HOOVER, ADA, OKLA., OPERATOR AND MANAGER OF TELEVISION STATION KTEN

Mr. HOOVER. Senator, Bill Hoover is my name. I am from Ada, Okla. I am the operator and manager of television station KTEN; that is, channel 10, designated for Ada, Okla.

The comments and statements that I am going to make this morning in this testimony are based on about 2 years' experience as the manager and operator of a regional or area television station, built and designed originally to serve a wide agrarian area of southern and eastern Oklahoma, which is basically beyond the practical service area of surrounding metropolitan stations. In addition to this experience, I have also managed and operated radio and television stations for the past 10 years.

Now, based on this short history in this industry—or comparatively short history—I know that the suggestions that I will make here today are not an overall cure-all, nor do I at all kid myself that the comments that I will make will solve all of these problems of this vast industry, or that I know all there is to know about this thing—not by any manner of means. But after these statements that I make are improved upon by probably much better minds in this industry, we may have some improvement in the television industry for both the industry itself and the American citizenry.

My appearance before this committee this morning is not designed to be unduly critical of the Federal Communications Commission, as such, and is only to state facts as I see them with regard to network practices and those practices in their behavior toward station affiliation.

Now we will delve into thr~~ee differen~~t areas of consideration: (1) Satellite station operations, its ills, and effects; (2) the coverage quotation practices and how they, as well as the misrepresentations involved, should be corrected; (3) the struggles of an area television station and how the proposals presented in this testimony would insure faster growth and development of television service for all the citizens of our country.

A new evil has reared its ugly head in the television industry. Unless properly controlled, it will soon become a monster of such proportions that none of us within the industry will be able to cope with it. This new evil is the development of satellite television stations. During the thirty-odd years of radio history the satellite station operation was not developed. But, due to the enormous cost of installation and day-to-day operation of a television station, there are those in our country who prefer to run a satellite operation rather than expend the tremendous amount of energy and finances necessary for the development of legitimate local television service as we now know it.

Because the satellite operation is new, the Federal Communications Act of 1934, as amended, to my knowledge, does not contain adequate rules and regulations to cope with the proper policing and development of satellite stations. Of course, where rules do not exist, or you have vague or inadequate rules, there are always those willing to proceed with action based on the vague or inadequate rules, particularly when such action will serve their needs and desires.

There is no successful industry in our American way of life that has attained its success by giving away its product or services, or by selling those products and services at a rate far below the actual cost of production and development. Yet the basic theory and principle behind a satellite television station is just that.

Mr. Cox. In what way would that be true, Mr. Hoover? In order to make it economic at all, since there is some investment involved in the construction of a satellite station, even though their costs of operation are reduced, they must receive revenue in order to make this an economic operation.

Mr. Hoover. True. But the origination of the programing itself—a satellite, due to the low cost of operation, will sell spot announcements, next to the programs that it is carrying on a satellite basis from a parent station. Therefore, not having to delve into the expenses of program origination or negotiations, many times with networks or film companies, they only sell the spots between the shows.

Mr. Cox. In other words, they would derive most of their revenue from spot announcements on their own account carried adjacent to programs of the network station?

Mr. Hoover. That is the basic theory on which they are constructed.

Mr. Cox. Isn't it true in a number of instances the satellites have been constructed by the same interests owning the parent station and they have then adopted the practice of selling the coverage of the two stations as an entity, both for sponsored programs as well as for spot announcements?

Mr. HOOVER. That is true, but the additional cost for the satellite is not proportionate to the charges that would be necessary if that satellite had to maintain its own sales organizations, if it had to generate its own local shows, and so forth.

In other words, it is only a percentage—in many instances a small percentage—of additional charge for the satellite, something that couldn't be coped with by a local competitive station.

Mr. COX. And by that you mean by a station that was going to make a real effort to provide a local program service?

Mr. HOOVER. That is right. Now there is one other point about satellites which was basically covered by the question, and that is that the big television station who finds a weakness—a metropolitan basic network station who finds a weakness in his coverage area, a soft spot someplace, is the one fellow in this industry who is in the best position to develop a satellite operation. And that only leads to the one big problem that is before this committee, and frankly, before the entire industry, and that is the fact that the big ones keep getting bigger and the little ones find it next to impossible to exist.

Now here, for example—and I think this will show the point that you wanted to clarify—how a satellite operation will work: Let's take, for example, there is a basic network affiliate in a metropolitan area that has a tremendous tower—1,000 or 1,500 feet—with maximum power on its given channel, and this station finds that its signal, in a given segment of its fringe area, is being squelched or being interfered with by a signal generated by another station either on his channel or on an adjacent channel.

Now this basic network affiliate does not become particularly concerned about this loss in coverage initially. But about the time that a local or regional television station is built to serve this area that is in the interference segment of the metropolitan station's coverage, and about the time this local or regional station begins to point out the weaknesses of the metropolitan station and begins to attract regional, national and local business, about that time is when the basic metropolitan station really begins to get around. He becomes concerned about the service in the interference area and he is completely sympathetic with the unfortunate people who have been losing the programing that they justly deserve. In fact, he becomes so concerned that he is willing to make his programing available to persons who would like to own and operate a television station, and to whom possibly a channel has already been allocated, in the questionable fringe area.

He then encourages the development of this second station in the fringe area, and offers—for the public good, of course—to feed his fine network programing to the newly developed station on a satellite basis. He may even allow the advertiser to be charged a small rate for this additional coverage, but since the satellite is receiving so much programing and services and sales energy from the basic station, there generally goes along with all of this service a small service charge through which, in the final analysis, the major portion, if not all, of the profits from the satellite go back to the basic station.

Mr. Cox. This is a charge, you mean, that is exacted by the parent station for providing this?

Mr. HOOVER. It could be, and generally—well, you can see the business arrangement: "We will make these available to you and we will sell for you. We are doing all of this. We need a little service charge out of this thing."

Therefore, the satellite gets money, a small amount of money, but by the time he has paid back his service charge to the basic station for the energy it was going to expend selling itself anyway, then a good percentage of the profits of the satellite have accrued back to the basic station. Consequently, the essence of this whole thing is that the basic station has found itself a crutch whereby it can cover an additional area, control the satellite, and break the back and spirit of a local or area station in the questionable fringe area.

Now this, to my way of thinking, is unfair competition, and is not in accordance with the intent and spirit of the Federal Communications Act, as amended.

Mr. Cox. Are you going to develop later the way in which the creation of this satellite has an impact upon the operations of a truly local station in the area? Do you discuss that at a later point in your statement?

Mr. HOOVER. Yes; I will.

Now with regard to the networks and their attitude concerning satellite operations. I believe it has been conclusively proved by this committee that the networks are dedicated to the proposition of covering the United States with as few stations as possible. If there is some sparsely populated area which does not receive service, then that area will just have to struggle along without service.

Mr. Cox. What of their argument, Mr. Hoover, that it is necessary to attempt to get this coverage from a few powerful stations in order to make television a competitive medium, as far as advertising generally is concerned?

Mr. HOOVER. What is wrong with having competition out in the sparsely settled areas, just as well as having competition in the metropolitan areas? It doesn't add up that competition can only exist in just the metropolitan areas, sir.

Mr. Cox. I think the point they try to make is that the cost per thousand goes up in a more sparsely populated area, and that this renders television competitively unequal, as far as magazine, newspaper, or radio is concerned; and that it is, therefore, impossible to develop a television service on as broad a basis, for instance, as we now have radio service.

Mr. HOOVER. I would like to answer that a little bit later when I get into coverages, because I will show how, if each station is paid for its actual coverage, then there will be some left for the fringe area. I would like to get into that in the second phase, if you don't mind.

Mr. Cox. Fine.

Mr. HOOVER. Since the basic station in the metropolitan area is such a lucrative property for the network, the network, rather than offend its affiliate, will readily agree to allow the affiliate to feed its fine programs to the newly born satellite, in the public interest, convenience, and necessity. In doing so, the network knows full well that the actual profit and coverage of the satellite will ultimately accrue to the basic network station, which will enable the network to maintain its principle of "coverage of the United States with as few stations as possible," because the 2 then are considered as 1, as you see.

Of course, the local station, which had been knocking on the doors of the networks for months and months and months, requesting affiliation as a legitimate local service to the citizens of the area in question, can be told: "We don't need you; we have coverage in that area," and the big squeeze is on.

Mr. Cox. Now is it the current practice of the networks to regard satellites as additional affiliates of the network, or do they——

Mr. Hoover. Well, it can be molded into the coverage of the basic station. It is a lump, if you please; or filling out a hollow spot. There is one thing I would like to point out right here in favor of the networks right along this line, and that is that I sincerely believe that in many instances, the networks would prefer to affiliate the local or area independent station in preference to a satellite station, if it were not for the tremendous pressure applied to the network by the basic affiliate, and particularly by a basic affiliate in a city where there are less than three VHF outlets.

A network, you know, must get along with its affiliates in the principle cities, or the affiliate in a principal city where there are less than three VHF outlets can reject the network's programing in favor of another network which is anxiously waiting just to get his programing into that market. So all of the ills of the satellite problem cannot honestly be laid at the door of the networks. In fact, if the proposals that I will present here later were adopted, the networks would seldom be put in the awkward position described above. And they are definitely put in a very awkward position.

Now there are those who will point out that the satellite arrangement is a desirable one to help a new station get started with good programing, thereby enabling that station to develop a larger, more loyal listening audience. And when the day comes that finances will permit, the satellite can then convert to a legitimate local operation.

In my opinion, this is a supposition and will not happen for two reasons. First, the basic network affiliate does not intend to allow the satellite to get from under its control and domination. Second, a new station is much like a new baby—unless it exercises and remains active, it will not grow. The same is true of a satellite station. Unless it actually endeavors to render the local service it should—producing its own newscasts, weather programs, farm programs, and local-service programs—how can it ever expect to grow strong and self-sufficient? This promise of future growth and development to an independent status is shallow.

The comments made to this point might lead the committee to believe that I feel there is no situation where a satellite station operation is justified. That is not necessarily so. There are, no doubt, areas in the United States which cannot honestly support or justify a full-fledged television station. In those instances, where the people have no service at all, then the satellite type of operation may be the answer. However, my position is this: That the FCC should immediately develop specific rules and regulations with regard to the granting of construction permits for such operations.

Mr. Cox. Now in that connection, Mr. Hoover, is it your position that if an area has one local station, and it could support an additional station of its own, that it would be improper by means of a satellite station to bring in further program choices to this area by feeding in the programing provided by stations in remoter cities?

Mr. HOOVER. That is right. In other words, where one station can exist in an area and render good solid local service, not only in programing—network programing, and all types of programing—but the local service that every area or community of any size at all should have, by bringing in or allowing a second station to come into this area as a satellite, not on an open competitive basis—anybody has a right to get in there and just wade right down the middle competitively—but as a satellite, developing unfair competition to the point that the satellite can ultimately kill the local services, then are the people any better off? Not at all. In fact, I think they are not as well off.

Mr. COX. Would it be your position that this one local station can at least provide the cream of the programing normally, because if it is recognized it will be able to get a selection of programs from all three of the networks?

Mr. HOOVER. That is one thing. The other thing is that as the area then grows and develops and becomes more saturated with sets, you know and I know that there is always an opportunity for a second independent, legitimate facility to be developed, because, sure, one station cannot handle all of the programing from 2 or 3 networks. And as the area becomes more recognized nationally, there will be the available space and opportunity for the development of your second local, legitimate, competitive, television station.

Mr. COX. Now on this point of the development of the satellite station into a true local station, would you care to comment on the position, I believe, of the Federal Communications Commission, that they feel that in the future years they could condition the renewal of the license of the satellite by requiring it to institute increasing degrees of local programing services?

Mr. HOOVER. Well, I would like to point out that actually there are such loopholes in the rules as they now stand—of course, understanding that these satellites are a new problem—there are such loopholes in our existing rules that literally and actually a station can be developed, apply for a regular construction permit as a legitimate station, it can build a little studio, actually buy a camera and have all the appearances of a local legitimate station—but principally and basically and for all practical purposes it is a satellite—and never call itself a satellite. That is the point that I am getting ready to make here in the suggested rules that would control this thing, sir.

Mr. COX. Well, now, however, when it comes up for a renewal of its license, isn't it going to be required to make a showing as to the nature of the programing it is furnishing?

Mr. HOOVER. That is right.

Mr. COX. And that would reveal the fact that it had actually been operating as a statellite and might then involve it in difficulties about renewal?

Mr. HOOVER. Except for the fact that the rules delving into—and the program percentages on the present FCC application delve into network programing and local programing, and educational, and talks, and news and that sort of thing. The programing will be balanced. It will be just as balanced as the basic station. It will make a fine report as far as being balanced, fine service. The only thing is it has siphoned this fine programing from the basic station—except for that occasional local show that it will fire at the studio, with loaned personnel, and do an occasional show to justify local service, you see.

In essence, it is still satellite to the principal metropolitan station, the basic metropolitan station, and it is a crutch to that station.

Mr. Cox. For the record, however, isn't it true that satellites are presently recognized and licensed by the FCC under a rule that was instituted, or adopted, in August of 1954 or 1955? They do have a rule under which these stations are recognized?

Mr. Hoover. There was a rule change proposed—a rule proposal made at the FCC. The final adoption of that rule, I am not sure of.

Mr. Cox. Well, that may be it. It may be that this is simply a proposed rulemaking proceeding at this stage.

Mr. Hoover. That is right. In other words, even if we were to get what rules they are planning on making final finalized, that would be something, at least, toward stopping the development of satellites as a crutch to a basic network affiliate that wants to add to its coverage and break the spirit of local service that is beginning to encroach upon his vast domain. Now here is my proposal to solve this problem.

In the first place, many people find fault but if you ask them for an answer, there isn't any. Well, I don't want to be among that number. It is my opinion that FCC rules and regulations should be developed and adopted which call for official FCC approval for any station to operate as a satellite to another station. The definition of a satellite should be construed to mean——

Senator Wofford. May I interrupt for a minute? Do you have any objection to these photographs being taken? [Indicating photographers.]

Mr. Hoover. No, sir.

Senator Wofford. All right, go ahead.

Mr. Hoover. The definition of a satellite should be construed to mean that when any station accepts programing, either network, local, live, or film, from another television station via any connecting facility, whether it is off-the-air pickup, microwave relay, or coaxial cable, in excess of—and here is the meat of it—in excess of 8 hours of programing per week, the station receiving such programing in excess of 8 hours must declare itself a satellite and obtain FCC authority to operate as such.

Now let's analyze just this one point. If an application is made by Station X to operate as a satellite to Station Y, and this service can be delivered without developing unfair and undue competition to already existing local operations, naturally there would be no one to protest the granting of the application by the Federal Communications Commission, because the people weren't getting any service in the first place. They would want some. So the application would go right on through.

On the contrary, if Station X's application to operate as a satellite is actually an effort on the part of a basic network metropolitan station to increase or improve its coverage, using the satellite as a crutch to do so, and this action would work to the detriment of an existing local station in the area, to be sure, upon public notice of the intent of Station X to operate as a satellite to Station Y, there will be a vigorous protest on the part of the local station that will be hurt in the process. Then, after proper FCC hearings on the matter, the Federal Communications Commission must decide whether the satellite proposal is in the public interest, convenience, and necessity. In other words, we just should have a day in court to determine whether the development of this satellite is really in the public interest. Then if the Commission feels it is, fine; but there ought to be a way to bring the thing up for hearing. And this would surely be an opportunity to do that.

The reason for using 8 hours of programing per week as the basis for determining whether a station should be classified as a satellite is because many times there are public service programs originated by one station which can be picked up by another station in the same general locality. This particular public service program could be delivered to the public with convenience and to the overall good of the public. There are times when special sporting events are originated, and arrangements are made whereby a second and third station may carry the same program. It is my feeling that the 8 hours per week would allow for the normal amount of cross-station feeding of programing that exists today. Therefore, when you get over that you begin to get into this satellite thing.

There are those who will say that such a rule will be destroying the principle of network programing because, in essence, they try to stretch this thing that network programing is taking programing from one station to another. But I am sure as the details of the rule would be written, they could be definitely differentiated between network programing. Further, they contend that delving into network programing and station programing in general—the FCC just should not delve into that sort of thing.

On the contrary, the FCC in my opinion has a positive and specific responsibility, under the Federal Communications Act, to police the allocation and operation of any and all radio and/or television stations utilizing frequencies now designated and allocated to the United States, and to make sure that these facilities are utilized to the fullest extent for the good of the American people under the American free-competitive enterprise system. Actually, this proposed rule to police the development of satellite stations would be an effort on the part of the Federal Communications Commission to make certain that the spirit and intent of the FCC Act of 1934, as amended, are carried out to the letter, and that as many citizens as possible will have local television service. I, therefore, believe that the adoption of such rules by the Federal Communications Commission is in the public interest, convenience, and necessity.

If you find the statements and thinking in this testimony to be true, correct, and logical, I believe this committee should take immediate steps to request of the Federal Communications Commission that it develop and place in action, at an early date, specific rules and regulations with regard to satellite operation of television stations.

I do not know whether this committee intends to complete its investigation before making certain specific recommendations to the Federal Communications Commission, or whether the committee has considered making a series of interim recommendations and proposals to the FCC for immediate action. I am inclined, as were many who have appeared before this committee, whose testimonies I have read, to urge quick and immediate action. I, therefore, join my voice with theirs, to request that this committee take under advisement the possibility of development of interim suggestions and proposals to the FCC for immediate action, prior to the development of its final report, remembering that time is of the essence in this fast-moving television industry.

So I want to request that this committee consider the possibility of filing a request with the FCC at an early date based on this satellite problem. That basically concludes my comments with respect to the satellite stations and their ills.

Mr. Cox. Now, in that connection, Mr. Hoover, you have, of course, developed this in general terms. Could you tell us whether such a situation actually exists in your area in Oklahoma and actually affects your station, or potentially could affect your station?

Mr. HOOVER. The answer to that question is "yes"; there is a situation developing in our area.

Mr. Cox. Could you tell us something about the details so we could pinpoint the case?

Mr. HOOVER. When we get into our maps here in just a few minutes, I will ask you to make a special note to look at the maps of WKY–TV, Oklahoma City, and in that way, I can show you in a graphic manner what I am talking about, or I could go into it now, whichever you prefer.

Mr. Cox. I think you can reserve it, except I take it that the situation is that WKY is a station which you feel proposes to assist in the development of a satellite, and that that satellite would then have injurious effects economically upon the operation of KTEN.

Mr. HOOVER. That is right. But I want to further amplify it with the maps here in just a minute.

Mr. Cox. All right.

Mr. HOOVER. Now the second area of consideration, on the surface, seems far removed from this first consideration. Actually, it attaches itself to the first problem, as well as many other problems now before this committee and the television industry. There are only so many advertising dollars in America, and, frankly, they make a very, very nice pie. The television industry's slice of that pie is quite large, but as Senator Bricker in his report of a week or so ago pointed out, only the crumbs of the crust of the pie ever seem to reach the hands of the area or local television station. Consequently, without income, local and area television stations have not grown and developed as they should have. Their future growth and development is being impaired, and it naturally follows that the American public is not getting the television service it could and should have.

One of the elementary reasons why the advertising dollars are not reaching the area and local stations is because the presently existing coverage maps and standards, submitted to the Federal Communications Commission—and used in the selling of time by the television industry—are theoretical in scope. They are not factual, and in many instances are basically misrepresentations of coverage. In the beginning of the development of the rules, regulations, and standards with regard to the television industry, the FCC maintained an official attitude of making the filing of applications and the engineering data pertaining thereto as simple as possible. I believe it is an official attitude of the FCC that they do not intend that their standards be construed as specific coverage areas of stations, but rather that these coverages be used as a basis for determining overlap and duopoly and that sort of thing, for administrative purposes of the FCC. However, regardless of what the FCC's intention was for the present standards, the fact remains that the coverage areas filed with the Federal Communications Commission in accordance with the present standards are used as sales vehicles and are used as a basis of having FCC sanction and approval. In other words, whether the Commission wants to be charged with the responsibility of designating the coverage area of stations or not is beside the point. They are, just because they are in an official capacity which they have with regard to this industry. Even though in many instances it is an established fact that the perfect circle shown on these maps does not accurately represent the actual coverage of the stations involved.

In the beginning of the television industry, I am sure the FCC thought that each station would send out a signal from its antenna in a uniform manner in all directions. I am also sure that the FCC thought a signal could not be received with any degree of satisfaction beyond the class B contour. Now that we have had several years of experience and we now know the facts, why should we, as the television industry, continue to operate under antiquated and inaccurate theory. There were those in the FCC, in the early days of television, who were actually on the right track, but lost the battle because standards of engineering practice with regard to the coverage area of stations as set out in the third report, issued March 22, 1951, were not adopted as the standards to be used.

The standards set forth in the third notice were not developed overnight, and were not developed by people unfamiliar with the facts of this industry. Actually, the third report required nearly 2 years of research, hundreds of man-hours of work, and involved the finest technical minds in the industry and in the Commission, working as a team. The standards set forth in the third report took into consideration cochannel and adjacent channel interference factors. Today, with the growth and development of more and more television stations, as well as increase in height—increase in antenna height and things of that sort—these factors prove to be an important problem to the advertiser and the industry.

In fact, a close check will reveal that a large percentage of the television stations in the United States do not put out a receivable signal uniformly in all directions from its antenna, even though the coverage maps submitted by stations to the advertisers and their agencies will, 9 times out of 10, show such uniform coverage. The majority of these maps are given to the advertiser on the statement that this is the coverage of the station, according to the FCC and the maps on file there. So long as such misleading maps are given official sanction—whether intentional or unintentional, as far as the Federal Communications Commission is concerned—just so long will stations continue to sell on these misrepresentations of coverage.

Mr. Cox. Now isn't it true, Mr. Hoover, that actually the service area which can be served by a station operating at full power and full antenna height is greater than the area which would be enclosed within the calculations made upon the basis of the FCC standards?

Mr. Hoover. Yes, that is true, and I think testimony has already been presented to this committee in the past stating pretty good evidence to the fact that a 100-microvolt contour out here [indicating], interference free, is a good receivable signal on the average home receiver.

Mr. Cox. Now that is less than actually contemplated by the FCC?

Mr. Hoover. Yes, but here is the catch. The maps filed with the FCC are only shown out to contour B, but the standards of measurement to determine B are also the standards of measurement to determine this 100 microvolt, which everybody has bought now as being an actual thing; so they still just make the circle and make it a hundred microvolts all around, uniform in every direction.

Mr. Cox. That is the circle on their map used for selling?

Mr. Hoover. Yes, but they use this circle and show that the hundred microvolt goes all around, which enlarges the coverage of each station. And it is true where a hundred microvolts is interference free it is a good legitimate signal and a station, I personally think, has a legitimate right to charge an advertiser for coverage out to that point.

Here is how the thing actually works. Station A with maximum power for its channel, located in a metropolitan area, is a network affiliate. This station, according to present coverage maps, has a class C or 100-microvolt contour out, let us say, as far as a hundred miles. I am not using anything specific here; I am using an example. Say it goes out a hundred miles. The station calculates all of the homes inside this hundred microvolt contour. The network also makes the same calculation, and the rate charged the advertiser by the station and/or the network is based on all of these homes inside this contour.

Actually, 75 miles away, let us say, there is station B, on an adjacent channel, with maximum power and a 1,000-foot tower.

Mr. Cox. Would that be the minimum separation required?

Mr. Hoover. 65 miles is the minimum. I will have to qualify that: 65 miles is the minimum in zone II; I do not know about the other zones. That is, where I operate. This station's signal—that is, station B's signal—actually interferes with the signal of station A in a segment of station A's coverage area. In fact, some of the less expensive table-model sets in the fringe area are equipped with a relatively inexpensive antenna system, which is also quite broad-banded in reception. Consequently, station A's signal cannot be received with any degree of satisfaction because of continuous interference from station B, the local or regional station on the adjacent channel. Yet, the networks refuse to accept the fact of interference. Certainly the basic network station A will not admit the interference. The advertiser is misled into thinking he is getting coverage over all of station A's coverage area; he is paying for that coverage, and, basically, he is being cheated.

Mr. Cox. Well, have you, or the operators of other stations who feel they are filling in an area that is interfered with, been able to convince advertisers of the facts as you believe they actually exist?

Mr. Hoover. It is a slow and a tough and a very hard process. It can be done, and there are those—both network people and advertisers—who know of our efforts at KTEN, and it can be done. But it would be a lot simpler for the entire industry just to make the maps factual to start with, and then everybody could receive money for the area they actually cover. That is the point I am making. It isn't right for a station that is first in a sparsely settled area, and has limited income, to have to battle to the extent that we have had to battle to even make a little bit of headway. We are a long way from being there. I assure you of that.

And even worse, in this instance, than the advertiser being cheated, the viewers in the adjacent channel interference area are being deprived of some of the better network programs because the network will not make those programs available to the area station.

Whereas, if coverage maps were developed, based on the station's coverage out to the 100-microvolt contour of interference free area, from both cochannel and adjacent channel factors, the advertiser could then buy and pay for the coverage he is actually receiving from the basic network affiliate. With the reduction in cost of the basic network station, he could take the dollars he has saved by paying for actual coverage only, and buy the same program on the area or local station, thereby giving the advertiser better coverage. And, without excessive increases in advertising expenditures on the part of the advertiser, more people could receive better television service.

Mr. Cox. In other words, you are suggesting that this would produce a reallocation of the dollars spent for television advertising so that the basic affiliate in a metropolitan area would receive only its fair share, but that the diversion of part of those funds to the area station would still not raise the total television advertising expense to an uneconomic point?

Mr. Hoover. Yes; in other words, an advertiser basically thinks of spending X number of dollars to cover a thousand homes in the country. Now if the metropolitan station is actually delivering coverage to only two-thirds of the homes that this advertiser is paying for—actually delivering coverage—although it is getting money for a hundred percent of them, that other one-third, diverted into in-between or local or area stations, would just about cut the mustard as far as giving the advertiser coverage all over the area, dollars-and-cents-wise.

Mr. Cox. Would the funds thus diverted from the metropolitan stations be enough to support stations out here on this fringe, and keep them in business?

Mr. Hoover. Well, I think yes. For example, in my own operation we keep the expenses down quite low. We are operating with a smaller staff. We don't have to have all of the show that a metropolitan station does have to have. We can actually get along on less dollars in our operation.

Mr. Cox. Would this serve to fill in the gap between what you can raise from national spot and local advertising?

Mr. Hoover. That is right; it would aid in the basic problem of any station, better programing. If you get that, you can solve most everything else in this industry.

I am sure all of you gentlemen know that there is a limit to the number of advertising dollars which can be generated for use in television. It is my firm conviction and belief that if those dollars were spent for actual coverage, rather than for theoretical coverage, the television industry would be much stronger financially today; the possibility of the development of better regional and local stations would increase 10 percent; and the American people would have the opportunity to receive more and better television programing than ever before.

To this point I have only described to you what happens in the instance of adjacent channel interference factors. The same situation, basically, exists in the instance of cochannel interference factors. Take, for example, 2 stations 200 miles apart in zone II, both in metropolitan marketing areas, operating on maximum power, utilizing tremendous antenna heights. Almost without exception there is an area between those two stations which receives a signal from both stations. The viewer is trying to receive this direction, and his antenna is headed in this direction [indicating], and at the same time there is a program from another station, on the same channel, on the same set. You cannot receive two programs on the same set on the same channel at the same time, so there is tremendous interference.

But when a local or area station is developed and built to serve the in-between area, the advertiser is not disposed to buy the area station because he has been misled into believing that he already has bought, paid for, and has coverage in the area in question. And he will pull out one of these coverage maps I have referred to, with the big vast circles, and use that as his proof and evidence to you that he has coverage in the area. Therefore, he has no logical reason to buy the local station.

The networks, dedicated to the proposition of covering America with the smallest number of stations, aren't going to go to the advertiser and tell him this interference exists, because the advertiser would then expect the rate on the basic station to be reduced. To be sure, the basic network station isn't going to tell the advertiser the truth, because he fears the loss of revenue. And, as a result, under the cochannel interference situation, the advertiser and the American public are still being cheated. Then, when an area station begins to prove to the advertiser that he is being cheated, we have such situations as I described earlier in the satellite operation, where they begin to develop and fill this hole with a satellite operation.

With these facts before you, I am sure you can readily see why local and area television stations are being strangled to death. They are being deprived of any save the few crumbs from the advertising-dollar pie. If they were being deprived of these dollars justly, it would be a different thing, but actually they are being deprived of them in the most dishonest approach yet conceived in this industry. In my personal contact with advertising agencies up and down Madison Avenue in New York City—when I point out by both map and surveys the interference situation and how they are being hoodwinked—nearly without exception every agency says: "We need so badly this sort of factual information with regard to the coverage of stations." Of course, the local or regional station, struggling for existence, with small revenue and limited personnel, has few dollars to spend in advertising, and only on occasional visits to the advertising agencies is able to tell his story. On the other hand, the metropolitan network basic affiliate station spends enormous sums of money advertising and promoting his tremendous coverage, based on the maps now filed with the FCC. He further has ample funds to send personnel up and down Madison Avenue spreading inaccurate propaganda.

Each network, through its respective sales personnel, wishes to boast of the most powerful station, and the most coverage for its affiliates, in each of the basic markets. So the network salesmen start beating the drum for this tremendous coverage, inaccurate though it may be. What is the advertiser to think? Who is he to listen to? The loud screams of the network affiliates in metropolitan areas, or the tiny voice of the local and area station that is telling the logical and truthful story regarding coverage? Place yourselves in the position of those time buyers, gentlemen. Which story would you listen to? These are the reasons why this committee, if it does nothing else throughout its entire investigation, should force the development of coverage maps based on actual coverage to the 100 microvolt contour of interference free signal. This would accomplish more toward the growth and development of the television industry for the service of all the people of the United States than anything else this committee can do.

Mr. Cox. Is this 100-microvolt contour as satisfactory for stations in the high bands as it is for stations in the low VHF band?

Mr. HOOVER. I operate a high-band channel 10-VHF station. I do find that the viewers out at my hundred microvolt contour say they receive a satisfactory and adequate signal. Now you are asking me an engineering question which, frankly, I am not capable of answering, except to say that in our own experience, viewers state that they are satisfied that they can get a receivable signal at a hundred microvolts.

Mr. Cox. Does this require a more sensitive receiver and any additional expenditure for antenna, or can this be done with medium-priced equipment?

Mr. HOOVER. Pretty well standard equipment.

Now I have had our consulting engineers, Vandivere, Cohen & Wearn, prepare for me coverage maps under the present standards for certain existing areas, and superimposed on those coverage maps, each station's coverage based on the standards set forth in the third notice, which take into consideration cochannel and adjacent-channel interference factors. If you will turn with me to the exhibits attached to the back of this statement, you will quickly see what I am talking about in a very graphic manner.

Now for ease of understanding—and something that you can drive out in your car and check, you folks who live here in Washington—we did a map on your own local station, WRC–TV, right here in Washington, channel 4. Now the outer circle [indicating the map] [1] is the 100-microvolt contour. You will notice that to the northeast WRCA–TV, on channel 4 in New York, renders interference to quite a slice of territory; and there is one point that I have not made through these maps that I would like to make here. If we had the coverage of WRCA–TV's map, we would find the same sort of interference being applied on WRCA as on coverage by WRC.

Now to the southeast you can notice that WUNC–TV down at Chapel Hill, N. C., operating on channel 4, provides interference, and WUNC has interference from WRC. Both of those are cochannel interference factors. Now for adjacent channel interference factors, WSVA–TV over here at Harrisonburg, Va., on channel 3, interferes to a great extent on the west side. Now the number of homes in the white area inside is considerably less than the number of homes in the overall large circle.

Mr. Cox. Actually, this is an unusual circumstance, Mr. Hoover, in that included in even the remaining white area is the city of Baltimore which has its full complement of three television stations, and actually advertisers, in buying coverage in this area, buy both the Baltimore and Washington stations.

Mr. HOOVER. That is right, but it does not necessarily hold when you get out West and in many other areas of the country.

---

[1] It was not possible to reproduce any of Mr. Hoover's maps. However, they will be retained in the committee's files.

Now we went up to Boston [referring to map]. There you have a pretty true circle except for the one big slice taken out of the southwest side—interference also from WRCA-TV.

The next map [referring to map] we dropped out to the Southwest, my part of the country. We have a map here of KRLD-TV, channel 4 at Dallas. You will notice that it receives interference from WKY-TV in Oklahoma City. Both stations are on channel 4, and the 2 stations are basically about 200 air-miles apart, just over the minimum necessary separation for 2 stations on cochannels.

The next map [referring to map] is WKY-TV, Oklahoma City. You will notice the interference from KRLD-TV, the map we just looked at here. It goes up to the city of Pauls Valley. Now my hometown—you will notice Pauls Valley is in the shaded area due south of Oklahoma City—my home is Ada, some 20 or 30 miles east of Pauls Valley. Now compare the population area from north of Pauls Valley down to Sulphur, in the southern stream of the hundred-microvolt contour. Do you see that slice in there [indicating]? Now there is a station on channel 12 that is being developed at Ardmore, Okla. That station is going to operate on about 25,000 watts, which basically will give it about 30 miles' coverage, which will just about reach up to Pauls Valley there—from Ardmore to Pauls Valley. It will just fill in that gap real nice for a fellow by the name of WKY, and Ardmore is going to be an off-the-air pickup from WKY. It is already stated in the newspapers.

Now they have got a studio—they are going to have a studio and they are going to do a newscast once in a while, but it is already openly said that they are going to be carrying the programing—both locally originated, film and network—from WKY.

Mr. Cox. When this Ardmore station received its construction permit, at that time was there——

Mr. Hoover. It was 2 years ago, the same time I got mine.

Mr. Cox. Was there at that time any representation to the FCC that the station would be operated as a satellite?

Mr. Hoover. On the contrary, it states that it will be a legitimate local station. Now the point I am getting ready to make here is this: If the coverage standards as proposed here were adopted, then Ardmore, sitting down here in its position, wouldn't have to go into a satellite operation to WKY or me or anybody else. They could make a legitimate deal with, certainly, one of the three networks and operate a legitimate station.

Mr. Cox. Do you mean because they would be able to sell coverage in this cross-hatched area [indicating]?

Mr. Hoover. That is right, because the advertiser would be told in the beginning, "WKY comes down here to north of Pauls Valley. This is our interference area. Now if you want the rest of this, here is a station you can buy."

Mr. Cox. Now does KTEN provide coverage in at least part of this shaded area?

Mr. Hoover. It provides coverage in the majority of the shaded area. I have saved the worst till last. It is the last map we will look at. You can take a look at the last map [referring to the map] and I think you will see the point we are talking about.

My statement with regard to my own coverage is this: I couldn't show everybody else's weakness and not show my own. I am cut off at least a third, or maybe more, in my coverage area there by KWTV. But if I can only get credit for two-thirds of my service area—and I legitimately deliver service to two-thirds of my coverage area—and I get more for two-thirds of my coverage area, then that is well and good. When you make a rule it has to cut right down the middle and take a little shave off everybody. As you can well see, Ardmore is well inside our coverage area in this Pauls Valley thing [indicating], and I have been getting a good deal of network programs—NBC network programing—on a per-program basis.

Mr. Cox. WKY is a basic NBC affiliate?

Mr. Hoover. Yes. That is why I think this arrangement has grown so rapidly—because we are making tremendous headway in pointing out and proving to the advertiser, "Well, you need us down here." But I have to do it all myself, and have to unsell them on one coverage and sell them on another.

Mr. Cox. Do you concede this interference with your own signal in your sales efforts?

Mr. Hoover. I absolutely do. I have sales coverage maps—my normal sales coverage maps—that I would be glad to show you. In fact, in our market data we only count 18 counties in southern Oklahoma. Our transmitter is at the northern extreme of Pontotoc County and we don't even count Pottawatomie County, which is 10 miles to the northwest.

Now every time I get out on a limb, they saw it off behind me, so I have to tell them exactly what we do cover. All right, you can see the WKY problem. And then here are a couple of other stations in Oklahoma: KTVX, an ABC affiliate, between Muskogee and Tulsa, which suffers interference; and KWTV, the CBA station in Oklahoma City, which gives me interference, and I give him interference, and Muskogee gives him interference, and he gets just a little bit from Wichita, Kans. But you can see from these maps what I am talking about, gentlemen [referring to maps].

Mr. Cox. Now these, I take it, Mr. Hoover, are still, however, simply engineering calculations based on average standards, without reference to actual conditions in the field?

Mr. Hoover. These are calculations as set forth in the third notice—the standards of calculating the figures based on the station's antenna height, its power, the interfering station's antenna height and power. All of that is already set out in this third report.

Now, for me to argue that this is the exact figure and ratios to be used that were set up in the third report—and whether they hit the line just exactly right or not, I am not capable of making that statement. I am simply saying that interference factors—both cochannel and adjacent channel—do exist and they should be calculated, and the third report looks to me like a mighty good start in that direction.

Mr. Cox. It still would be possible that no matter how these standards were refined, under actual conditions, reception could be obtained in areas which would apparently be in interference zones, and in other cases the interference zones might be larger?

Mr. Hoover. I submit to you the fact that radio for 30 years has been figured that way, and they hit it pretty close.

Mr. Cox. I note on your map for the coverage of KWTV, in Oklahoma City, you indicate that the interference by KTEN is sufficient to prevent that signal from being satisfactorily received in Ada. Now, are there sets in Ada which actually get a picture from KWTV?

Mr. Hoover. That is true. There are sets in Ada that can actually receive KWTV, even though this interference line shows that they cannot. Now, these sets are the fellows who have an exceptionally good television set—an expensive one—with an exceptionally good antenna system with a rotor, whereby they can do sufficient turning and adjusting to cut KTEN out. Now, I believe the last survey, taken in January, shows about one-third of the people can watch KWTV. Another thing about this one-third percentage, that was actually taken by telephone survey, it was based on an all-day proposition, and we weren't even on in the morning. So naturally when we are not on, it is just as true as can be. When KTEN is not on, it is just clear as a bell in Ada. But we are on from noon on, and we expect to get back to sign-on in the morning, just like any other station, as we grow and progress.

Mr. Cox. In other words, there is an additional factor which is not taken into account in these calculations, which is the angle between the two transmitters?

Mr. Hoover. Absolutely. In other words, an antenna faced basically toward Oklahoma City that is in such a location that KTEN's signal hits the front of that signal, KTEN will render tremendously more interference to KWTV, or vice versa, in either instance, than it would render if this home set were around so that KTEN's signal only hit the little round end of the antenna instead of the face of the antenna, where it should hit. So to stay up to this line is one thing, and from here on is another; you cannot do that in this industry. It is shades of gray down to black from white to black. You can't make any one flatfooted statement. But when in doubt—the way it sets now—when in doubt, give it all to the basic network affiliate. and then if there is any more doubt, we will add a little bit more to them.

All I am saying is: Let's get some facts on this coverage area, and then let the advertiser pay for the coverage he legitimately is getting from each station, and this industry will be healthier.

Mr. Cox. Now, these calculations that have been made here by your engineers are based on the standards of the third notice?

Mr. Hoover. Yes, sir.

Mr. Cox. Which, as I recall it, are based on the assumption that interference exists where the signal strength received from the two stations is equal. Now, is there a possibility that that standard is too conservative; that you could get interference-free service in this shaded area because of the application of a different factor—a factor, say, that if the ratio of the desired to the undesired signal were such that there was 10 decibels greater strength—that you could get a reduction in this shaded area?

Mr. Hoover. Well, I think you are trying to get across to me and ask me are these standards exactly precise and correct, or can they be improved upon, due to better equipment today I am not an engineer. I can't answer positively. I am inclined to believe that the standards set forth in the third report, it would be well to reevaluate them. But whatever that reevaluation is, in the light of all of the experience since 1951 and the improvement in reception and antenna gains, and that sort of thing—whatever that is, let's find out what the interference factor is and put it down and sell on that basis.

As I started previously, anyone can put his finger on a problem. The thing needed here is to aid in the solution of the problem. I, therefore, respectfully request that this committee take immediate steps to aid and encourage the FCC to immediately adopt the standards of engineering with regard to coverage area as set out in the third report—and I should qualify that by adding, studies made based on the third report and in the light of new developments—taking into consideration cochannel and adjacent channel interference factors.

Now, there are those who will say that such action will throw the television industry into a turmoil, and will call for a complete new set of market evaluations, and so forth—they can give you many reasons. It is true that the development of honest coverage maps would necessitate the addition of a number of television stations to various networks, in order to deliver to the advertiser the coverage he has been led to believe he is now receiving. It is also true that it may be necessary to reduce the rate now enjoyed by some of the metropolitan basic network stations, because they are charging for coverage they are not now delivering. It is also true that this will make for a headache for the advertising agencies, their research departments, media directors, and time buyers; but I believe that almost without exception these people, charged with the responsibility of buying the most coverage for the advertiser's dollar, will be most happy to be furnished with honest coverage maps rather than misleading big fat circles.

Just watch, gentlemen. Those who will cry the loudest and fight the hardest against the adoption of the proposal here today will be the ones who stand to lose a buck. They will be the ones who lack foresight in the growth and development of this tremendous industry. They will be the ones who will label themselves completely disinterested as to whether all of the citizens of America should have good television service. The ones fighting this proposal will be the fellows who have got the buck—the big piece of the advertising pie—and who do not want to share it with any one, nor do they intend to if they can help it.

Gentlemen, you can expect the networks to throw their support behind them, because the opposition will be from the basic network affiliates in most instances. I am not necessarily saying that the networks will throw their support behind the opposition of this proposal because they want to, but because they feel they must support the fellows on their team.

In summarizing the first two points of this testimony—it is human to make errors. At this point I want to say that I, personally, do not believe that the Federal Communications Commission, in the errors it has made, has made them intentionally. In fact, I believe the rules and regulations as they are written today were written in good faith. But when new problems arise, new rules must be written to correct them.

The problem of satellite operation has been basically nonexistent until now. But the satellite problem exists because of present loopholes in the FCC rules which allow an applicant to apply for a legitimate television station, and then, after receiving his construction permit, arrange for programing on a satellite basis through a letter of agreement, which does not have to come before the scrutiny of the Federal Communications Commission, and go on the air as a satellite—thereby operating as a crutch, in many instances, to a basic network affiliate, as described at the beginning of this testimony, and not in the manner he promised the FCC he would operate his station in his original application-for-construction permit.

To say that the loopholes exist due to error or lack of foresight would be incorrect, but to allow such error to prevail in the face of the points made here today would certainly be a lack of foresight. Due to the normally slow development of FCC rule changes and additions, it is of the utmost importance that this committee encourage the FCC to move with extreme rapidity toward the solution of the satellite problem.

The same statements made with regard to satellites can also be applied to the FCC rules regarding station coverage. Now that fact and experience are available to the FCC, it is sheer folly for this industry to continue to operate under theoretical coverage maps instead of accurate, honest maps; and unless this committee, through official action, pushes hard on the FCC to take immediate action on this very important problem, more and more damage will result to our industry.

In summary of these points, human error can be understood and forgiven, but to allow human error to prevail when conclusive evidence is available and changes must be made, is sheer folly.

The third and final area of consideration in this testimony is one near and dear to my heart, namely, the struggles of an area or rural station for existence under the present standards. Whether one is operating a rural station or a basic network affiliate, there is one factor upon which the success or failure of any station depends. That one thing is programing—quality programing that will attract and hold the interest of the public. The public will tolerate an exceedingly poor picture in order to see the program it desires. A local or area station does not have the talent, nor money, available to independently initiate programing of the quality to captivate the interest and attention of the viewing audience for long periods of time. Therefore, the availability of network programing is of the utmost importance in the success of a rural or local station.

With the attitude of the networks in general, and particularly those described by Senator Bricker in his report, it is virtually impossible, for an area station to develop a satisfactory network contract. This statement is particularly true when the area station lies within the fringe area of a basic network affiliate, because then the area station must fight not only the "few station attitude" of the networks, but it must also fight the power and prestige of the basic network affiliate which has the ear of network personnel. Then, of course, as I have pointed out previously, as long as a metropolitan station can, through inaccurate coverage maps, mislead the advertisers into thinking the coverage of the metropolitan station is one big perfect circle, why should the advertiser pay for the same audience twice—once on the metropolitan station and again on the local station? As long as coverage maps based on the present standards are used as official coverage areas of stations, the area or rural station will have a tough time convincing the advertiser of the truth.

Another problem which an area or local station is forced to cope with in regard to selling network advertisers is this: After the station has successfully completed a selling job and the network advertiser has agreed to buy the program on the local station, in many instances the network sales personnel will actually endeavor to "unsell" the advertiser on placing the program on the local station.

Mr. Cox. Has this been actually reported to you in cases involving your station?

Mr. Hoover. I will simply say that it was official at one time—and I will later cover that—that that was going to be the intention. "You can go out and sell all you want to, but we are going to counsel with the advertiser to see if it is really wise to buy your station."

Mr. Cox. Which network made these statements?

Mr. Hoover. That was CBS. However, they have changed that—and I am making that point later. They point out to the advertiser the folly of spending the extra money for coverage which—according to network figures, maps, and their research departments—the advertiser already has through the purchase of the basic affiliated station. And at this point the network sales personnel will pull out the maps referred to earlier, showing a tremendous circle of coverage, but which does not take into consideration adjacent channel and cochannel interference factors, and show the advertiser why he need not buy the local station.

Naturally, the advertiser, having done business with the network for so many years, finds it difficult to believe the sales talk of the local station as against the word of the network's research department, and thereby many, many times orders will be killed even after a good selling job has been done.

At this point I should like to say that just recently the CBS network has amended its attitude toward the local or area stations. They now point out to the advertiser that the local or area station will, according to their calculations, add only X number of homes to the advertiser's viewing audience, and they leave the ultimate decision to the advertiser as to whether the extra number of homes—which I believe is minimized by the network—is worthy of an order.

Mr. Cox. What is the station rate which your station now charges for programing?

Mr. Hoover. $150 per nighttime hour for network.

Mr. Cox. Now, do you know what set count is conceded to your station by the various networks?

Mr. Hoover. They change from time to time and, of course, in most instances, I am not notified of the network's calculations.

Mr. Cox. What is your claimed set count for your effective service?

Mr. Hoover. I have made a practice of utilizing the figures set out in Television magazine, sir. When I first started selling advertising, I got the Manufacturers Association's figures, county by county, and would add them up, and that sort of thing, and I would go into New York and quote such and such a figure that I thought to be correct. And people would pull out a magazine and look back through there and say, "Well, this says you have only got so much." So I gave up trying to argue and qualify that. I just use the other figures and seem to get along with TV nicely, sir. In other words, if I use the other fellow's figures, I don't have to justify them, in the first place, and if

I deliver more than the other fellow says I am going to, I have a happy advertiser and I keep him.

Mr. Cox. What figure does Television give you?

Mr. Hoover. It gave me 91,000 sets in the most recent issue I can remember.

Mr. Cox. Is that based on the full circle or does that take into consideration interference?

Mr. Hoover. They do take into consideration programing and other signals coming into the area, and that sort of thing. I am not qualified to go into the formula that they use to determine these sets, but it must have some authenticity because so many of the folk of the industry will accept the figure as a reasonable one—and after all, that is the true value of the thing.

One other point in this regard—the networks, in taking this action of unselling the advertiser, do not always necessarily do so because they want to, but because they feel they must in order to maintain harmonious relations with their basic affiliate. And, in theory, they point out that it is not fair to charge an advertiser twice for the same coverage. To this point I agree. But it is fair to let the advertiser pay the station which delivers the coverage, rather than pay the network's basic station and let the area station go hungry.

Then there is the agency that buys time in behalf of the advertiser. The agency's personnel is human—just like you and me. They are subject to human habits, such as you and I. Yes, advertising agencies, time buyers, and research departments many times buy on a habit basis—and that habit buying has been on the basis of metropolitan basic network affiliates. It is as hard to break a buying habit at the advertising agency as it is to break yourself of a personal habit. This tends to become a problem for the local station. But if, after perseverance, the local station begins to make too much headway—begins to get too many national advertisers—begins to drive the truth home about metropolitan coverage—then he must worry about the development of a satellite operation in his own backyard which will be controlled by the basic network affiliate. Then all of the truth and fact which he has presented to the advertiser goes out the window in favor of the satellite.

At this point, I will simply say that it takes a brave soul to apply for, build, and operate a legitimate local or regional television station in the face of such odds. However, if the suggestions and proposals set forth here today were expedited and developed into official acts by the FCC, the life of the local or regional television station would be a more tolerable one. Certainly the prospects of success would be increased enough to justify more citizens of the United States to invest their dollars in the building and operation of local and regional television service—and that, I believe, is the basic goal of the FCC Act, namely, to have as many people as possible over the United States receiving good, local television programing and service.

As a regional television operator, already caught in the vicious vice previously described, I have dedicated myself to the proposition of doing all within my power to get the rules and standards by which we must operate our stations adjusted and amended to the point that local television service can be developed community by community over this country.

Gentlemen, I wish to express my sincere appreciation and thanks for the time and interest given me in behalf of rural, area, and local television operators. Only in America, under our form of government, could the underdog be heard—and under the present standards, the rural and area television stations certainly are the underdog. Only in America could our problems be presented, and could we expect serious, wholehearted cooperation and consideration to be expended in the solution of our problems. It is my sincere and honest belief that a quick adoption of the proposals I have discussed would help materially in a rapid and successful growth of television service to many, many more citizens of these United States, and none of the proposals will be at the expense of any just person, cause, station, or network.

Thank you.

Senator WOFFORD. Thank you very much, Mr. Hoover, for coming to testify. We shall take a recess for about 5 minutes.

(Recess taken.)

(The maps referred to by Mr. Hoover are on file with the committee.)

[Inserted on June 11, 1956, with its enclosures]

TELEVISION STATION WKY-TV,
Oklahoma City, Okla., May 22, 1956.

Hon. WARREN G. MAGNUSON,
Chairman, Committee on Interstate and Foreign Commerce,
United States Senate, Washington, D. C.

DEAR SENATOR MAGNUSON: It has come to the attention of WKY Radiophone Co., licensee of WKY-TV, Oklahoma City, Okla., that on May 14, 1956, Mr. Bill Hoover, representing KTEN, Ada, Okla., appeared before your committee. In Mr. Hoover's statement inference was made that KVSO-TV, Ardmore, Okla., would pay our company a service charge for the permission we have granted KVSO-TV to rebroadcast our transmission.

This inference is incorrect and without foundation of fact as are other references to WKY-TV made by Mr. Hoover as indicated in the report of proceedings.

WKY-TV will not receive directly or indirectly any financial return from the operation of KVSO-TV.

For the information of the committee we are furnishing herewith, as enclosures 1 and 2, copies of letters covering our authorization to KVSO-TV, and our permission to do so from the National Broadcasting Co. Copies of these letters were filed with the Federal Communications Commission on April 26, and May 4, 1956, respectively.

It is requested that this letter and enclosures be made a part of the record of the hearings before your committee.

Respectfully,

WKY RADIOPHONE CO.,
P. A. SUGG,
Executive Vice President.

ENCLOSURE 1

OKLAHOMA CITY, OKLA., *April 26, 1956.*

KVSO-TV,
Ardmore, Okla.

GENTLEMEN: This letter will confirm our conversation and understanding that until further notice to the contrary is given, KVSO-TV may rebroadcast the programs of WKY-TV, Oklahoma City. The permission granted herein is subject, of course, to KVSO-TV securing direct from the originating network specific authority to rebroadcast the programs of that network which are transmitted by WKY-TV. Insofar as the locally originated programs of WKY-TV are concerned, it is understood and agreed that KVSO-TV will receive no compensation whatsoever from WKY-TV for the rebroadcast of the programs in question, and that KVSO-TV will make independent arrangements with ASCAP and BMI for the payment of any and all royalties which may be due as a result of the programs rebroadcast by KVSO–TV and that your station will take all steps necessary to secure permission from the owners and distributors of film programs transmitted by WKY–TV prior to the rebroadcast by KVSO–TV.

It is further agreed that KVSO–TV shall pay all charges and fees that may be imposed by the owners of film and syndicated programs rebroadcast by your station and that KVSO–TV will hold WKY–TV harmless from any liability that may result from the actions of your station in the rebroadcast of programs originating over the facilities of WKY–TV.

It is requested you acknowledge receipt of this letter by signing the enclosed copy and returning it at your convenience.

Very truly yours,

WKY RADIOPHONE CO.,
By P. A. SUGG,
Executive Vice President.

Accepted this 26th day of April 1956.

KVSO–TV,
By JOHN EASLEY RIESEN,
Authorized Signature.

ENCLOSURE 2

NEW YORK, N. Y., *May 1, 1956.*

WKY RADIOPHONE CO.,
Oklahoma City, Okla.

GENTLEMEN: We hereby consent to your giving permission to the operators of station KVSO–TV, Ardmore, Okla., to pick up and rebroadcast over their television transmitter KVSO–TV such NBC television network programs broadcast by WKY–TV as we may from time to time designate.

The permission hereby granted may be revoked by us at any time upon notice to you of our intention to do so.

Very truly yours,

NATIONAL BROADCASTING CO., INC.,
By DONAL J. MERCER.

TELEVISION INQUIRY

TUESDAY, MAY 15, 1956

UNITED STATES SENATE,
COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE,
Washington, D. C.

The committee met, pursuant to notice, at 10 a. m., in room G-16, the Capitol, Senator Frederick G. Payne, presiding.

(The first two witnesses heard at this time, Wilbur M. Havens and Murray Carpenter, testified with respect to network practices and their testimony is therefore printed in the volume concerned with that subject.

(In the afternoon the committee heard Benedict Gimbel, Jr., and Henry B. Walker, Jr., testify with respect to allocations and related matters. Their testimony, together with certain other material in connection therewith, is therefore printed at this point.)

AFTERNOON SESSION

(The committee reconvened at 2:30 p. m., Senator John O. Pastore, presiding.)

Senator PASTORE. You may proceed, Mr. Gimbel.

STATEMENT OF BENEDICT GIMBEL, JR., PRESIDENT, PHILADELPHIA BROADCASTING CO. LICENSEE WIP, WIP-FM

Mr. GIMBEL. My name is Benedict Gimbel, Jr., and I am president of the Philadelphia Broadcasting Co., licensee of WIP and WIP-FM, of which I am the general manager.

Mr. Chairman, I deeply appreciate the courtesy extended to me by your committee to appear before you this afternoon and furnish information concerning the establishment of a new VHF channel for the United States. Let me preface my remarks by stating that the Radio station WIP, operated by the Pennsylvania Broadcasting Co., of which I am president, has filed comments with the Federal Communications Commission concerning this particular matter in docket 11532.

I also want to state that I am not an electronics expert. I have been in this business of broadcasting for almost 30 years, and it is still all mystifying to me. I listen to my radio, and I still don't understand it—I don't understand how these things are possible. I watch television, and now I watch color television, and it is all magic. I don't believe it is possible, but it is there, and it is happening. I want you to know that I am not a technical man; I am completely untechnical in my approach to this thing.

First, I would like you to know that the interest of WIP in television is not purely academic. As far back as November 1944, we filed the first TV application in Philadelphia. In 1946 the FCC designated four VHF channels for Philadelphia. In 1948 we went through a competitive hearing for a television station. Before a decision was handed down, the TV freeze was imposed, and when it was lifted some 4 years later, by the FCC's Sixth Report, we found to our dismay that the fourth VHF channel, for which we had gone through hearing, had been removed from Philadelphia and reassigned elsewhere.

As you know, the sixth report also established UHF. We immediately applied for and secured a UHF grant. However, after obtaining options on property and ordering equipment, it became apparent before building could commence that it would cost the people of Philadelphia at least $50 million to convert their sets to tune in our UHF station because there were almost a million VHF sets already in the area, none of them equipped to receive UHF. This being the case, an advertiser would hardly be expected to buy time on a UHF station to present his commercial messages if there was no audience.

Now, I think the committee should know there are three UHF grants outstanding in Philadelphia right now. None have been constructed—as a matter of fact, as far as I know, no construction of any nature has taken place, although one of these construction permits has been outstanding for almost 4 years. It is evident that these UHF permitholders are just as conscious of the dangers involved in operating a UHF station in an established VHF market as we were when we surrendered our UHF permit in 1954.

Even after we surrendered our UHF permit we persisted in our efforts to secure additional TV service for Philadelphia. We made a thorough search of all possibilities and the result is the 6–A plan which we are presenting to you this afternoon.

Your committee, I know, is well aware of the problems that beset television broadcasting in the United States. You have heard a number of persons and organizations tell of the various ills and any reiteration of these ills by me at this time would be an obvious waste of your time. Let me say, too, the FCC is well aware of these problems. As a matter of fact, this 6–A plan of my company was submitted in answer to a request by the Commission for suggestions to alleviate the present television allocation situation which if unchanged will prevent a truly competitive nationwide television service.

Something must be done about this—and immediately. Let me also state that the solution will not be a simple one. This committee, the FCC—in fact, no one can present an easy solution to these problems. I don't think there is a panacea. The plan which I propose to discuss in my testimony, let me admit quite freely, is not a complete solution. But it is a very necessary and quick step in the right direction.

It is now evident that 12 VHF channels are completely inadequate for nationwide service. An additional VHF channel—channel 6–A—will provide definite relief. Why? Because:

1. It will result in 54 additional VHF stations nationally.
2. It can be done almost immediately.
3. It can be tuned in on most present sets.
4. It will add an additional program service for 30 million people.
5. It will add a first VHF service to 17 cities.

6. It will add a second VHF service to 17 more cities.
7. It will add a third or more VHF service to 20 additional cities.
8. It will provide opportunity for increased network competition in these cities.
9. It is clearly within the jurisdiction of the Federal Communications Commission.
10. It requires no negotiation with, or permission from, any other Government agency.
11. It presents no obstacle to any plan presently before the FCC.
12. It causes minimum dislocation to existing TV stations.
13. It will provide an additional TV station for such major cities and trouble areas, as: Little Rock; San Diego; Miami; Chicago; Ames, Iowa; Great Bend, Kans.; Louisville; Bangor, Maine; Bay City, Mich.; Minneapolis-St. Paul; Kansas City; St. Louis; Rochester; Oklahoma City; Philadelphia; Amarillo; Dallas; San Antonio; Charleston, W. Va.; Utica-Rome, N. Y.—I sound like a train caller. [Laughter.]

Senator PASTORE. Let me ask you a question. You say you are not a technician. What would be the technical aspects of this channel that you are talking about?

Mr. GIMBEL. I am coming to that, sir.

Senator PASTORE. You are going to discuss the technical aspects of it, too?

Mr. GIMBEL. Yes, sir.

Senator PASTORE. All right. Then you are a technician?

Mr. GIMBEL. Well, when you see this, you won't think I am a technician. (Continuing.) The plan calls for a VHF station in Philadelphia as well as a VHF station for 34 other important cities.

It will, moreover, augment a number of meritorious plans which at this moment are receiving consideration by the FCC. We are convinced that in these plans the Commission has before it information which, when combined with the 6–A plan, will go far to supply the needs of the public with adequate nationwide service.

Perhaps the real dilemma of the problems besetting television can best be illustrated by considering the situation in Philadelphia. The Commission originally assigned to New York, only 90 miles away, 7 out of the total 12 television channels This automatically caused underallocation of VHF stations in many cities along the eastern seaboard of the United States.

For example, Philadelphia—with a population of 4½ million people—wound up with only 3 VHF channels. Compare this to Washington, the Nation's Capital, a city approximately one-third the size of Philadelphia, which has 4 VHF channels. I have no thought of condemning the allocation of four VHF channels to Washington. I mention it only to point up the disparity which exists in Philadelphia because of its proximity to New York. The result has been to deny to the people of Philadelphia sufficient television service to fill their needs. By reason of this underallocation, television time in the Philadelphia area is at a premium, so that it becomes increasingly more difficult for meritorious local programs to find good air time.

As an example, the night baseball games of the Philadelphia "Phillies"—of great interest to the people of Philadelphia—can find their way to the homes of Philadelphia viewers only through a Wilmington, Del., station—this is "secondary" reception at best. The three Philadelphia stations have network commitments which preclude their presenting the night baseball games.

Of necessity the Philadelphia advertiser has the same problem, and due to the limited television facilities available, he must compete for time against the huge budget of the national advertiser. The peak viewing hours on Philadelphia television stations are now occupied by either network commitments or by package programs purchased primarily by national advertisers. Obviously, a fourth VHF television channel, adding over 100 hours of programs weekly, would provide air time for many additional local programs. I am sure that this is true of all the major markets I have named.

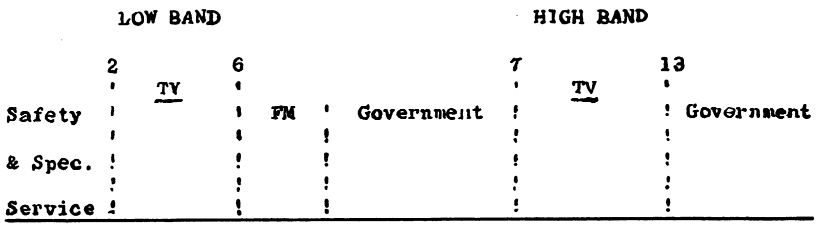
6–A is not an ingenious plan. As a matter of fact, the plan is so simple you might question why consideration has not been given to this before.

Gentlemen, it must be evident to everyone concerned with the problem that the major markets of this country are already saturated with VHF rceivers which are not readily adaptable to UHF because UHF needs a separate antenna and a separate tuning mechanism.

The only ready solution, then, to providing the public in these markets with more television service, is to take advantage of existing sets—and since almost 100 percent of all television sets in these markets will tune only VHF, it is only logical that this additional service has to come from the VHF channels themselves, or an adjacency to them.

Now here comes the technical part. This chart, I think, will demonstrate the simplicity of the 6–A plan.

POSITION OF VHF TELEVISION CHANNELS IN SPECTRUM



On this exhibit you will note the low band TV, channels 2 through 6, and the high band, 7 through 13. Any channel to be added, which could be tuned on present receivers, had to lie adjacent to these bands. Now directly above channel 13 and below channel 7 are Government frequencies which are untouchable because of national-defense requirements. Immediately below channel 2 are safety and special services, which are also unavailable. This leaves only the space immediately above channel 6, which is presently occupied by FM.

Now, our particular interest in finding space immediately adjacent to existing television channels was because we believed that the tuning range of many existing sets would permit tuning a given channel to either the next higher or next lower channel. In other words, if your set were turned to the channel 6 position, and channel 6 position had sufficient tuning range, it could be adjusted to receive channel 6–A. Experimentally we found this was true. We enlisted the aid of RCA, Philco, and two of the largest service organizations in Philadelphia.

We now have conclusive evidence that about 63 percent of all sets now in use will readily permit tuning of the channel 6 position to 6–A. If one well-known make of set is excluded, the percentage of sets tunable to 6–A rises to 93 percent. This means that no converters—no adaptors, no trick antennas—will be required to receive 6–A on most existing sets.

Mr. Cox. Does it require an adjustment in the set?

Mr. GIMBEL. Yes; it does.

Mr. Cox. What is the nature of that, the extent of it, or the cost?

Mr. GIMBEL. The cost—a service call and the possibility of the cost of a strip. That is not always the case, however.

Mr. Cox. That would depend on the individual set?

Mr. GIMBEL. That is right, sir.

Mr. Cox. And a single service call would be enough, with the possible addition of a strip, to permit the substitution of 6–A for 6 on the existing dial of the set?

Mr. GIMBEL. That is right; yes, sir.

Senator PASTORE. Let me ask you another question. Would this be of concern only to those localities where they presently have channel 6?

Mr. GIMBEL. I don't quite understand that question.

Senator PASTORE. Well, there is your chart there. Must you be adjacent to 6 in order to have 6–A?

Mr. GIMBEL. Oh, no. I will develop that a little later.

Senator PASTORE. I would like to have it developed now, if you don't mind, sir. I was reading your train stops here. Why did you leave out Providence, R. I.?

Mr. GIMBEL. It doesn't fit in there.

Senator PASTORE. Well, why doesn't it fit in there; that is the point I am getting at.

Mr. GIMBEL. I believe that under the FCC rules——

Senator PASTORE. In Rhode Island we have channels 10 and 12. Why can't we have 6–A, too?

Mr. GIMBEL. I believe because of mileage separation.

Senator PASTORE. Mileage separation from what?

Mr. GIMBEL. To existing channels—Boston is one. I will have to ask an engineer.

Senator PASTORE. Well, that is the reason why I ask that question about engineering. Is there someone competent to answer that question here?

Mr. STEEL. Yes, sir. I am David Steel. It is because of the mileage separation requirements of FCC rules. If some reduced mileage separations were tolerated, it would be possible to use that station at Providence.

Mr. Cox. You could not put it in any market in which there is an existing channel 6 without deleting that channel?

Mr. GIMBEL. Changing to another channel, yes.

Mr. Cox. Could you say you propose to use that spot on the dial for another purpose?

Mr. GIMBEL. That is correct.

Mr. Cox. As I understand it, your proposal contemplates the shifting of channel 6 for channel 5 in a number of instances?

Mr. GIMBEL. That is correct.

Mr. STEEL. It could be used in any town where channel 5 was allocated.

Senator PASTORE. Have you presented this to the Commission?

Mr. GIMBEL. Oh, yes; this is on file.

Senator PASTORE. Have you had any reaction?

Mr. GIMBEL. No, sir; nobody has had any reaction, that I know of, sir, because I believe that there are some 250 proposals in answer to these comments at the Commission presently, and I haven't heard of any reaction to any of them.

Senator PASTORE. Has there been any remonstrance on the part of FM people in the area that would be affected?

Mr. GIMBEL. No.

Mr. COX. Has there, however, been considerable evidence that even a comparatively minor expenditure—in the neighborhood of $5 to $10, which I think you suggest as the maximum charge of this adjustment—is enough to discourage a substantial part of the public from making that change as long as there is any other service available?

Mr. GIMBEL. I don't know that there has been that experience.

Mr. COX. In other words, you would have this situation if you dropped channel 6–A into Philadelphia: The people who have asked to spend $5 to $10 to get this new channel already have available to them the programing of the three national networks through the local Philadelphia stations and they have an independent station at Wilmington that they can receive?

Mr. GIMBEL. Yes.

Mr. COX. Now, isn't there great danger that at least several hundred thousand of them are not going to be willing to spend even $10?

Mr. GIMBEL. That I think is correct. That is a calculated risk.

Mr. COX. This is a risk that anybody applying for such a channel would have to take?

Mr. GIMBEL. That is correct, because as I pointed out earlier, there are programs that are unable to come into Philadelphia and get satisfactory service. The baseball games, for one—I think many people are willing to pay six bucks to see even the Phillies. That is one of the problems, and that is a risk we have to take, but I feel sure that a lot of people wouldn't pay that.

Senator PASTORE. Well, there is no imposition upon the viewer—this is something in addition to what he already has, and if he is willing to receive this new opportunity of a channel, then of course he can undergo this expense you are talking about?

Mr. GIMBEL. That is right.

Senator PASTORE. It isn't injuring him in any way?

Mr. GIMBEL. It isn't, no. It is like a person using a toll road. He doesn't have to use the toll road, he can get to where he is going without paying the additional 50 cents; but it is sometimes better and you get more service—you get more program service if you get another channel.

One problem remained. If we used 6 megacycles taken from the FM band, what would we do with the FM stations displaced? Our consulting radio engineers were directed to explore this problem. They found that all existing FM stations could easily be accommodated in the remaining portion of the FM band, requiring no more than replacing the crystal and retuning the transmitter. In addition, room for expansion still would exist in the FM band. In our comments to the FCC we supplied a table showing where each FM station affected could be reassigned. It is therefore obvious that channel 6–A can be utilized right now without deleting any FM station.

Mr. Cox. Are these changes you propose only necessary in the transmitter? Could you continue to receive all of these adjustments without any change in the sets?

Mr. GIMBEL. In the sets themselves, yes; there is no change required in the set at all.

Mr. Cox. All that you are doing is shifting these stations about within the existing allocations to the FM service?

Mr. GIMBEL. Except possibly in such a service as storecasting, there might be a change.

Mr. Cox. Isn't it true that 4 of the 6 megacycles are permanently reserved to FM educational service?

Mr. GIMBEL. Yes.

Mr. Cox. Now, is it your position that those can also adequately be taken care of?

Mr. GIMBEL. Yes, adequately, and we have provided such a plan. It is on file right now with the Commission, with our comments.

The committee should be reminded here that the channel 6–A plan is entirely within the jurisdiction of the FCC without negotiation with, or permission from, any other Government agency.

I do not want this committee to get the impression that there are no problems which will result from the adoption of this plan. Any solution is bound to raise some problems. In fact, every plan pending before the FCC presents some difficulties. However, we believe the 6–A plan problems are minor.

We have told you some FM stations would require relocating within the present FM band. This could be done with small expense. Although one television station in Richmond, Va., one in Johnstown, Pa., and one in Plattsburg, N. Y., will be required to shift to channel 6–A, this problem simply resolves itself into the arithmetical consideration of 3 markets as opposed to 54. In balancing the equities there can be no doubt that service to 54 markets with 30 million people is paramount to the temporary inconvenience, in 3 markets, of 1,200,000 people.

Mr. Cox. However, in those instances you would not be providing channel 6–A as an additional service—you would provide it as a substitute for existing service?

Mr. GIMBEL. That is correct.

Mr. Cox. And you would, therefore, require all the viewers in Richmond and the other two markets you have named to make this minor expense to continue to receive the same service they presently have?

Mr. GIMBEL. That is right, but some of them could get it. I think by and large it would require some readjustment, yes, sir.

Senator PASTORE. Sir, the thing that is disturbing me at this point—I don't know whether it is really a disturbance—you say here you were invited by the committee to appear here to make this presentation.

Mr. GIMBEL. Yes, sir.

Senator PASTORE. Who invited you?

Mr. GIMBEL. I was told by our attorneys we were invited.

Mr. Cox. They asked to be heard and then we communicated with them.

Senator PASTORE. I don't mind hearing this, but wherein do you think this matter that you are bringing up falls within the jurisdiction or the province of the Congress? Isn't this a matter to be decided by the FCC?

Mr. GIMBEL. It is in the hands of the FCC presently.

Senator PASTORE. That is why I asked you whether or not there was a response to the presentation that you made. You wouldn't expect us to introduce a law here to allow 6–A, would you?

Mr. GIMBEL. I feel this way about it, Senator. This is so important that I want to take every opportunity to express this plan—any forum I can—to express this plan to expedite its development. Now, the FCC has got lots of plans. We think this is a very good one.

Senator PASTORE. Yes, but you have explored it with the proper agency of the Government that has jurisdiction to determine it, and I am asking you, in what respect do you think that we can guide this on 6–A? You are familiar with the function of the Congress?

Mr. GIMBEL. Well, I feel this way——

Senator PASTORE. You feel if you say it twice, it is going to be stronger?

Mr. GIMBEL. Possibly.

Senator PASTORE. Well, all right, then, say it.

Mr. GIMBEL. In four other markets—namely New York, Washington, D. C., Schenectady, and Philadelphia—the station assigned to channel 6 must move to channel 5 and the station presently on 5 to 6. Again, this can be accomplished at inconsequential expense. It could be done overnight and the following morning the public would simply tune to channel 5 instead of 6, and vice versa.

For a moment, let me touch on the receiver questions with respect to channel 6–A. We have determined, through our own resources and with expert advice, that most existing receivers can be readily tuned to the new channel. The remainder will require minor modifications. However, it should be borne in mind that every new television set now on the production line could readily include provision for channel 6–A as soon as the plan was adopted.

You should be mindful of the following statements of the Chairman of the FCC, Mr. McConnaughey, and I quote:

> * * * there are not enough competitive facilities in the largest centers to completely serve the needs of the public or of advertisers. * * * we cannot delay consideration of *every constructive suggestion* for making available at the earliest possible date, competitive assignments in those communities where the economic potential already exists and where entrepreneurs are ready, willing, and able to build new stations. [Emphasis supplied.]

We are mindful of the FCC's desire to provide a nationwide, competitive television broadcast service, and are further mindful that the Commission has been beseiged with plans requiring wholesale reallocation and widespread receiver conversion or replacement.

Before permitting such disruption to the television industry and the public, it would seem more logical to put into operation a plan for securing additional VHF television service in that area of the spectrum which is readily adaptable to present day receivers. Furthermore, space for 6–A would be taken from that portion of the spectrum which is not now fully utilized. Therefore, in line with the philosophy of the Commission and its Chairman, we have submitted this morning to the FCC a petition asking that immediate rulemaking proceedings be instituted to incorporate channel 6–A as part of the television broadcast service.

In conclusion, let me emphasize that it seems a crime to waste such valuable potential VHF channel space, so readily available. This committee and the FCC have indicated that they want an immediate and practical solution to this problem. We are convinced, from all indications both of this committee and of the Commission, that the solution reached this time will be final and permanent.

Summarizing quickly, the 6–A plan should be adopted by the FCC because:

1. It supplies additional VHF service to 54 markets totaling 30 million people throughout the Nation.

2. Most receivers will tune readily to the new 6–A channel. The remainder will require minor modification.

3. The 6–A plan conforms to all present standards including mileage separations.

4. It increases competition by providing additional outlets for network service.

5. It increases competition between stations, which results in better programs.

6. The 6–A plan is entirely within the jurisdiction and rulemaking power of the Federal Communications Commission.

We feel that this is the last trip to the well. If this plan is not adopted, we are convinced that the city of Philadelphia as well as other major markets will be forever deprived of adequate television service.

Let me say again, that I appreciate sincrely the opportunity to appear before this committee. If there are any questions the committee would like to ask of me, I'll do the best I can to give you an answer.

Senator PASTORE. Well, let me say to you, Mr. Gimbel, that you make a rather persuasive argument. Of course I am not competent or qualified to determine the technical aspects of it. Your advisers agree with you that this can be done technically.

The matter has been submitted to the FCC. They have the facilities, they have the technicians, and they have the rulemaking power to give this the consideration that it deserves. I feel—and of course this is where the Congress comes in—that if this is a plan that doesn't disturb any existing facility, but adds thereto and means more service, better service to the people of Philadelphia and other parts of the country, they ought to adopt it, or ought to at least give it serious consideration.

Mr. GIMBEL. Thank you, sir.

Senator PASTORE. Thank you very much for appearing before us.

(COMMITTEE NOTE: Leonard H. Marks, general counsel for the FM Broadcasters, appeared before the committee on June 11, 1956, to testify in reply to Mr. Gimbel. He requested that his testimony appear following that of Mr. Gimbel, so it is printed at this point, together with a letter dated June 12, 1956, correcting one point in his testimony. (This last was inserted in the record on July 17, 1956, see page 935 below.))

(There is also printed in connection with Mr. Gimbel's testimony a letter dated May 22, 1956, from Morton H. Wilner, counsel for Triangle Publications, Inc., with reference to Mr. Gimbel's proposal. (This letter was inserted in the record on June 11, 1956.))

(After the insertions, the record resumes with the testimony of Henry B. Walker, Jr., at p. 912.)

STATEMENT OF LEONARD H. MARKS, GENERAL COUNSEL, FM BROADCASTERS

Mr. Marks. Thank you. Before I begin my statement, I would like to ask that my testimony appear following the testimony of Benedict Gimbel of Philadelphia, Pa., who appeared recently before this committee and made suggestions which I oppose. I have written a letter to the committee clerk to that effect.

Senator Ervin. That request will be granted, if it is technically possible.

Mr. Marks. Thank you, Senator.

I have a prepared statement which I have made available to the stenographer and I would prefer to speak at this time extemporaneously and give you the gist of our contentions.

I am Leonard H. Marks and I am an attorney with offices at the Cafritz Building, in Washington, D. C. As you have noted, I appear today as general counsel of the FM Broadcasters, a trade organization which was recently organized for the purpose of educating the public on the benefits of FM broadcasting and of protecting the interests of those engaged in FM broadcasting from those who would like to acquire the spectrum space which it has assigned to it.

Now Mr. Gimbel, who testified before this committee recently, has a radio station in Philadelphia, Pa., and desires to engage in television broadcasting. He does not believe that the UHF opportunities in that community would permit him to operate a station successfully, so therefore he has recommended that a new channel be carved out of the spectrum to be known as channel 6–A and that this be made available to those who would like to apply for television broadcasting in certain communities throughout the United States.

Now, in order to get channel 6–A, Mr. Gimbel recommends that six megacycles be taken from the FM band and that the FM stations who might be operating in those frequencies be put elsewhere. He recognizes in his statement that the suggestion is a serious one, that it will cause a certain amount of dislocation, but with true self-interest, Mr. Gimbel feels that it is better to accommodate people like himself who want television channels than to allow FM broadcasting to continue.

Needless to say, we vigorously oppose any such recommendation. Now, I would like to tell you a little bit about the problems of FM, as they have existed for the past 15 years, in order that you might appreciate how serious this suggestion would be. First, let me point out that at the present time there are approximately 550 stations operating commercially on FM. In the State of North Carolina, for example, you may have a personal acquaintance with the fact that no reliable service is available at night on AM broadcasting and that the bulk of the service is rendered through FM. This is true throughout many States in the United States. In addition, there are 125 stations that operate noncommercially and are licensed to schools and nonprofit organizations engaged in educational work. There are 250 manufacturers engaged in the manufacture of hi-fi FM equipment.

Now, FM was the invention of Maj. Edwin H. Armstrong, who has been recognized as one of the truly great American inventors. He was an electronic genius, and when he discovered FM, those in the broadcasting industry recognized—this was about 1939—that at long last here was a solution to the atmospheric interference problems and the other problems of engineering which had beset the radio industry; and so those who were the leaders of the field applied for and received permission to build FM stations. Well, about 50 stations were built and then Pearl Harbor came along. During the time that we were engaged in war, it was not possible to manufacture civilian FM receivers. It was not possible to take the production of the electronic manufacturers and use them for new FM stations, so the 50 stations limped along with a minimum schedule. The public that had sets enjoyed whatever programs were available, but they could not increase the audience.

Now that was fine, as far as it went, until 1945. We all recognized it was necessary for the war effort. In 1945 the FCC started an allocation hearing and they had to find a place for commercial television, and so the engineers had various committees and the industry contributed the best of its thinking. The industry recommended that FM be kept where it was on the 42- to 50-megacycle band, and that television be placed in what is now the UHF. The industry pointed out that FM would not function as satisfactorily in the UHF band, or the 88- to 108-megacycle band, which is now assigned. Major Armstrong, the inventor, and all of the prominent scientists, so testified, but the Commission said "No, we want television to begin to operate where FM now is, and so we are going to move FM," and that was done.

The 50 stations that had been built had to change their equipment to move to new frequencies. Everybody that had an FM set had to scrap it and start all over again. Now, despite that, FM managed to grow so that at the present time there are more than 500 commercial stations operating. Unfortunately, FM stations have not been as prosperous as those engaged in AM broadcasting, or certainly those engaged in television broadcasting, but the public has learned to recognize the importance of this service and has maintained it commercially in those markets where FM stations have been able to operate on a full-time basis. At the present time, at the very minimum, there are 12 million FM sets, having an original cost in excess of $500 million. Now, Mr. Gimbel's suggestion is that we take 6 magacycles from this band and give it to television and those stations that might be operating in those 6 megacycles will then either be deleted—there will be no service at all—or that they be changed to new assignments.

Now, if they are changed to new assignments, this means getting new transmitting equipment. It means reeducating the public as to where these programs will be found on the dial. In addition to that, some of these FM stations have been able to derive additional revenue by operating specialized services. Two of the more prominent specialized services are functional music or background music and the other is store broadcasting. Functional music is a background music service where receivers are installed in stores, factories, and offices, and all day long appropriate background music is presented and they pay a fee for the privilege of having this type of service.

The same thing is true in stores like grocery chains, where announcements are made of the products available in the grocery chains. This has been authorized by the FCC and this is a means that FM stations have used to supplement meager revenues and enable them to operate in the black. In order to operate that system, you have to have special receivers in every factory, office, or store that will be tuned to this particular channel. Now, if Mr. Gimbel's suggestion is adopted, those receivers are practically obsolete. The cost of converting them would be almost as great as replacing them with new receivers. Now, we are talking about an industry which has struggled from 1939 to the present time to achieve its proper place in the broadcasting world, an industry that has had more than its usual share of problems—first the war and second the problems created by the FCC's allocation to take care of television.

Mr. Gimbel's suggestion will satisfy the selfish needs, perhaps, in 54 markets of the United States. He recognizes, although he does not tell you, that there will be a number of FM stations that will suffer as a result. Presumably he recognizes that the public will be deprived of FM service in these localities.

In addition to that, three existing television stations located in Richmond, Va., Johnstown, Pa., and Plattsburg, N. Y., will have to give up their present operating assignments in order to accommodate Mr. Gimbel's plan. Now this committee is interested in a solution to the UHF problem, and certainly our organization and anybody in the broadcasting industry wants a solution to the UHF problem; but the Gimbel plan will not solve the UHF problem. It will create an FM problem. The UHF problem is nationwide. It cannot be solved by the addition of one channel. The FCC Commissioners have said that, and every important person in the engineering or broadcasting field that has studied the problem recognizes it; and I don't believe that it would be in the public interest, to the detriment of the FM industry, to try to carve out a new channel that will at best satisfy the limited needs in a few markets.

Let me also point out that channel 6–A will bring with it all of the problems of conversion that UHF has. Mr. Gimbel says they will not be as great as the existing conversion problems, but when you have channel 6–A, every receiver will have to have a tuning strip installed—every person that has a set will have to go to the additional expense of adapting it—so we don't think that that solution is going to be an answer to the UHF problem. And what is far more important to us, the FM industry cannot stand another dislocation such as was caused in 1945, when FM was moved from 42 megacycles to 88 megacycles.

For these reasons, we oppose Mr. Gimbel's suggestion.

Mr. Cox. Can you tell us, Mr. Marks, approximately how many of the FM stations in existence would be in the particular 6 megacycle section that he is concerned with?

Mr. Marks. Mr. Gimbel has not furnished an engineering plan. He merely mentions 54 markets where channel 6–A might be assigned. There would be a chain reaction when you move stations, and I would not know how many FM stations or cities would be involved. There is no way of knowing without seeing Mr. Gimbel's engineering.

Mr. Cox. As I recall it, he had attached to his comments to the Commission an engineering study which showed the reallocations that would be made in the FM band, as far as television was concerned.

Mr. Marks. I am not aware of that, Mr. Cox. I knew that he had referred to three television stations and their new assignments, but I do not recall any FM reallocation.

Mr. Cox. There was some reference, I believe, in his testimony to educational FM stations. Perhaps those were the ones for which he was making some special provision in terms of his engineer's conclusions.

Mr. Marks. That is possible, but I do not recall any engineering on commercial FM.

Mr. Cox. This represents a third of the FM space; is that correct?

Mr. Marks. Yes, 88 to 108 is the present band, and this would be a little less than one-third.

Mr. Cox. Are the stations pretty evenly distributed throughout the spectrum?

Mr. Marks. Yes, and in the large markets such as in the East you cannot find an FM channel, they are all taken; so if you took away 6 megacycles, you would have a serious dislocation and some stations would have to be deleted.

Senator Ervin. The thing that has impressed me above all else in these hearings is that every remedy illustrates the old adage that "One man's meat is another man's poison." I wish somebody would come up with a remedy that would solve all of these problems that confront this committee about this matter and not dislocate anybody.

Mr. Marks. That would be ideal, and of course the suggestion has been made that UHF be developed. That would not take away anything from anybody. It might be a slower process, but it would be one way of answering it.

Senator Ervin. Well, we are certainly indebted to you for the very clear exposition of your views in respect of this matter.

Mr. Marks. Thank you, indeed, Senator.

(The statement of Mr. Marks, also his letter and Wilner's letter are as follows:)

Statement of Leonard H. Marks, General Counsel, FM Broadcasters

My name is Leonard H. Marks, and I am an attorney, with offices at the Cafritz Building, Washington, D. C. I appear today as general counsel of FM Broadcasters, a group which has recently been organized for the purpose of educating the public on the benefits of FM broadcasting, and of protecting the interests of those engaged in this field from encroachment by those who covet the spectrum space assigned for FM.

You recently heard testimony from Mr. Benedict Gimbel, Jr., of Station WIP, Philadelphia, Pa., in which the suggestion was made that 6 megacycles be deleted from the existing FM band in order to provide a new television channel, channel 6–A. This suggestion has been made as a solution to the serious problems which now confront those engaged in UHF broadcasting. We vigorously oppose this recommendation and submit that instead of solving the UHF problem, this suggested change would create a new FM problem.

In order that you may appreciate the serious dislocation that would result from Mr. Gimbel's suggestion, I would like to give you a brief history of FM broadcasting.

1. After a period of intensive and painstaking electronic research, the late Maj. Edwin H. Armstrong, one of America's truly great electronic inventors, developed the art of FM broadcasting. Those who were engaged in the broadcasting field recognized Major Armstrong's invention as the event which could herald a new day for radio reception. Through the medium of FM, a new and

improved service could be presented to the whole country; static-free service would be made available to the many areas which have for long suffered from atmospheric and other interference problems. Musical programs could now be presented via FM with high fidelity never possible on the standard broadcast band. In fact, for the first time, music lovers would be able to hear symphonic and other musical presentations with the same clarity of tone achieved in the music hall. That is what Major Armstrong's invention was capable of performing.

Based upon Major Armstrong's recommendation, the Commission assigned the 42–50 megacycle band for this new and improved service. Pioneer broadcasters then proceeded to invest large sums of money to build FM stations throughout the country.

2. Before the FM industry could really get started, the war intervened in 1941, and the approximately 50 stations which had been built at that time maintained a minimum schedule. It was difficult to expand FM service since military requirements prevented the manufacture of transmitters for civilian use; receiver manufacturers were unable to make FM receivers for civilian consumption. Accordingly, during the war years FM did not and could not progress.

3. At the end of the war the Commission reexamined the allocation of frequencies and determined that the FM band must be moved from the 42–50 megacycle location to the present 88–108 megacycle band. This move was made necessary in order to accommodate the needs of commercial television.

4. It is significant to note that in the allocation hearing before the FCC, Major Armstrong and other industry engineers vigorously opposed any such move and pointed out that the dislocation would seriously hamper the development of FM broadcasting. Moreover, with great prophetic vision they predicted that television could not be accommodated in the limited spectrum space that was contemplated and that the natural home of television was in the UHF band. Nevertheless, the Commission determined that the 50 existing FM stations must be moved to the new band, not to help FM, but other services in need of spectrum space.

5. As a result of this change in the allocation table, the thousands who had purchased FM receivers found that their sets were obsolete, and these FM stations had to purchase new transmitting equipment in order to comply with the Commission's requirements. This conversion process not only involved the expenditure of substantial sums of money by broadcasters, but it also required extensive retooling by the manufacturers of FM receivers. Moreover, as predicted by Major Armstrong and others, this conversion process was a difficult, as well as a costly, experience. As a result, FM was set back for years.

6. Despite these obstacles, the FM industry advanced so that today there are in existence approximately 550 commercial FM stations and an additional 125 noncommercial, educational stations. At the very minimum, there are 12 million FM receivers capable of receiving FM programs on the new band. These receivers have an original cost evaluation of approximately $500 million. The members of this committee can call on their own experience in listening to FM programs here in Washington, D. C., but I thought that you might be interested in a survey made by Pulse, Inc., during the week of April 1 to 7, 1955, to show the extent to which FM has gained wide public acceptance. In the Washington area there are 475,000 radio homes, and the survey disclosed that 39.1 percent of those homes had FM sets. This means that there are in the Washington area 190,000 sets equipped for FM listening.

The survey showed that 62.9 percent, or approximately two-thirds of these families, used their FM set during the preceding week of the study, and that the number of hours which they listened was comparable to AM as follows:

32.5 percent listened less than 1 hour
19.7 percent listened for 1 hour
23 percent listened for 2 hours
4.7 percent listened for 3 hours
7.7 percent listened for 4 hours
3.3 percent listened for 5 hours
2.3 percent listened for 6 hours
2.8 percent listened for 7 or more hours

The listening audience embraced primarily families with a higher income level than average, as follows:

33 percent were in the upper quarter;
35 percent were in the second quarter;
24 percent were in the third quarter; and
Only 8 percent were in the low end of the scale.

7. The public, having been exposed to the superior qualities of FM broadcasting, has learned to appreciate the advantages which it affords and has responded by supporting these stations generously with great appreciation for the program service being presented. As a result, the FM industry presents today, for the first time, a picture of health and growth; there is a stability which had not been possible before because of the various incidents which I have related.

8. Some FM stations entered into allied fields by providing a general background music service or a store-cast service to chainstores in their area. These services are provided through a system of multiplex transmission so that the public receives a general program service consisting of news, religious programs, educational features, public service interviews, as well as entertainment. In addition, simultaneously, through the use of certain engineering devices or multiplex, it is possible to present a background music service to individual subscribers, or a store-cast service, in particular stores. These specialized services have enabled FM stations to realize sufficient additional income to permit a successful commercial operation.

Now that you have heard the background of the development of the FM industry, I want to point out to you how Mr. Gimbel's suggestion would affect it. If 6 megacycles are taken from the existing commercial FM band throughout the United States, the following will result:

1. Some FM statitons would have to be deleted or changed to radically inferior frequency assignments;
2. The public would be deprived of some FM service where a station was deleted;
3. All affected FM stations would have to change frequencies and make the necessary equipment modifications;
4. Those FM stations engaged in specialized service, such as background music and store-casting, would be required to convert the receivers which were preset, or to replace them with new equipment;
5. Three existing television stations would be required to change their frequency to channel 6–A; and
6. Persons residing within the coverage of these three stations would be deprived of their existing service unless they adapted their receivers for the use of channel 6–A.

Mr. Gimbel recognized the seriousness of this problem when he stated in his testimony:

"I do not want this committee to get the impression that there are no problems which will result from the adoption of this plan. Any solution is bound to raise some problems. In fact, every plan pending before the FCC presents some difficulties. However, we believe the 6–A plan problems are minor.

"We have told you some FM stations would require relocating. This could be done with small expense. Although 1 television station in Richmond, Va., 1 in Johnstown, Pa., and 1 in Plattsburg, N. Y., will be required to shift to channel 6–A, this problem simply resolves itself to an arithmetical consideration of 3 markets as opposed to 54 markets."

To say the least, Mr. Gimbel has understated the nature of the problem. The disruption that would be caused to the public and the FM broadcasters would be major and, in some cases, catastrophic.

I am certain that this committee realizes that the addition of channel 6–A to the television band would not be a solution to all of television's ills. In fact, channel 6–A would bring with it the same problems of conversion that now exist with the UHF band. We would, in effect, be trading one type of conversion difficulty for another. We would not be solving the television problem; we would merely be creating a new FM problem.

When a comparison is made of the great benefits which the public now derives from FM broadcasting with the problematical service which could be afforded under the Gimbel plan, it becomes apparent that this suggestion leaves much to be desired.

Of course, this committee and the FCC are under great pressure to find a solution to the UHF problems. This country needs a nationwide competitive television service but it will not be sufficient via the Gimbel plan to provide for 54 markets, or any other small number, by dislocating a major part of a very substantial industry. For these reasons, I oppose the suggestions that have been made to add channel 6–A to the television band at the expense of the FM broadcasting industry.

(The following is a letter correcting Mr. Marks' testimony on one point. It was inserted in the record on July 17, 1956; see p. 935 below.)

COHN & MARKS,
Washington, D. C., June 12, 1956.

Senator WARREN G. MAGNUSON,
Senate Interstate and Foreign Commerce Committee,
United States Senate, Washington, D. C.
(Attention: Nick Zapple, clerk.)

DEAR SENATOR MAGNUSON: Since testifying before your committee on June 11, 1956, I have discovered that station WIP, Philadelphia, Pa., did submit an engineering study to the FCC in support of its plan to delete certain portions of the FM band in order that channel 6–A might be used.

I have checked this study and find that under the specific plan proposed, it would not be necessary to delete any FM stations, but that a number of channel changes would be required.

You are requested to associate this letter with the testimony which I have presented.

Very truly yours,

LEONARD H. MARKS.

(The following letter, relative to Mr. Gimbel's testimony, was inserted in the record on June 11, 1956.)

LYON, WILNER & BERGSON,
Washington, D. C., May 22, 1956.

Senator WARREN MAGNUSON,
Chairman, Interstate and Foreign Commerce Committee,
United States Senate, Washington, D. C.

DEAR SENATOR MAGNUSON: We are concerned at this time with the limited proposal submitted before your committee by the Pennsylvania Broadcasting Co. (WIP) recommending the creation of a new channel 6A. In this connection, your attention is respectfully directed to paragraph 3 of the attached comments submitted by Triangle Publications, Inc. (radio and television division) to the Federal Communications Commission in docket No. 11532, on February 8, 1956, which clearly establishes the impractical and wholly undesirable nature of the WIP proposal. As counsel for Triangle Publications, Inc., I have attached herewith a copy of these comments and respectfully request that said copy be incorporated, by reference, in the record of your present television hearing.

It is not my purpose to encumber the record, and accordingly I have not recommended that the document be inserted in the record proper. However, it is my belief that you and your staff at least should have Triangle's comments for ready reference.

Very sincerely yours,

MORTON H. WILNER.

(Returning to the proceedings on the afternoon of May 15, 1956, the following transpired:)

Senator PASTORE. Mr. Walker, how long will your statement take?

Mr. WALKER. I think about 15 minutes, sir.

I want to express my appreciation, Mr. Chairman, for being allowed to be here, today.

STATEMENT OF HENRY B. WALKER, JR., SECRETARY AND TREASURER OF ON THE AIR, INC., EVANSVILLE, IND.

Mr. WALKER. My name is Henry B. Walker, Jr. I am the secretary and treasurer of On the Air, Inc., of Evansville, Ind., which operates radio stations WGBF in Evansville and WTMV in East St. Louis, Ill. On the Air, Inc., also is affiliated with a company which operates radio station WBOW in Terre Haute, Ind.

My appearance here is authorized by my board of directors for two purposes: First, to advise this committee of a decision by the Federal

Communications Commission which is discriminatory and contrary to all policies as previously stated by the Commission to this committee and to the equivalent committee of the House; and second, to advise this committee briefly of the desparate economic plight of a large segment of the radio industry resulting from the shortsighted and unrealistic policies of the Federal Communications Commission.

When the television freeze was lifted by the FCC on April 14, 1952, 1 VHF channel (channel 7) and 3 UHF channels (channels 50, 56 and 62) were allocated to Evansville. Of these, channel 56 was reserved for educational use.

The two commercial UHF channels were granted without comparative hearings, and the successful applicants, Ohio Valley Television, Inc., for channel 50 (now WEHT–TV) and Premier Television, Inc., for channel 62 (now WFIE–TV), went on the air in September and November of 1953, respectively. Each of these companies is owned by the owners of a chain of movie theaters. These two companies which applied for UHF channels after the allocation of a VHF channel to Evansville and which received their grants without a contest have been among the leaders in the fight of the UHF stations for deintermixture.

Four applicants considered the VHF channel sufficiently superior to UHF to risk a fight for it: On the Air, Inc., which is sometimes referred to herein by its corporate name and sometimes by its call letters, WGBF; WFBM, Inc. (WEOA); South Central Broadcasting Corp. (WIKY); and Evansville Television, Inc., a new company formed for this purpose. To determine which of these applicants should receive the grant, the FCC set the applications for comparative hearing. The hearing began in May 1953, and continued intermittently until March 1954. During the course of the hearing, WIKY withdrew its application.

In October 1954, the FCC examiner released his initial decision favoring Evansville Television, Inc., on the basis that an applicant without any radio broadcasting interests should be favored over one which does have such interests. In his initial decision, the hearing examiner used this language:

> * * * were it not for the fact of ownership of other media we might very reasonably have preferred WGBF and it is perhaps unfortunate that the very facilities whose long and successful operation naturally lays claim to our approval should furnish the basis for our ultimate determination against WGBF.

An excerpt from the conclusions of this initial decision is attached hereto and designated "schedule A," appendix, page 1.

WGBF, WEOA and the Broadcast Bureau of the FCC filed exceptions to the initial decision, and briefs in support thereof, and asked for oral argument before the full Commission. As you know, the Broadcast Bureau is that part of the FCC charged with the responsibility of representing the interests of the general public by attempting to insure that the actions of the Commission are in conformity with the spirit as well as the letter of the Communications Act. The Broadcast Bureau referred in its exceptions and at oral argument to "the fine past record of performance" of WGBF and recommended that the grant be given to WGBF rather than Evansville Television, Inc. An excerpt from the brief and exceptions filed by the Chief of the Broadcast Bureau of the FCC in this case is attached hereto and designated "schedule B", appendix, page 3.

In an article entitled "Diversification: Its Case History" by Earl B. Abrams in Broadcasting-Telecasting, November 1, 1954, the examiner's decision in the Evansville case is characterized as "the reductio ad absurdium of the Commission's diversification policy."

Subsequent to the oral argument, the owners of WEOA sold their station and withdrew their application for channel 7. That left WGBF and Evansville Television as the only remaining contestants.

In February 1955, WFIE-TV and WEHT-TV, the two UHF stations allocated to Evansville, petitioned the FCC to institute rulemaking proceedings changing the channel allocations for Evansville by reserving channel 7 for noncommercial educational use and releasing channel 56 for commercial use. WGBF and Evansville Television filed oppositions and asked for oral argument, which was held in June 1955.

On December 27, 1955, the FCC denied the petitions of the UHF stations and granted channel 7 to Evansville Television, Inc. The final decision in favor of Evansville Television, Inc., differed somewhat from the examiner's initial decision. In addition to the factor of diversification of control of media of mass communication, the final decision also gave weight to what it declared to be the greater integration of ownership with management on the part of Evansville Television than it found in the WGBF case, and it discounted the past broadcast record of WGBF which the examiner and the FCC Broadcast Bureau had praised. The decision found that WGBF's proposed television programing plans were superior to those of Evansville Television, but that this factor was outweighed by the factors of integration of ownership with management and the diversification of control of media of mass communication.

On January 26, 1956, WGBF filed a petition with the FCC asking for reconsideration of its decision. Although no public announcement has as yet been made of any action on our petition, we have been advised that the Commission has voted to deny the petition for rehearing.

After such a decision, it might be expected that the District of Columbia Court of Appeals could be expected to reverse the FCC if the case was wrongly decided. But the record of appeals to that court shows that it has virtually given the Commission carte blanche in its power to choose between applicants, and the opinion of the legal fraternity here is almost unanimous that such appeals are virtually hopeless.

I wish that I might have the time to discuss in detail the merits of this decision. I realize that it would be an imposition to attempt to do so. However, I will presume to make one broad statement and I am willing to let the record substantiate it in any and every particular. Without using the principle of diversification of ownership of media of mass communication as a point against WGBF, the Commission could not possibly have rendered its decision against WGBF. Any point based solely on the merits of the case could not have been sustained, in my opinion, even in the court of appeals. Most of you are probably somewhat familiar with the various criteria which are used in evaluating applicants for broadcast or television facilities. These include such factors as local programing, past broadcast experience, local residence, civic participation, diversification of business interests as well as integration of ownership with management and diversification of control of media of mass communication.

The Commission conceded the superiority of WGBF as to the factor of local programing.

The Commission attempted to discount the fine past record of performance of WGBF which had been praised by the examiner and the Broadcast Bureau.

The Commission gave a preference to WGBF as to the factor of local residence because it had no alternative. It then unjustly attempted to discount the value of this preference by implying it was of little weight, although all of the officers and directors of On the Air are lifelong or longtime residents of Evansville and own more than 75 percent of the stock of the parent company; while only one officer or director or voting stockholder with 13.5 percent of the voting stock of Evansville Television has ever lived in Evansville.

As to the factors of civic participation and diversification of business interests, the Commission concluded that the applicants are equal. These conclusions and the findings on which they were based are flagrant examples of distortion and bias by the omission of relevant facts and the overemphasis of trivial ones. Rex Schepp and his wife, who own 55 percent of all the stock of Evansville Television, have no other business interests of any kind, and the Commission found only one civic activity in which either of them had participated during their entire lives. The next largest stockholder, having 13.5 percent of the voting stock and 16.1 percent of the nonvoting stock, is Dr. B. F. Schepp, a brother of Rex Schepp, who has no other business interest except the practice of optometry. The Commission devoted a great deal of space to describe his five civic activities which included his church, the Elks, the chamber of commerce, the Evansville Council of Clubs, and the National Society for the Prevention of Blindness. No more than one outside business interest was found for a single other voting stockholder and not even one single civic activity was listed for any of them. The Commission described in detail the business interests and civic activities of 6 stockholders owning nothing but nonvoting stock who were neither officers nor directors of the corporation nor were to be paid members of its staff, and 4 of whom owned only $1,000 of nonvoting stock apiece. As a matter of fact, the 6 together own only 5.2 percent of Evansville Television's total stock subscription. The entire case for Evansville Television on these points was based on these 5.2 percent nonvoting stockholders.

In applying these two factors to the officers and directors of On the Air, the Commission had some difficulty in minimizing facts which were overwhelmingly in On the Air's favor. Alvin Q. Eades, president and director, was shown to have 7 other business interests and 7 civic activities. Martin L. Leich, executive vice president and director, was shown to have other business interests in radio broadcasting, to have had 4 years of active duty with the United States Navy, and to have participated in 17 civic organizations. Even so, there were omitted several items including active participation in Red Cross drives, being awarded the Bronze Star and receiving the Junior Chamber of Commerce Award for outstanding young man of the year.

In their findings in regard to Henry B. Walker—my father—vice president and director, his military record was dismissed with this comment:

* * * (he) has been a lifelong resident of this city except for his periods of active duty with the United States Army in World Wars I and II.

No mention was made of his having attained the rank of full colonel or of his having served as executive officer of Subsistence Division of Quartermaster General. His other business interests were dismissed without enumeration with the comment:

He holds extensive and varied business interests in Evansville and in other cities.

While these interests did not seem to impress the FCC, they have been partially responsible for his having been listed in Who's Who for a number of years.

The Commission revealed Mr. Walker's participation in 23 civic organizations but failed to mention his having been an officer or director in a number of others included in the record. The phrase "In addition to professional and social organizations * * *" successfully hid the fact of presidencies of the Evansville Bar Association, the Indiana State Bar Association, and the Federation of Insurance Counsel, a national organization, although mere past memberships in two of these organizations were enumerated for a nonvoting stockholder of Evansville Television.

Senator PASTORE. May I interrupt you at this point?

Mr. WALKER. Yes, sir.

Senator PASTORE. Was an appeal taken in this case?

Mr. WALKER. No, sir.

Senator PASTORE. Why not?

Mr. WALKER. Because the rejection or denying of our petition for a rehearing has not been publicly announced. We have been told that the vote was taken 3 weeks ago, which was to deny it.

Senator PASTORE. Is this case still pending?

Mr. WALKER. It is technically pending; yes.

Mr. COX. As you indicated awhile ago, however, I think you stated that your counsel advised——

Mr. WALKER. The opinion in Washington is practically unanimous that an appeal from the FCC is hopeless.

Mr. COX. Is that largely because of——

Senator PASTORE. Now, wait a minute. Let's get this cleared up. What do you mean it is hopeless—that our courts are a hopeless institution?

Mr. WALKER. No. The apparent power that has been given to the FCC to choose between applicants will not be upset by a court of appeals in most cases. There has to be almost a case of fraud.

Senator PASTORE. Do you expect the Congress to overrule the FCC?

Mr. WALKER. No, sir.

Senator PASTORE. Then why do you bring it here?

Mr. WALKER. I am going to go into the question of diversification of control of media of mass communication.

Senator PASTORE. I am not being critical of you, I am trying to get at your point here. You have 15 or 16 pages that I have to listen to, and I would like to get at the point.

Mr. WALKER. Over half of it, sir, is appendix.

Senator PASTORE. Apart from that, what is actually the point you are trying to develop before this committee?

Mr. WALKER. Our case is the only case in which an applicant for a TV station has been denied because of ownership of radio stations.

The Commission has appeared before this committee and has appeared before the House Committee on Interstate and Foreign Commerce and has stated that there would be no discrimination. They have stated, as I will develop later, that a radio station would be favored, and yet they have stated—or the examiner stated—that the very fact that we had operated a radio station and had done a good job and had been a service was the reason we were being denied.

Senator PASTORE. Is there anything more than that that you desire to present? Do you have any evidence that the Commission went beyond its realm in ruling against you because of ownership of a radio station?

Mr. WALKER. I have no evidence, no.

Senator PASTORE. Is there a representative of the FCC in this room? (No response.)

Well, I think the attorney of this committee ought to call this brief to the attention of the Commission, and we ought to have at least an answer to the subject matter that is being preferred here—let them make an answer.

You take the position that the only ground upon which your application was denied is because you were already in the radio business?

Mr. WALKER. Yes, sir.

Senator PASTORE. And they took other people in preference to you, as newcomers, who hadn't been in this field at all?

Mr. WALKER. It isn't even true in that respect. Rex Schepp——

Senator PASTORE. I would like to have you refine it, please, as much as you can.

Mr. WALKER. I would be glad to, sir. There were so many things that I could not condense it into a short statement.

Rex Schepp, who was to be 55 percent owner of all the stock of this corporation, has promoted and sold interests in 3 radio and television stations—1 television station in Phoenix, Ariz., 1 in Paterson, N. J., and a radio station in Phoenix, Ariz.

Senator PASTORE. Let me get this straight. This man actually applied for licenses other places, which were granted, and then he sold the facilities?

Mr. WALKER. Yes, sir; he has been a 25-percent or greater stockholder in 3; he was never a 100-percent stockholder.

Senator PASTORE. Then he came to your town where you were operating?

Mr. WALKER. Yes, sir.

Senator PASTORE. Was he a resident of that town?

Mr. WALKER. He was not a resident of that town. His brother had lived there and been an optometrist for about 10 years when he started this.

Senator PASTORE. And, without any previous business experience in this community, he formed a corporation and applied for this license?

Mr. WALKER. Yes, sir.

Senator PASTORE. And they told you that you had done a good job in rendering radio service, but because you were in the radio business they preferred this other newcomer to you in running a television station?

Mr. WALKER. Yes, sir.

Senator PASTORE. I think this brief ought to be referred to them, and we ought to get an answer on it.

Mr. Cox. Isn't it true that the only previous instances in which the FCC has applied its diversification standards have been to hold against newspapers who sought to acquire television licenses in areas where they controlled a dominating position in the dissemination of news?

Mr. WALKER. In newspapers, or a combination of newspapers and radio, or a combination of newspapers, radio, and TV.

Mr. Cox. But never radio alone?

Mr. WALKER. No case where it was radio alone.

Mr. Cox. And your company has no interest in other means of mass communication aside from WGBF, WTMV, and this association with WBOW?

Mr. WALKER. None whatsoever. WTMV is a local 250-watt station in East St. Louis. WBOW is a local station in Terre Haute, and, with the tremendous crowding that the radio spectrum has had in the last 10 years, they don't even get good reception on the outskirts of their own town.

Mr. Cox. How many radio stations are there in Evansville?

Mr. WALKER. Four in Evansville, 1 in Henderson, which is in the metropolitan area; 2 UHF stations in Evansville, and this VHF was to be a third. There is another VHF, channel 9, which is 18 miles from Evansville, and was brought in after the hearing started on channel 7. The only applicants for it are out-of-State owners in Kentucky. It is being applied for by two Owensboro, Ky., applicants with no Evansville person. It is closer to Evansville—or as close to Evansville as it is to Owensboro.

Mr. Cox. How many newspapers are there in Evansville?

Mr. WALKER. Two daily newspapers, and one daily newspaper in Henderson.

Mr. Cox. Do any people connected with your company have any interest in those newspapers?

Mr. WALKER. None whatsoever, nor with the motion pictures.

Senator PASTORE. I would appreciate it if you would allow us to put this entire document in the record, as you have presented it, including your appendix, and if you would more or less summarize, because what you are actually doing here, as I understand it, is stating a specific case.

Mr. WALKER. Yes, sir. There is no other case I know as well.

Senator PASTORE. I realize that, but I was wondering if you were going to persist in the desire of reading the entire background and history of the case. I think we understand it pretty much, and it ought to be in the record.

Mr. WALKER. I would appreciate it, for one reason, that I think a few things I am going to bring up might very well elicit some questions.

Senator PASTORE. Can't you point that out to me and put it in the record, because I have another meeting to attend, which is the reason I am asking. I am the only member of the committee here listening to you, and your interest, of course, is to bring it to the attention of the entire committee, and inserting it in the record will do precisely that. Then you can point out the salient points to me, and we can discuss it to and fro, without reading about 10 more pages of a written statement.

If there were more people here I would say it would be perfectly all right, and yet I am not shutting you off if you desire to do it that way; but I think, myself, it would serve our purpose better if we would insert the remainder of the statement in the record, and have it included in the record in its entirety, and then you can pick out the important points that you would like to bring out to me, consonant with the interrogation that has already transpired, because that is the crux of the matter; isn't it?

Mr. WALKER. Yes. The only reason I attempted to go into any questions on the merits was because I felt that I must go into it enough to convince you that the diversification of ownership of media of mass communication was the point on which they made the decision.

Senator PASTORE. I am not saying you are right, and I am not saying you are wrong—I am not getting into that—but you have made a rather important presentation here, and I think it deserves at least some answer on the part of the Commission to us.

Mr. WALKER. All right, sir.

Senator PASTORE. Apparently the presentation you are making here is that the man who is granted the license is more or less a professional applicant who goes around different parts of the country and then sells his interests outright.

Mr. WALKER. He has a record as a promoter.

Senator PASTORE. And this is the third time, and they granted him the license the fourth time in preference to a local operator who had already established a reputation, on the grounds that he was already in the radio business and for that reason they ought to give it to a stranger. Isn't that in essence what you are saying?

Mr. WALKER. That is it, sir.

Senator PASTORE. And that is your criticism of the Commission?

Mr. WALKER. Yes.

Senator PASTORE. I think the Commission ought to explain its position. We will have it understood on the part of the stenographer that the statement will go in the record in its entirety, including the appendix.

(The balance of Mr. Walker's statement is as follows:)

Mr. WALKER. In my own case as secretary and treasurer, the facts were also slanted. It was not found that I served as assistant military attaché to China during World War II although I modestly feel it might have some significance in regard to my own qualifications. No other business interests except radio and law were mentioned by the Commission although the record shows that I was an officer in at least 8 corporations in 5 lines of business not connected with radio and a director in another. In fact, my business activities have been sufficiently extensive that I have been listed in Who's Who in Commerce and Industry for a number of years.

The Commission found my participation in nine civic organizations but failed to mention participation in Red Cross and Community Chest drives, a directorship in Rotary, the presidency for 2 years of the Evansville Philharmonic Orchestra, the secretaryship of the Evansville Bar Association or my membership on the executive committee of the American Counsel Association. It is hardly necessary to go on and enumerate the activities of the remaining director who has died since the hearing.

WGBF introduced evidence of the business interests and civic activities of its voting stockholders and showed them engaged in 17 or more broad fields of business and participating in 46 different local civic organizations. The Commission chose to ignore these facts but to include the activities of all owners of nonvoting stock of Evansville Television. On the Air was so vastly superior to Evansville Television in regard to the factors of civic participation and diversification of business interests that any conclusion by the Commission that they were equal is not merely arbitrary and capricious but completely unconscionable.

As to the factor of integratiton of ownership with management a preference was given to Evansville Television because Rex Schepp, the controlling stockholder, a nonresident with no civic activities or other business interests, is to be the general manager of the company. There was every reason for the Commission to hold that On the Air, with its officers and directors owning more than 75 percent of the stock and with a long and fine record of performance, had definite superiority with respect to the integration of ownership with management.

I have gone into these other factors in some detail in order to substantiate my previous statement that without relying on the principle of diversification of ownership of media of mass communication as a point against WGBF, the Commission could not possibly have rendered its decision against WGBF.

This principle of diversification of ownership is not a requirement of law and can be supported only on the theory of preventing monopoly or as a form of share-the-wealth program.

A VHF station in Evansville could be expected to cover an area having approximately a 50-mile radius. Within that area today there are 19 AM radio and television stations and 19 daily newspapers. In the Evansville metropolitan area alone—Evansville and Henderson, Ky.—there are 5 AM radio stations, 2 television stations, 3 daily newspapers, and numerous other media of mass communication from without which saturate the area. Monopoly, therefore, is not an issue.

On the Air has operated WGBF in Evansville since 1928. At that time it was the only station within a 50-mile radius of Evansville. In 1935 this company established WEOA in Evansville which was also the second station within this area. On the Air continued to operate it until 1946 when it was required to sell the station under the FCC's so-called duopoly rules. Attached hereto and designated "schedule C," appendix, page 5, is a list of the AM radio and television stations within a 50-mile radius of Evansville as existing at 5-year intervals from 1930 to 1955. In 1930 and 1935, On the Air owned the only station in the area. In 1940, On the Air owned 2 out of the 4 in the area. In 1945 it owned 2 out of the 5 in the area. In 1950 it owned 1 out of 15, and in 1955, 1 out of 19 in the area. At one time On the Air had absolute control of broadcast media in this area. This control has dwindled to a point where it is ridiculous to apply the diversification rule as a reason to deprive On the Air of a television grant.

The Evansville case is the first decision in history in which the Commission has applied the diversification of ownership principle in denying an applicant a grant for a television station when the applicant owned radio stations only. The principle had formerly been applied at times when there were applicants with newspaper interests or newspaper and radio interests or a combination of newspaper, radio, and television interests. The use of this principle against On the Air is in absolute conflict with all announced policies of the Commission. The policy in this regard has been stated to this committee in the past as well as to the equivalent House committee.

Attached hereto and designated "Schedule D," appendix, page 7, is an excerpt from an article entitled "Diversification of Control of the Media of Mass Communication—Policy or Fallacy?" by Jerome H. Heckman, Georgetown Law Journal, volume 42, page 378, March 1954. This article reviews the legislative history of the McFarland Act and other legislation introduced in both the Senate and the House which would have specifically prevented discrimination by the FCC against any applicant for a license because of ownership of newspapers, radio stations, or other media of mass communication. Chairman Hyde of the FCC testified that the Commission had no objection and that there should be no discrimination. The antidiscrimination section was eliminated because this committee reported that the Commission was following a policy of no discrimination, intended to continue to follow such a policy, and has no legal or constitutional authority to follow any other procedure. The use of the diversification principle in the Evansville case is an absolute refutation of this announced policy.

Attached thereto and designated "Schedule E," appendix, page 11, are excerpts from the testimony of Chairman Paul Walker before the House Committee on Interstate and Foreign Commerce on February 20, 1953. Chairman Walker answered questions prefaced by this statement of Congressman Springer, "I think it is awfully important that your whole question of public policy be rather clear to people who are petitioning for stations." The Chairman's answers reveal a Commission attitude and policy identical with our own. Among other things, he said:

> * * * and it would be a pretty severe rule to say a man who has rendered a fine service in broadcasting that he was prohibited from going into television, particularly if television in a measure supplants the radio industry in the broadcast field.

When asked what the policy would be between an applicant with a radio station and one without, he implied that the broadcaster would be given preference in this language:

> I would say if you had a much better applicant who was not in radio that he would get the station.

Later he said:

> My fundamental philosophy is that the more competition you can get, provided the operators can exist and make a reasonable profit, the better. Again I say—and this is more a matter of innate justice to the man who has gone in

and developed a service to the community—to shut out a radio operator from getting into television simply because he has a radio station does not seem to me quite just.

The decision in the Evansville case is totally contrary to the policy thus declared. What short memories the Commissioners seem to have.

In its decision the Commission pointed out that On the Air owns or is affiliated with three radio stations. Certainly the fact has no bearing on any question of monopoly since the East St. Louis station and the affiliated Terre Haute station are local 250-watt stations whose listening areas are separated by many miles from the listening area of WGBF. Here again the diversification policy is insupportable. It overlooks the fact that television is a development and a refinement of the broadcasting industry and not a brandnew field.

As Chairman Walker pointed out, "television in a measure supplants the radio interest in the broadcast field." WGBF has been on the air since 1923, 2 years after KDKA, the first station in the country. On the Air has owned and operated it for 27 years and has a record of excellent service. To deny it the right to expand and grow with the industry is unfair and is economically disastrous. Because of the growth of TV, radio is a declining industry. From 1946 through 1954, net earnings, before taxes, for the whole radio industry declined steadily from $76.5 million to $41.8 million. During the same period the number of stations increased from 1,025 to 2,598, so that the average earnings per station declined from $74,634 to $16,089 or a decline of 78½ percent. Attached hereto and designated "schedule F," appendix, page 14, is a table showing this decline in radio earnings and the attendant rise in television earnings. In the same period On the Air's Evansville income—AM and FM—declined from $98,224 to a loss of $20,012. The 4 AM and 2 FM radio stations in Evansville declined from earnings of $142,700 in 1951 to a loss of $82,900 in 1954. These figures are set out in a table attached hereto and designated "schedule G," appendix, page 15. All of these figures are from figures filed with or published by the FCC.

I mentioned earlier the possibility that the diversification policy might be based on a "share the wealth" idea. The figures I have given should quickly dispel the possibility that a radio-station owner has any wealth to share. To illustrate even more graphically the situation with our three affiliated stations, there is attached hereto and designated "schedule H," appendix, page 16, a table showing comparative earnings for the first 2 months of 1956 and the same period of 1953. Our companies are faced with continuing losses which can only be mitigated by decreasing the services offered. Whether this will prevent eventual failure only time will tell.

The problem is not ours alone. According to the 1954 figures, 30 percent of the stations which had been operating prior to World War II were operating at a loss. There is no free enterprise in an industry which is subject to the controls of the FCC. The policies which have contributed to this critical situation should be reviewed from a realistic standpoint. The broadcast industry should not be led to the brink of ruin by some ivory-towered economists who say, as the Commissioners do, that they are not concerned with the economics of their licensees.

We have felt that we must have television to exist. We are faced with a choice of appealing the Commission's decision, with the resultant expenditure of additional large amounts of time and money and with only the slightest possible chance of success, or of attempting to buy an existing facility. In attempting to determine our future course of action we have talked to a staff member of the FCC. We are advised that the present plans of the FCC involve deintermixing Evansville and removing channel 7 to Louisville, which would make our 3-year fight a completely futile effort and the question of who wins a moot one; this after an expenditure for this channel which we estimate at over $300,000. At the same time VHF channel 9, which was allocated to Hatfield, Ind., a distance of 18 miles from Evansville, long after the channel 7 hearing began, would be left and would be owned by 1 of the 2 Owensboro, Ky., applicants fighting for it.

If a UHF channel is then allocated to Evansville to replace channel 7 it would leave Evansville dominated by a VHF station, channel 9, operated by an out-of-State owner, leaving three UHF stations in an already overcrowded broadcast market. Add to that the fact that the two existing UHF stations will have the advantage of more than 3 years of operation and have major chain affiliations at present, then one can see what a hopeless and confused and dismal picture is in prospect.

If the Federal Communications Commission is not concerned with the inequities and injustices of its actions and policies, it is time that someone becomes concerned before the broadcast industry suffers even more. If my appearance here results in bringing any benefits to the industry as a whole, we shall feel well repaid in having been of service to the industry. If by any chance it results in bringing any benefits to us, we shall be delighted.

SCHEDULE A

EXCERPT FROM CONCLUSIONS OF INITIAL DECISION BY EXAMINER SHARFMAN IN EVANSVILLE CHANNEL 7 TELEVISION CASE

(Docket No. 10462, 10463, 10464)

Between WGBF and Evansville Television, Inc., we must also evaluate the competitive significance of concentration of control of mass communication media, since WGBF, though it has no television stations, is substantially identified with aural broadcast facilities in the Indiana-Illinois area. While in a television case ownership of other communication media may not be as disadvantageous to an applicant in the comparative process as ownership of television facilities, it must be given its appropriate weight. Here WGBF owns 1 of the 2 most powerful AM stations in Evansville, an FM station there, and the only station (AM) in East St. Louis, Ill.; and its parent corporation owns all the stock of the licensee of an AM and an FM station in Terre Haute, Ind. Speaking of Evansville alone, a grant to WGBF would give it control over facilities in 3 commercial broadcasting media in 1 community, AM, FM, and TV. It would not have a monopoly of radio facilities in any of these fields, nor has it any newspaper interests, and the area is well supplied with both radio and newspaper services from other sources. Evansville Television, Inc., on the other hand, has no connection with any communication service other than in its pending application. As with WEOA, we must determine the significance of WGBF's involvement with communication interests, here vis-a-vis Evansville Television, Inc.

It is not farfetched to say that Evansville Television, Inc., as already indicated, has deliberately fashioned its presentation so as to take advantage of the con-keen eye upon the Commission, surrounded himself with a group of local "coun-ventional criteria. We have no doubt that Mr. Schepp, an entrepreneur with a selors," for competitive purposes; and although we do not consider that they would have been nonowners because they had subscribed only to nonvoting stock, the fact that their participation in ownership was limited in this way throws some light upon Mr. Schepp's intentions. Evansville Television, Inc., program misclassification is another indication of its competitive spirit, and although it is not by any means a major element in this comparison complex, it should be given some consideration.

Granted these unfavorable aspects of Evansville Television, Inc.'s proposal, it is by no means bested in a comparison with WGBF. The black marks placed against it do not affect the basic virtues of its projected operation. There is not so great a difference between its case and WGBF's as to neutralize the importance of the factor of media diversification. In short, here again we must conclude that the applicant not identified with other communication facilities should be preferred. We do not come to this determination without some misgivings because of the somewhat pedestrian nature of Evansville Television, Inc.'s presentation, a matter which has only been hinted at previously and which we see no need to elaborate upon further now. We hesitate to penalize Evansville Television, Inc., after it manifested enough concern to bring to the hearing most of its principals, and afforded us an opportunity to observe and appraise in the flesh the possibilities of its successful operation. Yet we must confess that were it not for the fact of ownership of other media we might very reasonably have preferred WGBF, and it is perhaps unfortunate that the very facilities whose long and successful operation naturally lays claim to our approval should furnish the basis for our ultimate determination against WGBF.

SCHEDULE B

EXCERPT FROM BRIEF AND EXCEPTION FILED BY CHIEF OF BROADCAST BUREAU OF FCC IN EVANSVILLE CHANNEL 7 TELEVISION CASE (DOCKET No. 10462, 10463, 10464)

The initial decision in the instant proceeding deprecates the mechanical application of the time-honored criteria utilized by the Commission in its quest for the applicant which is to be preferred in a comparative processing upon mutually exclusive broadcast applications. (See par. 6, conclusions, initial decision.) We are of the view, however, that after expounding this well-established truism the initial decision in this case itself falls into the very pit which it sought so studiously to avoid. Its failure to give proper weight to "countervailing considerations" in respect to its appraisal of the applicants here involved in the light of the Commission's recent pronouncements concerning the policies on concentration of media ownership and the diversification of control of mass communications media, led, in our view, to a mechanistic and incorrect result. Two of the three applicants, On the Air, Inc. (referred to herein as "WGBF") and WFBM, Inc. (referred to as "WFBM") are existing licensees with equally good performance records in the public interest insofar as the record of this case is concerned. The applicant which the initial decision prefers, Evansville Television, Inc. (herein referred to as "ETV") is a newcomer to broadcasting. Because neither ETV itself nor any of its principals own media interests at present the examiner applied the test of diversification of control of communications media, giving no weight to the differences, which we believe are significant, between the three applicants relating to local residence and community activities of their respective stockholders and directorates in the Evansville community. Similarly he did not consider the tried records of performance of the existing licensees of sufficient importance to influence the end result. We believe that these two factors, considered together, suffice to militate against a grant to ETV and in favor of a grant to WGBF and that the failure to give proper weight to such factors was error. Our rationale is set forth in detail below.

Schedule D

(Excerpts from Diversification of Control of the Media of Mass Communication—Policy or Fallacy? by Jerome H. Heckman, Georgetown Law Journal, vol. 42, p. 378, March 1954.)

The Legislative History of the McFarland Act and the Problem of Diversification of the Media of Mass Communication

Unlike the case law which leaves some doubt as to how the newspaper problem affects decisions on license matters, the legislative history of the communications amendments of 1952 gives a very lucid picture of congressional feeling on the subject.[1] The McFarland bill, the basis of these amendments, was, in most of its

[1] Communications Act amendment of 1952, 66 Stat. 711 (1952), 47 U. S. C. §§ 307 et seq. (supp. 1953).

important aspects, the same as a predecessor bill introduced into the 81st Congress and reported out of the Senate Committee on Interstate and Foreign Commerce.[2] This bill, S. 1973, read in s14:[3]

"Section 332. * * * The Commission shall make or promulgate no rule or regulation of substance or procedure, the purpose or result of which is to effect a discrimination between persons based upon race. religious or political affiliation, or kind of lawful occupation or business association." In the hearings on this bill, acting Chairman Hyde made this statement as to the Commission's position on the proposed new section:[4]

"This section proposes to add section 332. It is the so-called antidiscrimination section. the effect of which would be to prohibit the adoption of any rule which would prevent any person from securing a license because of race, religious or political affiliation, or business affiliation. The principal intent of the section is, of course, to outlaw the possibility of any rule excluding newspaper owners from owning radio stations. *There is no objection to this section.*" [Emphasis supplied.]

On further questioning as to s14 of S. 1973, Mr. Hyde stated:[5]

"I would like to say our comment on this section is 'No objection.' We mean by that that we feel there should be no discriminations, of course. Now, whether or not you wish to enact that kind of legislation is, of course, a matter for your consideration. I am just giving my own personal views, but I see no necessity for it because I think in principle *there should be none of these discriminations*, and I am not going to object to the legislation." [Emphasis supplied.]

Because of the strong denial of discrimination made by the Commission, section 14 was dropped from S. 1973 and this explanation was given in the committee report:[6]

The committee deems it important to point out why this section was dropped from the bill. This language was first proposed nearly 6 years ago during hearings on a Communications Act amendment bill, solely because the Federal Communications Commission at that time had under consideration a rule which would prohibit newspapers from becoming holders of radio licenses. While the Commission may have been motivated, in part at least, by the best intentions in seeking to prevent monopolistic control of organs of public expression in a community, the threatened action was of questionable constitutional validity, particularly in the absence of specific authority in the basic act to adopt such a rule. * * *

"*It should be distinctly understood that in eliminating this section the committee has done so solely because the Commission is now following the procedure which was outlined in the section, has testified that it intends to follow that procedure, and that it is of the opinion that it has no legal or constitutional authority to follow any other procedure.* [Emphasis supplied.]

When S. 1973 was reintroduced as S. 658 in the 82d Congress, the House version added to the bill the so-called newspaper amendment which read:[7]

"The Commission shall not make or promulgate any rule or regulation of substance or procedure, the purpose or result of which is to affect a discrimination between persons based upon interest in, association with, or ownership or any medium primarily engaged in the gathering and dissemination of information and that no application for a construction permit or station license, or for the renewal, modification, or transfer of such a permit or license, shall be denied by the Commission solely because of any such interest, association, or ownership."

This provision was accorded a lengthy airing on the floor of the House. Said Mr. Harris of the House Committee on Interstate and Foreign Commerce in reporting on the newspaper amendment:[8]

[7] Conference report on Communications Act amendments, H. Rept. No. 2426, 82d Cong., 2d sess. 18 (1952).

[8] 98 Congressional Record 7524 (June 17, 1952).

"It was the sole purpose of the amendment inserted by the House committee to make sure that newspaper applicants *will be treated on a par* with other applicants for radio and television licenses and that the Commission does not follow any abritrary policy which discriminates against those who are engaged in the gathering and dissemination of information." [Emphasis supplied.]

Representative Priest of the same committee further emphasized the legislative intent in stating:[9]

"Not only shall the Commission determine it (the granting of licenses, etc.) solely on the basis of public interest, but, on the other hand, no applicant shall have two strikes against him solely because of his interest in a news-gathering organization, corporation, or partnership, or whatever it might be."

And perhaps the best picture of the congressional state of mind can be obtained from a statement by Representative Rogers of Florida during the same House debate. Said Representative Rogers:[10]

"Mr. Chairman, we discussed this problem in detail in the Interstate and Foreign Commerce Committee. As stated by the gentleman from Tennessee (Mr. Priest) he offered the amendment and after long discussion of it I do not believe there was any opposition at all when it came to a final vote on the amendment. All of us concurred in the viewpoint that there should be *no discrimination against newspapers*. That is all it means. It is simple. It says that the Commission shall issue no rules or regulations that will discriminate in any way against newspapers, newspaper owners, or those associated with the newspaper business. That is all that is provided. It is in the negative; it states they shall not refuse to issue a license solely because of the fact that one may have an interest in a newspaper. I think that is a fair provision. If a man owns a newspaper and shows that it is in the public convenience and necessity for him to operate a station in his vicinity I do not think that the Commission should hold that against him. I do not think they should say to him: 'You have a newspaper down here so we will not give you a license to operate a radio station.'" [Emphasis added.]

These were clear expressions of congressional attitude. The Commission convinced Congress that this attitude corresponded to the position the Commission intended to maintain. For this reason the conference committee on the McFarland bill decided to drop the newspaper amendment after a careful reiteration of the congressional position, and a full explanation as to the reason for deleting the amendment. The conference report reads as follows:[11]

"The Senate bill contained no such provision, and the provision is not included in the conference substitute because the committee of conference felt that it was unnnecessary. It is the view of the conference committee that under the present law the Commission is not authorized to make or promulgate any rule or regulation the effect of which would be to discriminate against any person because such person has an interest in, or association with, a newspaper or other medium for gathering and disseminating information. Also the Commission could not arbitrarily deny any application solely because of any such interest or association."

From all this it may be concluded that Congress stands squarely in accord with the Court's ruling in the Stahlman case.[12] It would seem that the strong position taken by Congress would have settled the newspaper issue on a "no discrimination" basis but recent developments belie the truth of such a conclusion.

SCHEDULE E

During hearings before the House Committee on Interstate and Foreign Commerce, 83d Congress, 1st session, Friday, February 20, 1953

EXCERPTS OF TESTIMONY OF PAUL A. WALKER, CHAIRMAN, FEDERAL COMMUNICATIONS COMMISSION

Mr. SPRINGER. I think it is awfully important then that your whole question of public policy be rather clear to people who are petitioning for stations. It is my understanding that you did in the so-called public interest deny applications of newspaper owners who were in competition with nonnewspaper owners for the same radio facilities.

---

[9] Id., at 7530.
[10] Id., at 7551.
[11] See N. 60, supra.
[12] 75 U. S. App. D. C. 176, 179, 126 F. 2d 124, 127 (1942).

Commissioner WALKER. I would not go quite that far.[13] I think in our radio broadcasting cases, particularly in our earlier decisions, where we had two applicants equally qualified, in the interest of diversity, that we preferred the nonnewspaper applicant to the newspaper applicant, and as I say, to get diversity of community of interest operating in the community.

Mr. SPRINGER. That was in order that the news outlets in the community or the sources of information would be in separate hands; am I right on that?

Commissioner WALKER. That is right.

Mr. SPRINGER. Have you adopted the same policy with reference to television?

Commissioner WALKER. No; we have not had a case before us in which that question was raised, so that we have not had to pass on that policy. However, there has been certain proposed legislation in Congress, and certain debates and reports that probably would make us more conservative along this line, and I am not sure that there is not some provision, or at least some consideration in the McFarland Act. I am advised that the Congress did not make any definite provision in the law, making any direction to the Commission in reference to newspaper applicants.

* * * * * * *

Mr. SPRINGER. Now, let me ask you this: Have you adopted this same public policy where radio and nonradio interests have been competing for television facilities?

Commissioner WALKER. No; we have not. Television is going to play such a tremendous role in communications that I think that if some of these broadcasters found themselves out in the cold, so to speak, not being able to apply for some of the television stations, that they would be up against it in broadcasting, and it would be a pretty severe rule to say to a man who has rendered a fine service in broadcasting that he was prohibited from going into television, particularly if television in a measure supplants the radio interest in the broadcast field. I do not mean by that to disparage radio broadcasting. There will always be radio broadcasting, in my opinion. Further, in my mind, I do not believe that the radio broadcasters will be forced out of business by television. But as I say, it would be a pretty severe rule which would say to a competent radio broadcaster that he could not get into the television field. You have to have fairness toward the operator and the public interest, fairness to the operator on the one hand, and a diverse opinion about the public interest on the other. I would not say that we should not grant to a broadcaster a telvision station just simply on that factor.

Mr. SPRINGER. My question was only where you had those who were seeking it who were in radio and those who were not seeking it in radio [sic].

Commissioner WALKER. I would say if you had a much better applicant who was not in radio that he would get the station. But I cannot figure the fact that a man has a radio station would weigh much against him at the moment, because I think he would feel that he was pretty much being put out of business if he knew he could not get a television station because he was in the radio broadcasting business.

Mr. SPRINGER. Are you arriving at that on economic interest or on a question of public policy?

Commissioner WALKER. Not on economic interest. I just have a feeling of innate justness about the thing. I cannot feel that you would deny a man a television station simply because he was in the radio broadcasting business.

* * * * * * *

Mr. SPRINGER. I am trying to get your fundamental philosophy of what you think of placing television and radio under the some people.

Commissioner WALKER. My fundamental philisophy is that the more competition you can get, provided the operators can exist and make a reasonable profit, the better. Again I say—and this is more a matter of innate justice to the man who has gone in and developed a service to the community—to shut out a radio operator from getting into television simply because he has a radio station does not seem to me quite just. I would like to see in the community another television station. I think in any community which is large enough to support the stations that you always get better results with the competition; that is, a reasonable amount of competition.

---

SCHEDULE F

Radio and television—Earnings before Federal taxes

RADIO

	Earnings	Number of stations	Average per station
1946	$76,500,000	1,025	74,634
1947	71,800,000	1,464	49,044
1948	64,100,000	1,824	35,142
1949	56,300,000	2,021	27,857
1950	68,200,000	2,229	30,637
1951	57,500,000	2,266	24,896
1952	60,100,000	2,380	25,252
1953	55,000,000	2,479	22,186
1954	41,800,000	2,598	16,089

TELEVISION

	Earnings	Number of stations	Average per station
1948	($14,900,000)	50	
1949	(25,300,000)	98	
1950	(9,200,000)	107	
1951	41,600,000	108	
1952	55,500,000	122	
1953	68,000,000	334	
1954	90,300,000	410	

SCHEDULE G

Revenue and income from all AM-FM stations in Evansville compared with revenue and income from On the Air, Inc., stations in Evansville

Year (1)	Gross broadcasting revenue for all AM-FM stations in Evansville (2)	Gross broadcasting revenue of On the Air, Inc. AM-FM stations in Evansville (3)	Total number AM-FM stations in Evansville (4)	Number of On the Air, Inc. AM-FM stations in Evansville (5)	Net income (or loss) of all stations in Evansville (6)	Net income (or loss) of On the Air Inc. stations (7)
1945		$343,031	3	3		$104,251
1946	$440,579	361,740	3	3	$131,070	98,224
1947	624,137	291,792	4	2	141,601	54,408
1948	790,020	323,853	6	2	127,453	56,833
1949	807,101	290,690	6	2	66,824	16,743
1950	929,850	317,000	6	2	128,153	39,724
1951	907,856	311,616	6	2	142,737	44,749
1952	943,142	304,728	6	2	125,870	50,413
1953	987,641	312,855	6	2	36,061	33,106
1954	761,615	243,586	6	2	(82,917)	(20,014)
1955	671,424	216,315	6	2	(62,624)	(17,947)

NOTES.—Figures in cols. (2) and (6) for years 1945 to 1950, inclusive, include amounts for Henderson, Ky., as well as Evansville stations. Beginning with 1951 the figures are for Evansville only.

In 1953, 2 television stations, 1 at Evansville and 1 at Henderson, went on the air (WFIE and WEHT).

AM-FM stations in Evansville for 1945-46 were WGBF, WEOA and WMLL (FM); in 1947 WIKY was added; in 1948 WJPS and WIKY-FM were added.

SCHEDULE H

Table showing profit and loss for first 2 months of 1953 and 1956 for On the Air and affiliated companies

	1953	1956
Evansville operation:		
January profit or (loss)	2,697.33	(2,434.68)
February profit or (loss)	3,357.91	(3,701.84)
Total	6,055.24	(6,136.52)
Terre Haute operation:		
January profit or (loss)	1,108.85	(4,048.12)
February profit or (loss)	1,304.04	(2,668.90)
Total	2,412.89	(6,717.02)
Total for Evansville and Terre Haute	8,468.13	(12,853.54)
St. Louis operation:		
January profit or (loss)	3,317.40	1,213.54
February profit or (loss)	2,302.05	743.24
Total	5,619.45	1,956.78
Total for Evansville, Terre Haute and St. Louis	14,087.58	(10,896.76)
Parent corporation:		
January profit or (loss)	433.21	567.68
February profit or (loss)	433.21	650.38
Total	866.42	1,218.06
Consolidated net profit or (loss)	14,954.00	(9,678.70)

SCHEDULE I

Radio station DGBF, Evansville, Ind.—Revenue from NBC network affiliation

1945	$58,323.51	1951	50,652.78
1946	66,428.09	1952	42,514.15
1947	66,981.26	1953	30,031.32
1948	69,248.20	1954	17,810.47
1949	58,387.32	1955	9,981.27
1950	58,451.91		

Corresponding revenue for first 4 months of 1956 was $1,055.89, or an annual rate of $3,167.67.

(The oral colloquy proceeded as follows:)

Senator PASTORE. You may proceed.

Mr. WALKER. The principle of diversification of ownership is not a requirement of law and can be supported only on the theory of preventing monopoly, or as a form of share the wealth program.

Now, I would like to say, by the questions you have brought out, there are 19 radio and television stations within an area of 50 miles of Evansville, which is the approximate area this station would cover. There are 19 daily newspapers in the area. There are many other weekly newspapers in small towns, and there are many other media which impinge upon that area from the outside, so there cannot be any question of monopoly of any kind.

The Evansville case is the first decision in history in which the Commission has applied the diversification of ownership principle in denying an applicant a grant for a television station when the applicant owned radio stations only.

Senator PASTORE. Well, let me say this to you. In my community we have two channels, channel 10 and channel 12, and the operators of each of the channels had radio stations before they took on their TV licenses. Now, that is precisely the situation in my State.

Mr. Cox. And in most places.

Senator PASTORE. And now you are making the presentation here that that was the one point they used to rule against you?

Mr. WALKER. That this policy is in absolute contradiction.

Senator PASTORE. I think it needs explanation; I think you have made your point, and I think it ought to be explained.

Mr. WALKER. I refer to statements in the appendix by Chairman Hyde of the FCC when he appeared before this committee, and I think he also appeared before the House committee. I have in the appendix excerpts from the committee reports as to why the antidiscrimination section was left out of the bill.

Senator PASTORE. Let me ask you this question, sir. The examiner ruled against you?

Mr. WALKER. Yes, sir.

Senator PASTORE. And ruled for this other group that got it. Was the examiner's report reviewed by the Commission, and did they rule thereon?

Mr. WALKER. There was oral argument on that.

Senator PASTORE. And have they made a decision on it?

Mr. WALKER. Yes, sir.

Senator PASTORE. And they agreed with the examiner?

Mr. WALKER. Yes, sir; even though the Broadcast Bureau filed a brief and exceptions, and recommended that it be granted to us, and the examiner in his record used this language:

> Were it not for the fact of ownership of other media we might reasonably have preferred WGBF, and it is perhaps unfortunate that the very facilities whose long and successful operation naturally lays claim to our approval should furnish the basis for ultimate determination against WGBF.

Senator PASTORE. Was it brought out in the case that this man had already established a TV station in three other places before, and then sold out?

Mr. WALKER. Mr. Chairman, we not only brought that out, but brought out another point, that he has been in absolute violation of the Commission's rules three times, was subpenaed to Washington——

Senator PASTORE. I am not interested in that. I am interested in the point that the man has already applied three other places—got a license, sold it out; went to a new place, got another one, then did it again; and then came to your place and did it again.

Mr. WALKER. Yes, sir; and did not report his transfer of control in three cases, too, and the Commission was aware of that.

Senator PASTORE. The Commission was aware of that?

Mr. WALKER. They certainly were aware of that.

Senator PASTORE. I think we should bring this to the attention of the FCC and get something in the record explaining it.

Mr. WALKER. I would like to go on—I would like to read 2 pages, if I may.

Senator PASTORE. All right, go ahead.

Mr. WALKER. This gets into another overall question, aside from this, beginning at the bottom of page 13.

In its decision, the Commission pointed out that On the Air owns or is affiliated with three radio stations. Certainly the fact has no bearing on any question of monopoly, since the East St. Louis station and the affiliated Terre Haute station are local 250-watt stations whose existing areas are separated many miles from the listening area of

WGFB. Herein the policy is unsupportable. It overlooks the fact that television is a development and a refinement of the broadcast industry, and not a brandnew field.

As Chairman Walker pointed out, television in a measure supplants the radio interest in the broadcast field. WGBF has been on the air since 1923, 2 years after KDKA, the first station in the country. On the Air has owned and operated it for 27 years and has a record of excellent service. To deny it the right to expand and grow with the industry is unfair and is economically disastrous.

Because of the growth of TV, radio is a declining industry. From 1946 through 1954, net earnings before taxes for the whole radio industry declined steadily from $76.5 million to $41.8 million. During the same period, the number of stations increased from 1,025 to 2,598, so that the average earnings per station declined from $74,634 to $16,089, or a decline of 78.5 percent.

Attached hereto, and designated as "schedule F," appendix, page 14, is a table showing this decline in radio earnings, and the attendant rise in television earnings. In the same period, On the Air's Evansville income from AM and FM declined from $98,224 to a loss of $20,012. The 4 AM and 2 FM radio stations in Evansville declined from earnings of $142,700 in 1951 to a loss of $82,900 in 1954. These figures are set out in a table attached hereto and designated "schedule G," appendix, page 5. All of these figures are figures filed with or published by the FCC.

I mentioned earlier the possibility that the diversification policy might be based on a share-the-wealth idea. The figures I have given should quickly dispel the possibility that a radio-station owner has any wealth to share. To illustrate even more graphically the situation with our 3 affiliated stations, there is attached hereto and designated as "schedule H," appendix, page 16, a table showing comparative earnings for the first 2 months of 1956 and the same period in 1953. Our companies are faced with continuing losses which can be only slightly mitigated by decreasing the services offered. Whether this will prevent eventual failure only time will tell. The problem is not ours alone. According to the 1954 figures, 30 percent of the stations which had been operating prior to World War II were operating at a loss. There is no free enterprise in an industry which is subject to the control of the FCC.

The policies which have contributed to this critical situation should be reviewed from a realistic standpoint. The broadcast industry should not be led to the brink of ruin by some ivory-towered economists who say, as the Commissioners do, that they are not concerned with the economics of their licensees.

We have felt that we must have television to exist. We are faced with the choice of appealing the Commission's decision with a resultant expenditure of additional large amounts of time and money——

Senator Pastore. You are not actually saying that the Commission ought to grant you a TV license only because you are losing money running a radio station?

Mr. Walker. No.

Senator Pastore. You don't mean that; do you?

Mr. Walker. No, but I will say that Commissioner Walker, in his testimony before the House committee, said that very thing, that it was unfair to deny a radio station a license to operate because TV supplants in a large measure the radio interest in the broadcast field.

Senator PASTORE. I don't think they ought to hold it against you, that is the thing that I resent in the matter you have brought up. I don't think the fact that you owned a radio facility should have been held against you. That is the point I make. That is a horse of a different color. I go along with that thinking and that logic.

I don't think that a man who—I don't know whether it is true, now, and I hope the record will show that very clearly—but if what you say is true, that a man has become, so to speak, and I use the word in the broad sense, a professional applicant for TV stations which are granted and then sold, I suppose there—when you do sell it—it is capital gains you pay; and I tell you very frankly a fellow like that, within a few years, could write a book on how to become a millionaire.

Mr. WALKER. That is true.

Senator PASTORE. If he can get away with that—if what you say is true—I think that this committee is entitled to an explanation from the Federal Communications Commission; but I don't go along with the idea that just because a man who is operating a radio station goes in and shows he has been losing money that that, itself, ought to entitle him to be preferred over some qualified group.

Mr. WALKER. We didn't attempt to show that to the Commission at all. That has never been brought up. My point in bringing this up is to show the radio industry is a sick industry, and the policies of the Commission are largely responsible for it having become sick.

In 1946, there were 1,025 stations. In 1954, there were over two and a half times that many, so that beside the incoming of television there has been a tremendous increase in the number of radio stations. But a radio station cannot increase its power, or put up a higher tower, or do what a business under free enterprise can do.

Senator PASTORE. That probably should be given consideration, that that is part of the evidence before the Commission. However, I don't presume to try to decide their cases for them, and I don't think any Member of the Congress does. I think they should give weight to all the factors that go to promote the public interest, and a license should be granted in the public interest, and I will repeat again what I said before, that the matter that you have raised is one of very serious import and implication, and I think we ought to have an answer before we criticize any further.

Thank you very much, sir.

Are there any further witnesses before us this afternoon for or against?

Mr. WALKER. Mr. Chairman, may I make one point? I am sorry to be so persistent.

Senator PASTORE. Yes.

Mr. WALKER. Channel 7 was allocated to Evansville. The Commission is now advising that channel 7 will be deintermixed, or taken out of Evansville.

Long after the applicants for channel 7 started in hearing, channel 9 was allocated to Hatfield, Ind. 18 miles from Evansville, and the present proposal of the Commission is to leave channel 9 18 miles from Evansville—which will dominate Evansville with a VHF station—and remove channel 7.

Now, that isn't our case, because at the present time we are the unsuccessful applicant; but if they put a UHF channel in in place of channel 7, it will leave Evansville dominated by a VHF channel owned by out-of-State owners—operated by out-of-State owners—and that is something I think that should be given some consideration.

Senator PASTORE. You have raised that point in your statement, and that is the reason I suggest it ought to be answered before we go further.

Mr. WALKER. Thank you for your courtesy, sir.

Mr. COX. Will you let the record show that the statements of Mr. Gimbel and Mr. Walker will be published in the report of the hearings in connection with the testimony of the other witnesses regarding allocations matters?

Senator PASTORE. Very well. We are recessed, subject to call.

(Whereupon, at 3:40 p. m., the committee adjourned, to be reconvened subject to call.)

(Pursuant to the wishes of Senator Pastore, a copy of Mr. Walker's statement was sent to the Federal Communications Commission for its comments. Since the Commission had not yet ruled on a pending petition for reconsideration, the committee's letter was withheld pending final decision. However, Warren E. Baker, general counsel of the Commission, wrote to the chairman of the committee on June 8, 1956, with respect to this case.

(After the Commission's final decision in the case, Senator Magnuson again wrote to Chairman McConnaughey with respect to this matter. On July 17, 1956, the members of the Commission again appeared before the committee and at that time testified briefly with respect to Mr. Walker's testimony. (See p. 966 below.) At that time Mr. Baker's letter of June 8, 1956, was inserted in the record.

(Thereafter the committee received a letter dated August 30, 1956, from Chairman McConnaughey with reference to this case. This letter is printed at p. 971 below.)

TELEVISION INQUIRY

TUESDAY, JULY 17, 1956

UNITED STATES SENATE,
COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE,
Washington, D. C.

The committee met, pursuant to adjournment, at 10 a. m., Senator George A. Smathers, presiding.

Present: Senators Smathers, Pastore, Purtel, and Wofford.

Also present: Wayne T. Geissinger, assistant chief counsel; Kenneth A. Cox, special counsel; Nicholas Zapple, staff communications counsel.

Senator SMATHERS. Gentlemen, if the meeting will come to order, I might say I am pinch-hitting temporarily for Senator Pastore, who is having to attend a meeting of the Post Office and Civil Service Committee, but who shortly will be here. By way of introduction, I will read this prepared statement.

We are now nearing the conclusion of our television inquiry, for this session of Congress. We are glad to have the members of the Federal Communications Commission, who were our first witnesses, back with us again to again consider some of these problems in the light of what has happened since they last appeared. Before hearing them, however, we have a number of items to be inserted in the record. These are:

First, a letter from Congressman Donald W. Nicholson requesting that the listing of his name with those of other members of the Massachusetts delegation in connection with telegram published at page 52 in the first volume of our hearings be disregarded.

Second, an exchange of correspondence between Senator Magnuson and the Firestone Tire & Rubber Co., which will be published in connection with the testimony of Wilbur M. Havens. (See volume on Network Practices.)

Third, an exchange of correspondence between Senator Magnuson and the Federal Trade Commission as to whether the latter has authority to encourage the manufacture and sale of all-channel sets through labeling requirements or otherwise.

Fourth, a letter from Leonard H. Marks, who appeared before the committee on June 11, 1956, correcting one phase of his testimony. This will be printed in connection with his testimony. (See p. 912.)

Fifth, a letter from the Federal Communications Commission regarding the status of channel 21 in Louisville, Ky., pursuant to an inquiry directed by Senator Pastore as a result of the testimony of Sarkes Tarzian. (This is printed in connection with the latter's testimony in the volume on Network Practices.)

Six, 3 letters from Dr. Frank Stanton: (*a*) One dated June 14, 1956, regarding certain of his testimony touching on clearance for national spot film programs as reported by the Television Bureau of Advertising; (*b*) one dated June 27, 1956, regarding certain of his testimony on affiliation coverage in the Fresno-Bakersfield area; (*c*) one dated June 22, 1956, commenting on six bills relating to political time, pursuant to the request of Senator Magnuson. (These are printed in the volume on Network Practices.)

Seven, a statement on network practices by Paul R. Bartlett of KFRE-TV. This will be printed in connection with the testimony of other CBS affiliates on June 18, 1956. (See volume on Network Practices.)

Eight, statements or letters on network practices submitted by nine affiliates of NBC, which will be printed in connection with the testimony of other NBC affiliates on June 20, 1956. (See volume on Network Practices.) The nine are: Robert B. Ferguson, WTRF-TV, Wheeling, W. Va.; Les Biederman, WPBN-TV, Traverse City, Mich.; Walter J. Damm, WTMJ-TV, Milwaukee, Wis.; Harold P. See, KRON-TV, San Francisco, Calif.; Douglas L. Manship, WBRZ-TV, Baton Rouge, La.; David M. Baltimore, WBRE-TV, Wilkes-Barre, Pa.; Nathan Lord, WAVE, Inc., Louisville, Ky.; Ralph J. McElroy, KWWL-TV, Waterloo, Iowa; and Harold C. Stuart, KVOO-TV, Tulsa, Okla.

(The documents referred to except for those shown to be printed elsewhere, are as follows:)

CONGRESS OF THE UNITED STATES,
HOUSE OF REPRESENTATIVES,
Washington, D. C., June 26, 1956.

Hon. WARREN G. MAGNUSON,
Chairman, Committee on Interstate and Foreign Commerce,
Senate Office Building, Washington, D. C.

DEAR MR. CHAIRMAN: It is my understanding that my name is listed with other Members of the House of Representatives from Massachusetts on page 52 of the testimony before your committee on the television inquiry.

I would appreciate it if you would disregard my name on this petition.

With kindest regards, I am,

Sincerely,

DONALD W. NICHOLSON.

JUNE 1, 1956.

Hon. JOHN W. GWYNNE,
Chairman, Federal Trade Commission,
Washington, D. C.

DEAR MR. GWYNNE: As you know, the Senate Interstate and Foreign Commerce Committee has been conducting an inquiry in regard to television allocations. From the testimony heard it is clear that one of the major obstacles to the development of UHF broadcasting has been the fact that the manufacturers of television receiving sets find it in their own interest to manufacture sets capable of receiving only the 12 VHF channels. As a result, some 85 percent of the sets now being manufactured are thus incapable of receiving 72 UHF channels, so that a UHF broadcaster must persuade the public in his area to make an additional expenditure to convert his set to receive the UHF signal. A somewhat similar problem may have arisen, it would appear to me, when the AM radio band was expanded to 1600 kilocycles. I would be interested in knowing what, if any, steps the Federal Trade Commission may have taken at that time to insure that no sets were offered to the public which were not capable of receiving all broadcast radio signals.

In particular, I would like to know whether the Commission either required full reception through some sort of labeling requirement or whether it proceeded against manufacturers for an unfair trade practice or for false and fraudulent advertising if they attempted to sell sets which could not receive the full range of radio signals. The reason for my inquiry, of course, is that it has occurred to me that you might possibly be able to assist us in promoting the manufacture of all-channel television sets exclusively. The difference in cost to the manufacturer between a VHF-only and an all-channel set can be as low as $10. However, this means a difference in retail price of $25 or $35 so that as long as VHF-only sets are available a certain percentage of the public will buy them, particularly where no UHF service is yet available. Then when a UHF station later goes on the air it is faced with the fact that its VHF competition has 100 percent circulation, while the new station starts off with a circulation of anywhere from zero to 15 percent.

I am wondering whether the Federal Trade Commission would have the power to require either that all sets offered to the public be capable of receiving all of the channels now allocated to the television service by the Federal Communications Commission, or alternatively, whether you would have the power to require a VHF-only set to be clearly labeled to indicate to the public that this particular receiver is incapable of receiving 75 percent of the channels on which television broadcasts may be received.

Such a label should spell out in some detail the fact that if the owner of the set moved to another area he might find that only UHF signals are available, and the fact that additional service in his community can be made available only on UHF channels. It seems to me that this might reduce the percentage of VHF sets now being purchased. Apparently one problem in this connection is that the average television receiver salesman has no real understanding of the UHF problem and is so anxious to make a sale that he is quite willing to push the VHF-only receiver if it appears that the purchaser is reluctant to pay the somewhat higher price of an all-channel set.

It is perfectly clear from the testimony which has been heard by our committee that the UHF frequencies must be preserved and promoted if this country is ever going to have the kind of nationwide competitive television it needs. Anything which the Federal Trade Commission could do to promote the sale of all-channel television receivers would be a real contribution toward the solution of this very difficult problem.

May I please have your comment on these matters at your earliest convenience? Thank you for your cooperation.

Sincerely yours,

WARREN G. MAGNUSON.

FEDERAL TRADE COMMISSION,
Washington, D. C., July 6, 1956.

Hon. WARREN G. MAGNUSON,
United States Senate,
Washington, D. C.

DEAR SENATOR MAGNUSON: This is in further reference to your letter of June 1, 1956, relating to the competitive handicaps being encountered by UHF television broadcasting, as revealed in the investigation now being conducted by the Committee on Interstate and Foreign Commerce. You inquire in those connections as to any legal machinery available under statutes administered by the Commission for promoting sales of all-channel television sets as a means of minimizing those obstacles to the growth of UHF broadcasting and furthering the development of nationwide competitive television.

It thus appears that manufacturers of television receivers find it to their interest to emphasize the production of sets capable of receiving the 12 VHF channels rather than all-channel sets; that approximately 85 percent of the receivers now being manufactured are incapable of receiving the 72 UHF channels; and that a new UHF station, when it begins operation in an area already served by a VHF station, has the competitive handicap of a circulation of anywhere from zero to 15 percent and the burden of persuading the public to incur expense in converting their sets to receive the UHF signal. You also call attention to another relevant factor, namely, the general lack of understanding of the UHF problem existing among retail salesmen and their consequent willingness to push sales of VHF receivers when the purchaser evidences reluctance to pay the price of an all-channel set which ranges $25 to $35 above the other type.

The AM radio band was expanded from 1,500 kilocycles to 1,600 kilocycles prior to the war and you inquire as to any Commission proceedings instituted in that era which challenged the promotional practices for radio sets incapable of receiving the full range of signals afforded by that expansion of the bank. My inquiry into the matter does not indicate that the Commission was the receipient of any complaints, from consumers or the trade, relating to the marketing of sets which were so deficient. Our records disclose no action or proceeding in that regard.

Your letter also inquires if the Commission has the power to require that all sets offered to the public be capable of receiving all channels now allocated to television service. Under the Federal Trade Commission Act, the Commission's mandate is to prevent the use in commerce of unfair methods of competition and unfair and deceptive acts and practices. Hence, the Commission's jurisdiction ordinarily does not extend to forbidding introduction into or the sale in commerce of an article of merchandise. Its corrective action instead is directed against further use of the unlawful acts or methods under which distribution of the merchandise was promoted in the first instance.

This holds true save in exceptional cases where the questioned practices appear violative of some statutory expression of national policy additional to that contained in the Federal Trade Commission Act. An example of a proceeding in this categry is one directed against violations of the Flammable Fabrics Act, the statute which protects the public from dangers resulting from the marketing and use of highly flammable wearing apparel produced for shipment in commerce. However, the principle controlling in those types of cases is absent in the situation to which your letter relates. Even assuming that the merchandising of VHF receivers has been characterized by practices violative of the Federal Trade Commission Act, it is believed nonetheless that the Commission would lack the power to require that the shipment and sale in commerce of television sets be limited to the all-channel category of receivers.

Your letter also inquires as to the Commission's basic authority to require that a set limited only to VHF reception be clearly labeled to indicate that the receiver is incapable of receiving 75 percent of the channels on which television broadcasts may be received; and it requests similar comment by me on requirements for further disclosures by television manufacturers to the effect that the purchaser might find only UHF signals available should he move to another area and that expanded service in his community may be made available only on UHF channels. The Commission has the power to require inclusion of an appropriate statement on the label of an article being offered for sale in commerce concerning its limitations under normal conditions of use when the circumstances are such that the failure to disclose material facts in respect thereto results in deception to the consuming public. Thus, if evidence were available which supported informed determinations that sets limited to reception of VHF signals were being passed off as all-channel receivers, without any affirmative misrepresentations being resorted to for effecting that result, the failure by the seller to reveal the material facts as to his sets' limitations in that respect clearly might be actionable under the Federal Trade Commission Act.

This legal principle underlies rule 2 (d) of the Trade Practice Rules for the Radio and Television Industry as promulgated by the Commission on June 28, 1955. Copies of the rules are enclosed. Under that rule, the term "television receiver," as descriptive of a set, "shall not be used in such manner as to lead the public to believe that such set is constructed for, and capable of receiving with reasonable or adequate consistency, a greater number of * * * television frequency signals or channels than is in fact true of such set."

The revealing statements noted in your letter look to explaining certain potential consequences which may result from purchase of sets which do not afford UHF reception. The Commission has not received any complaints indicating that purchasers living in areas which already have UHF stations are buying VHF receivers under the impression that their sets will receive, without modification or adaptation, all television signals currently broadcast in their areas. Furthermore, the information secured at the time when the aforementioned trade practice conference was being conducted did not afford adequate support for conclusions that the term "television receiver" has been understood by the public to connote sets thus capable of receiving all channels allocated by the Federal Communications Commission to broadcasting purposes.

Nor is the Commission in receipt of information indicating that, in addition to his obvious desire to view current local programing, the purchaser likewise buys his television receiver under an impression or belief that he will be enabled to receive all programs afforded as a result of television's expansion in his community and those to be presented wherever he subsequently may take up residence. In the absence of evidence supporting informed determinations that a substantial segment of the public is in one or both respects so motivated in its

purchases, there would be no valid legal basis for requiring a disclosure in advertising or labeling of the matters noted in your letter in reference to potential limitations attending use of sets which are not all-channel receivers.

Please be assured of the Commission's desire to cooperate with the committee. The committee's published report on the hearings will be noted with great interest.

Very sincerely yours,

JOHN W. GWYNNE, *Chairman.*

Senator SMATHERS. I might say that the record will be kept open, after the conclusion of these hearings, until September 15, so that if anyone wishes to file a statement he can do so up to that time.

Our first witness this morning, and we are very happy to have him over here again, is the Chairman of the Federal Communications Commission, Chairman McConnaughey.

Mr. Chairman, when you are ready.

Mr. MCCONNAUGHEY. I am ready.

Senator SMATHERS. Do you have a prepared statement?

Mr. MCCONNAUGHEY. No.

STATEMENT OF GEORGE C. McCONNAUGHEY, CHAIRMAN, FEDERAL COMMUNICATIONS COMMISSION, ACCOMPANIED BY COMMISSIONERS ROSEL HYDE, ROBERT BARTLEY, ROBERT E. LEE, RICHARD MACK, T. A. M. CRAVENS, AND WARREN BAKER, GENERAL COUNSEL, MR. LOUIS STEPHENS, AND MR. HART S. COWPERTHWAIT

Mr. COX. Mr. McConnaughey, I would like to ask a number of questions initially in the light of your action on June 25, in your allocations proceeding.

Would it be fair to say that, as a result of considering all of the proposals that were made to the Commission in your allocations proceeding, the Commission has either reached or has reaffirmed these conclusions: First, that 12 VHF channels are not adequate to provide a nationwide competitive system?

Mr. MCCONNAUGHEY. That is correct.

Mr. COX. Second, that no additional VHF channels can be obtained from other services, at least in sufficient quantities to provide such a service?

Mr. MCCONNAUGHEY. None that we know of today.

Mr. COX. Third, that it is not possible, without serious degradation of service, to squeeze in enough VHF channels through reduction of separations or otherwise to provide a desirable service?

Mr. MCCONNAUGHEY. To provide what?

Mr. COX. A desirable service.

Mr. MCCONNAUGHEY. Well, I think that is true; yes.

Mr. COX. So that taking these three together, it is implicit in the Commission's conclusions that there does not seem to be a possibility of an all-VHF service of the magnitude that the country requires?

Mr. MCCONNAUGHEY. That is correct.

Mr. COX. Now going on from that, the Commission concluded, did it not, that as a consequence it is imperative that we make full use of the UHF portion of the television band in order to develop such a service?

Mr. MCCONNAUGHEY. That is correct.

Mr. Cox. You concluded, as I understand it, that it did not appear that this could be accomplished through deintermixture alone, without serious and abrupt disruption of existing service?

Mr. McConnaughey. That is correct.

Mr. Cox. So it seemed to you that the only real long-range alternative which was left was to try for an all-UHF service—in the whole country or in a major portion of the country—with interim deintermixture on a selective basis to maintain UHF in the meanwhile?

Mr. McConnaughey. I think that should be the ultimate objective; yes, sir.

Mr. Cox. And in that connection, you called for an increased, a stepped-up program of research and development in order to promote the most rapid possible development of UHF to a condition of equality, or near equality, with VHF?

Mr. McConnaughey. That is correct.

Mr. Cox. Is it fair to say that your conclusion was reinforced, in this connection, by the growing demands of other services which might possibly, if you effect this shift to all UHF, be accommodated in some of the present VHF?

Mr. McConnaughey. That was certainly in our thinking.

Mr. Cox. And in addition was this conclusion reinforced by the fact that there would seem to be certain inherent advantages in an all-UHF service in the nature of the service—the all-band service—in having a completely contiguous service with a minimum variation in frequencies, and things of that kind?

Mr. McConnaughey. That is correct, if the developments can come along.

Mr. Cox. Now, as I understand it, the Commission has not, however, presently decided to transfer all television to UHF?

Mr. McConnaughey. Oh, no.

Mr. Cox. It has decided, however, has it, to do this at the earliest possible future date, if its expectations as to the possibility of improving UHF technically turn out well?

Mr. McConnaughey. I think that the order indicates that the Commission—the majority of the Commission—if the developments occur with reference to UHF developments, that they would look toward moving a portion of the country, or all of the country, to UHF in the final analysis. I think that is inherent in the order itself.

Mr. Cox. Would you say that the only——

Mr. McConnaughey. Providing there would be a transition period there for amortization and a period of time where the public would not be disrupted to an inordinate extent.

Mr. Cox. Yes, indeed.

Well, then, is it accurate to say that the only condition remaining to be satisfied before such a shift, either on a nationwide basis or on a regional basis, is the technical development of UHF to a point where it seems clear to the Commission that it can provide an adequate television service alone?

Mr. McConnaughey. I think fundamentally that is true, that we must await the developments to see what can be done toward moving toward UHF.

Mr. Cox. Now, is it the feeling of the Commission—based on the progress that has been made in UHF technology in the last 4 years—that the chances are good that this can be done, and that therefore in the foreseeable future the Commission would expect actually to effectuate this program?

Mr. McCONNAUGHEY. Mr. Cox, I do not know whether there have been sufficient developments to make that appear possible very—I mean real soon. I do think that there have been developments made that are very encouraging from the standpoint of the UHF transmitters and receivers.

Mr. Cox. That is, the Commission knows of no fundamental characteristics of UHF which makes it impossible to develop it—through improved transmitters, receivers, tubes, antenna, and so forth—to develop an all-UHF service which would provide either the same, or very nearly the same, service now being provided by VHF?

Mr. McCONNAUGHEY. I am not, as you know, Mr. Cox, a technician, but I do understand that the UHF so far will not give the distance signal as clear, there are shadow areas, there are interruptions from trees and leaves, and in certain mountainous countries—mountainous parts of our country—there are a great many difficulties to be encountered.

Those are technical things which I just cannot answer. I know there are a lot of those things that UHF is going to have to overcome. It is not, as of today, a service comparable to the VHF.

Mr. Cox. Do your engineers advise you, though, that it has the potentiality to become such within the foreseeable future?

Mr. McCONNAUGHEY. I don't think Mr. Allen is here—he is the chief engineer. I don't know as he would go that far, because the developments in the shadow areas and the propagation characteristics have not, as I understand it, been yet developed to where it is a service that can begin to do the same job as the VHF service. It does a good job for short distances, I think, if we had the receivers properly developed and the antennas.

Mr. Cox. In that connection, you suggested, did you not, that attention be given to further development of satellites for use in trying to fill in shadow areas and things of that sort?

Mr. McCONNAUGHEY. That is right; that is right.

Mr. Cox. Now, I take it that this was the reason for calling for this program of expedited research and development?

Mr. McCONNAUGHEY. Yes, sir.

Mr. Cox. To try to bring UHF along to the point where, it is hoped by the Commission, it could provide a service—an all-UHF service—at least in the more densely populated parts of the country?

Mr. McCONNAUGHEY. To where it would be a satisfactory service to the public.

Senator SMATHERS. Counsel, let me ask a question there. I am somewhat uninformed on this particular problem. But following the lines of thinking of Mr. Cox there, if you are able to make the UHF competitive then what would be the necessity of making everything all-UHF? Why, then, would you not be able to permit UHF and VHF to operate, you might say, contemporaneously if they are competitive, one with the other?

Mr. McCONNAUGHEY. So far, Senator Smathers, the UHF has not developed to the place where they are able to compete with the VHF.

Senator SMATHERS. But if, as Mr. Cox' questions suggest, it is possible, through research and improved technical media, to make UHF competitive by improving, as you say, the further range of it and the delivery of it over the airways, and so on—if that is possible, is that not, itself, a sufficient answer, or somewhat of an answer alone? Or is that not an answer? That is what I am trying to get at.

Mr. McCONNAUGHEY. If it could be made comparable, so it could be equally competitive, there would be no good reason for not utilizing both the V and the U. So far, that has not developed.

Mr. COX. Except, of course, for the possibility that you may find a need for the VHF channels for other services?

Mr. McCONNAUGHEY. That is right.

Mr. COX. Now, as I recall the terminology in your report, you indicated that——

Mr. McCONNAUGHEY. Let me complete my answer to Senator Smathers.

Mr. COX. Certainly, sir.

Mr. McCONNAUGHEY. There is one thing that is known, Senator Smathers, with reference to the V and the U, which so far as I know—and again I must say I am not a technician—so far as I know there is nothing to indicate that the UHF can get the same range as a VHF. I know of nothing in the offing to indicate that.

That means merely this: That difficulty is encountered—from what we know today, from what is in the foreseeable future—with reference to the U obtaining the same range as the V. Therefore, I am the Coca-Cola Co., and I won't buy the U because I can get a V which will give me the coverage of a lot more people. And that is something that exists today in a very substantial way, and is something that I do not know whether that, in itself, can ever be overcome.

Senator SMATHERS. So, then, your conclusion, as I gather—the Commission's general conclusion—is that, presuming that inequality can never be made up as between UHF and VHF, then your general suggestion was that there may be a possibility of doing away, as far as the public is concerned, with the VHF's and making everything UHF?

Mr. McCONAUGHEY. That is correct, sir.

Senator SMATHERS. In that connection, what would happen to all the folks who bought VHF sets and things of that nature?

Mr. McCONNAUGHEY. As indicated in our order of June 25, that would be taken care of by an amortization period of 5 to 7 years, we will say, for example, whereby the stations could operate on both the V and the U for a period of time to give the receivers—the people who own the receivers—time to amortize their investment.

Senator SMATHERS. How would you recompense the owners of the VHF stations; what sort of arrangement would be made with them?

Mr. McCONNAUGHEY. We would not recompense them. They would also have a period of time to amortize—which they are already doing. They naturally depreciate their equipment, and they would have a period of time to amortize that in order that——

Senator SMATHERS. Do you think you might run into a constitutional question of depriving people of property without due process of law?

Mr. McCONNAUGHEY. No, I don't think so. Do you want to answer that, General Counsel?

Mr. BAKER. The statute, itself, gives them no right to the frequency after the 3-year period, so obviously they have no constitutional right to a renewal beyond that period on the same frequency. I think the

Commission's contemplation would be longer than what the law, itself, would necessarily require.

Mr. Cox. Through a stepped-up depreciation they would be permitted to recapture the entire cost of their equipment out of income during that period?

Mr. McConnaughey. That is correct, Mr. Cox.

Senator Purtell. May I pursue that question a little further? When you spoke of range, you were not speaking only in the sense of range in the mileage covered, but also the manner in which it is covered? For instance, the terrain of the area covered would have a great deal to do with your so-called range?

Mr. McConnaughey. Yes. Before you came in, Senator Purtell, I mentioned that in some areas of the country UHF, so far, has had a very difficult time in obtaining any substantial proper reception.

Senator Purtell. Because of the terrain?

Mr. McConnaughey. Yes; in certain mountainous sections of the United States.

Mr. Cox. There are successful operations of UHF, however, in fairly rugged terrain—Scranton, Wilkes-Barre, places like that?

Mr. McConnaughey. That is correct, and there we get into a highly technical discussion, that I have talked to our chief engineer about, and we all have. Peculiar things happen, such as in the Wilkes-Barre situation where that is rugged country, and they seem to get pretty good reception. You can take in other sections where it is rugged, and they have encountered very serious difficulties.

Mr. Cox. Am I correct in my understanding, as you indicate, that there probably will be, for all time, a difference in the range to which these signals can reach out?

Mr. McConnaughey. I shouldn't make that statement, but that is my understanding from the engineers.

Mr. Cox. But even contemplating that, it is the position of the Commission that at least in the more densely populated areas—with foreseeable technical improvements—UHF could be brought to the point where, if it was not forced to compete with the greater range V stations, it could provide an adequate service by itself?

Mr. McConnaughey. That certainly is our hope and expectation.

Senator Purtell. May I ask what do you mean by "foreseeable"? Have we any reason to believe that this crash program, this contemplated development, will in fact be realized?

Mr. McConnaughey. Senator Purtell, I have not seen the demonstration, but I understand the General Electric Co. has developed a tube which will be on the market before long which is going to be a very substantial assistance. I also note that, in the statements they made in answer to our rulemaking—they are not manufacturers. Well, yes, they are manufacturers, such as RCA, and people of that kind. They all say that the U must be utilized. And I believe that the ingenuity of the American inventive genius, I call it—I have enough confidence in it to believe that they can and will make developments so there can be a proper coverage and proper utilization of UHF.

Senator Purtell. My reason for asking about "foreseeable"—actually we are hopeful that it can be done, but we cannot foresee it being done as yet, can we?

Mr. McConnaughey. I think that is a very fair statement. We can't foresee it; we can't sit here and foresee it today. But I certainly hope, and I believe that the Commission is going to use every effort that it possibly can to try to foster and promulgate the development with the manufacturers, coordinating with them in the development of the UHF antennas, transmitters, and receivers. And I made the statement on several occasions that I think we are going to have to ask the help of Congress. I can't sit here today and tell you exactly in what sphere, but I think it is serious enough with only 12 channels being utilized—you cannot get a nationwide television system. You have got to start on that premise. That being the case, you have to, in order to get a nationwide television system, in order to get rid of all this cry of monopoly, and all that sort of thing—and it is dangerous, I will admit, because you are dealing with something that is extremely sensitive and important when you are dealing with mass communications by voice and by picture—I believe that we may have to ask Congress to face up to it, and it is not going to be easy. It is going to take a lot of fortitude. I can't point my finger at the way. I don't know whether it is going to have to be that no receivers can be sent in interstate commerce unless they are all-channel receivers. I don't know whether that is constitutional, or whether it isn't.

The tax situation is something else. But I think along the line, when we get the comments of this rulemaking proceeding of June 27, we are going to have to come to you folks and ask your help.

Senator PURTELL. I want to say this, Mr. Chairman, that I have a great sympathy with, and a great respect for, this Commission. I know of no Commission faced with so many perplexing problems as this Commission is. And I am delighted to know, and hopeful with you, that this crash program will bring the results. I can think of nothing, in my opinion, that would probably help more to solve the problem, if it is successful. But there is an awfully big "if" there. What bothers me is what will happen in the meantime.

But I do think that your crash program is an excellent idea, and I hope that it is realized. But I think—my own thinking, sir, is that it is going to be quite a while before it is realized. In the meantime, I am very much concerned with what will happen.

Senator SMATHERS. May I ask a question right along that line: What is the Commission actually doing, specifically, with respect to helping bring about these improvements in UHF? What is it that you can do, what is it that Congress can do? What specifically can be done?

Mr. McCONNAUGHEY. I think I made the statement that the Commission, what it can do will have to depend upon the comments that it gets from this rulemaking proceeding. Then I think we can figure what we can do, and we can come to you folks and tell you what we think should be done in order to assist.

Senator SMATHERS. In other words, it looks like we appropriate considerable money for research and development in all kinds of fields, munitions fields, things of that nature.

Mr. McCONNAUGHEY. Yes.

Senator SMATHERS. It might be that you people would ask us for some assistance for these various companies that might enter into research in this particular field of improving UHF?

Mr. McCONNAUGHEY. Absolutely.

Senator SMATHERS. Something of that nature?

Mr. McCONNAUGHEY. Absolutely.

Senator SMATHERS. Up to this point you have not decided specically what recommendation you are going to make?

Mr. MCCONNAUGHEY. No, sir. We are going to have to wait to get our comments from this rulemaking proceeding.

Senator SMATHERS. Have you gone far enough in your thinking to determine whether or not, if you decided that you were going to adopt this program of an all-UHF service all over the country, would you give any extra consideration to those operators of VHF stations who might be making applications for UHF stations, or things of that nature? Have you gone that far in your thinking yet? Probably you haven't; I just wondered.

Mr. MCCONNAUGHEY. No.

Senator SMATHERS. All right, Senator, do you want to ask a question?

Senator WOFFORD. Yes; I would like to ask a question. Mr. McConnaughey—I believe that is correct, isn't it?

Mr. MCCONNAUGHEY. Yes, sir.

Senator WOFFORD. You used the words "expect in the foreseeable future." Can you give us any more definite idea than just the general phrase "foreseeable future" as to this possible development?

Mr. MCCONNAUGHEY. No, I don't believe so, sir.

Senator WOFFORD. In other words, you have no idea how many years that you can anticipate it would take for the scientific development to make UHF truly equal to VHF, do you?

Mr. MCCONNAUGHEY. I certainly do not, no, sir. That depends upon the developments, Senator.

Senator WOFFORD. Certainly at the present time to do it all at once certainly would not give the coverage that you presently have, would it?

Mr. MCCONNAUGHEY. Oh, no.

Senator WOFFORD. That is not your contemplation, is it?

Mr. MCCONNAUGHEY. No; heavens no. There is one thing I want to make very clear. This Commission, in my opinion—I am speaking for myself and I am quite sure I am speaking for the whole Commission—are not going to do anything, Senator, that is going to take away service from the people in this country. The only thing we are interested in is the public. We are not interested in this station owner or that station owner, or this individual or that individual; we are only interested in the public. That is what we are charged with, that responsibility, and we are not going to take away service from the public.

Senator WOFFORD. In that connection may I ask you: Even at the present time, with the developments we now have in UHF, at best you have at the present time a spotty coverage—even, in some cities, on different sides of the streets you can get a signal plain and on the other side you can't; isn't that true?

Mr. MCCONNAUGHEY. That is true in some places. However, take in the Fort Wayne, Ind., area, where it is all-UHF—and very fine coverage and no complaints and very fine picture—and they are doing an excellent job; Youngstown, Ohio, my state, which is all-UHF, they are doing an excellent job.

Senator WOFFORD. Wouldn't you have the same situation where you had only VHF, and you are getting fine coverage?

Mr. McCONNAUGHEY. Same situation where? Oh, yes, and you get better coverage with the V.

Senator WOFFORD. There is no question about that.

Mr. McCONNAUGHEY. There isn't any question about that.

Senator WOFFORD. You want to change it to make it all, eventually, UHF—that is what the intention of the Commission is at the present time?

Mr. McCONNAUGHEY. If the developments come.

Senator WOFFORD. Yes.

Mr. McCONNAUGHEY. If the receivers are developed, the antennas and the transmitters—if they develop them sufficiently so you and I, as people sitting in our living room, can get an adequate picture.

Senator WOFFORD. Yes. Now, certainly during the period of time when you would change over you would not deprive any present listeners—viewers, rather—and listeners of the TV programs that they are getting?

Mr. McCONNAUGHEY. No, sir; no, sir.

Senator WOFFORD. Now let me ask you just one further question, sir: Has the Commission taken into consideration fully the interests of the public in this matter?

Mr. McCONNAUGHEY. I think that has been the principal thing that the Commission has done, is to take into consideration the interest of the public. That has been the primary thing they have done.

Senator WOFFORD. Have you made any survey, or has any survey been attempted, to determine the public's view? You see, after all, they have a terrific investment in these television sets.

Mr. McCONNAUGHEY. You mean the public's view. What do you mean?

Senator WOFFORD. With reference to the public's ideas and views on the changes that you all contemplate—you realize that they have a terrific investment in television sets?

Mr. McCONNAUGHEY. Yes; I see what you are talking about.

Senator WOFFORD. That would be worn out by the time you get through. But some people have to use kind of wornout television sets. Or else they would have to convert; wouldn't they?

Mr. McCONNAUGHEY. As I said before you came in, sir, what is contemplated would be an ample period of time for an amortization period to exist, where they would operate on both V and U, and an ample period of time would be given for the receiver sets to be amortized completely.

Senator WOFFORD. Yes. The receiver sets.

Mr. McCONNAUGHEY. Yes.

Senator WOFFORD. To be amortized in the home.

Mr. McCONNAUGHEY. You understand what I mean, that they do replace them.

Senator WOFFORD. Oh, yes——

Mr. McCONNAUGHEY. They do replace them after a period of 4 or 5 years.

Senator WOFFORD. Mostly on credit——

Mr. McCONNAUGHEY. I don't know about that. I expect so, maybe.

Senator WOFFORD. So that the point I am getting at is that the man who has the television set now, that can only receive VHF, if you put a UHF in over that, he has got to either convert or buy a new television set; hasn't he?

Mr. McCONNAUGHEY. That is right.

Senator WOFFORD. That is of a great deal of interest to the public generally; isn't it? Have you ever taken that into consideration?

Mr. McCONNAUGHEY. Oh, yes. Yes, sir; that is the reason we are going to allow for this amortization period.

Senator WOFFORD. That is with reference to the television stations themselves. I am talking about the man who owns the set.

Mr. McCONNAUGHEY. I am talking about the receivers, too. I mean not amortization from the standpoint—well, useful life is a better word.

Senator WOFFORD. Useful life.

Mr. McCONNAUGHEY. Yes; that is a better word.

Mr. COX. Your understanding is that during this transition period, in the normal replacement cycle for these sets, the public would be turning over their present equipment, and that under the impact of this program, plus possibly legislative assistance from the Congress, the only sets available for them to buy at that time would be all-channel sets?

Mr. McCONNAUGHEY. That is correct.

Mr. COX. So that they would, in the normal course of replacement and at no added expense to themselves, be in a position to receive the UHF signals?

Mr. McCONNAUGHEY. That is correct.

Senator WOFFORD. May I finish my inquiry?

Senator PURTELL. Would you yield to me for a moment, Senator?

You say the only set they would be able to buy. May I inquire: Do we intend to try to pass a law saying they can only buy all-channel sets at that point? Have we any guaranty that the manufacturer will supply only all-channel sets? I don't know that we have, at that time or at any other time. If you have islands of V stations around the country, you are going to ask the people then to convert when they are getting pretty good reception with a V? I think you have a problem there.

Now I want to make it clear that I think you fellows are trying to solve a problem that, in my opinion, as I said before, is probably as complex a problem as ever came before any commission. And I have great admiration for the way in which you are going about it. I don't agree with some of your conclusions and I intend to state so. But I certainly think you are trying to find the answer. However, in finding that answer, I hope we are not going to hurt a lot of people simply because an easier answer appears to be available.

But I do inquire again: What assurance have we got, where we have all these islands of V's which will be the result of any deintermixture, what right do we have to expect that those people have to buy all-channel sets during this period of transition that you speak about, Mr. Chairman? You have V and you have ultra; and you are going to have them simultaneously broadcast, is that right—if this crash program develops successfully; is that right?

Mr. McCONNAUGHEY. That is right.

Senator PURTELL. Are we going to say to those people who have V sets—take an area with all V—are we going to say to these people: You must buy at the end of 2 years or 3 years, or whatever the period is—in the meantime you will get simultaneously ultra and V transmission—but at the end of that time you are going to have to buy ultra receiving apparatus? Are we going to say that?

Mr. McCONNAUGHEY. Yes.

Senator PURTELL. Aren't we then in the process of building up a tremendous resistance toward that movement by setting up these islands of V's?

Mr. McCONNAUGHEY. I don't think so; I say, I don't believe so, Senator. I think, if given a proper period of time, and if the developments come along properly, I don't think we are going to build up any resistance. I can assure you that, as far as I am concerned, I don't propose to be a party to doing anything that is going to actually injure the public.

Senator PURTELL. I am sure of that; I am sure of that.

Mr. McCONNAUGHEY. And I think that if the developments come along, this thing can move to the UHF gradually, slowly in this country. If they get the proper coverage, they are going to get more channels, have more local programing; it is going to inure to the benefit of the public. In other words, in my little State of Ohio, where you have only got Cleveland, Columbus, Cincinnati, Dayton, Toledo, Youngstown, and Akron, and you have got cities like Mansfield, Portsmouth, Warren—I can go on and on and on, cities of 40,000 to 75,000, with no possibility of having their own local outlet—to me we are going to have to do something, this country, to utilize those 70 U channels to let local expression come into existence; and I know of no other way to do it than by the development of UHF. I think the public is going to benefit. I think the public is—they are going to be the beneficiaries. There will be a period of time when, as the development occurs, there will be come people that would have a set that might have to replace it after 3 or 4 years, or convert it and spend $20 to convert it. To me that is not a very serious problem when you think of the overall possibilities of the development of the UHF sphere.

Senator PURTELL. That is the very problem that we are faced with now, where people won't convert, where they have ultra high and very high. Isn't that one of the problems facing your Commission?

Mr. McCONNAUGHEY. It sure is. And one of the reasons is that the converters haven't been so good. They haven't had good experience with the converters in an awful lot of instances. I can understand why.

Another is this: It is human nature, I guess—we talk about competitive system and as many outlets as we can have—but it is a peculiar thing that people convert and then the converter goes bad, but they can still get one station, and they won't even have it fixed. In other words, people seem to just go along and follow the lines of least resistance.

All I am trying to point out is that the converters, like a great deal of this situation, have not been developed to where they are doing a very good job.

Senator PURTELL. I want to say I am imposing upon my colleague from South Carolina. He was asking questions and I asked him to yield. So I appreciate it. I appreciate your yielding.

Senator SMATHERS. The Senator from South Carolina.

Senator WOFFORD. That is the very point I was getting at, or attempting to. I will go back to my original question. Has any poll been made of the public, or any attempt, as to their desires in the matter?

Mr. McCONNAUGHEY. No, Senator Wofford. There was no poll taken of the public. It is a strange thing. We go through all these investigations up here on the Hill, all these appearances, and I pointed out before we are interested in the public, and the public hasn't screamed. It is UHF operator who is unhappy, or somebody unhappy about a network operation or monopoly, or this, that, and the other thing. The public hasn't been screaming. The public frequently does not scream, but I think we owe an obligation——

Senator WOFFORD. Do you mean—may I interrupt? Do you mean by screaming coming up here before this committee and testifying? How many people do you think from South Carolina have the money to come to Washington and present their case?

Mr. McCONNAUGHEY. No; I meant letters to us, complaints of any description, letters of any kind to the Commission. We get very few complaints about anything in this sphere. But I think we owe an obligation—an aggressive obligation—to the public to give them, if it is possible, the utilization of a broader service in this country. I think we owe that obligation. I think that is the reason we were established by Congress.

Senator WOFFORD. You spoke of $20. Do you know how you can put up a converter and an antenna for $20?

Mr. McCONNAUGHEY. Not an antenna.

Senator WOFFORD. You have to put an antenna up, too?

Mr. McCONNAUGHEY. In most cases.

Senator WOFFORD. And even if you have a perfect converter—and I have never seen or heard of one—it would cost you more money than that, wouldn't it?

Mr. McCONNAUGHEY. That is right, if you start with the antenna.

Senator WOFFORD. About $75 or $80?

Mr. McCONAUGHEY. In some places. I have talked to people; they say they do it for $45, $60, some of them $70.

Senator WOFFORD. That is not counting getting back to repair it often, too, isn't it?

Mr. McCONNAUGHEY. Yes.

Senator SMATHERS. Mr. Chairman, isn't, as I understand it, what the purpose is, by converting to all-UHF channels, is to make it possible so that more people, whether they live in a big city or whether they live in a small city, would have the opportunity of enjoying television?

Mr. McCONNAUGHEY. And local expression, sir.

Senator SMATHERS. To use all of the channels which are available—and obviously there being more UHF channels than there are VHF channels, then you believe there would be a better service, and that overall the people would generally be better served; is that not the purpose of this whole thing?

Mr. McCONNAUGHEY. I don't think there is any doubt about that.

Senator SMATHERS. So that what I am trying to get at, where some people in the cities who already have VHF sets—and they may not like it particularly—it is like anything else, you give way in some respects to what is the overall need? That seems to be the general policy of the Congress in the country all the way through.

Mr. McCONNAUGHEY. I think so.

Senator PURTELL. Except, of course, we must make this exception at the present moment, that our research hasn't developed the fact, as yet, that this is the answer, and it will not until we have completed the research; isn't that correct?

Mr. McCONNAUGHEY. That is correct.

Senator SMATHERS. But the reason why you are thinking of this whole matter is for the purpose of trying to serve more of the general public.

Mr. McCONNAUGHEY. That is certainly true; that is what I have tried to say.

Senator PURTELL. Actually, if the crash program is successful, this is the way to do it, I agree with you. The only thing that bothers me, and continues to bother me, is what is going to happen to the crash program if it isn't successful. What is going to happen to those stations, or places to which stations should have been given on an equitable and fair basis, what would happen if it doesn't develop that it is successful?

Mr. COX. In connection with this crash program, Mr. McConnaughey, is it the purpose of the FCC to try to provide guidance and supervision for that, to keep it moving so that it can be accomplished as rapidly as possible?

Mr. McCONNAUGHEY. Yes; it is, Mr. Cox.

Mr. COX. I had assumed, though, that the actual research and the actual development of new and improved forms of equipment would depend largely upon the efforts of manufacturers in the field?

Mr. McCONNAUGHEY. That is correct.

Mr. COX. And it is hoped, through these comments that you are going to receive in this proceeding you have instituted, that the industry generally will make suggestions as to how this can best be channeled for the development of this U equipment.

Mr. McCONNAUGHEY. Yes; and I think I would go further than that: I feel that the Commission must become aggressive and ask the manufacturers to set up an organization—or a group, or however, they care to do it—and let the Commission help and assist, if it is possible, and the Commission kind of take the leadership in this matter.

That is not in any order; that is not something that I have discussed with the Commission; that is just my own personal opinion that I think the Commission should become very aggressive and attempt to do everything to encourage the several people to expedite the crash program.

Mr. COX. Won't this have a kind of cumulative effect? That is, as it appears that the chances of working out some kind of all-UHF service are increasing, that then it becomes to the self-interest of the manufacturers to as rapidly as possible develop equipment which will make them competitive with others in the field.

Mr. McCONNAUGHEY. There isn't any question about that. I think we all recognize the manufacturer's position. He is manufacturing the VHF sets today; he is in business to make a profit, thank goodness.

But I think that as they see this direction that the Commission is moving—and I think they already feel that—as they see the direction we are moving in, it is going to encourage them to expedite the development of the UHF.

I think they are very cognizant of it. I think they are extremely cognizant of it.

Mr. Cox. Is it possible, even with real improvement in UHF equipment, that there may be some areas or some conditions of terrain and so on where VHF will still have to be employed in order to provide the present quality of service?

Mr. McConnaughey. I think so. I say I believe so; I believe that is correct.

Mr. Cox. Would this be more likely to be in areas of sparser population, where there are greater intervals between the cities which would be capable of supporting a television service?

Mr. McConnaughey. I think you could say in certain sections outside of zone I—when you get into the western part of the United States, where your distances are great, your communities are extremely small—that the V may always have to be utilized in those wide comerage areas.

Mr. Cox. But you have found, have you not, generally that in that area you don't have the same problem? In other words, the VHF channels there provide an adequate service?

Mr. McConnaughey. Yes; and we have quite a number of them in the western part of the United States.

Mr. Cox. Now, it is basic to your approach, is it not, that while you're implementing this shift to all UHF—if and when it appears that the technical improvement is coming along in a satisfactory fashion—that meanwhile you are going to try to improve opportunities for effective competition among a greater number of stations?

Mr. McConnaughey. That is right; I say that is correct.

Mr. Cox. And you propose to do this through this program of selective deintermixture?

Mr. McConnaughey. Through the interim program that we have proposed here.

Mr. Cox. And this has the dual characteristic you point out in your report of deleting certain V channels in some areas and then either making use of those in other areas or dropping in additional V's where, under your new rules as to separation from transmitter sites, it is possible to do so.

Mr. McConnaughey. That is a proposal which is made in the rule-making proceedings, for which we will await comments.

Mr. Cox. Yes. To get this under way you have instituted rule-making proceedings to accomplish proposed allocation changes in 13 areas.

Mr. McConnaughey. To date, that is correct.

Mr. Cox. Yes. Now, you have some other proposals for deintermixture which are already before the Commission, have you not, which are in a position to be disposed of; and in fact, the Commission acted on some since issuing this report.

Mr. McConnaughey. That is correct; I say that is correct, Mr. Cox.

Mr. Cox. And you have indicated, have you not, that you will entertain additional petitions for deintermixture if parties come to you and say that they feel that there is another area in which in this interim deintermixture would help to preserve UHF and to promote UHF service?

Mr. McConnaughey. That certainly is true.

Senator PURTELL. I would like to ask a question along that line.

Senator SMATHERS. All right, sir.

Senator PURTELL. On this question of deintermixture, is it done to provide a better competitive position always? And if it is, on what do you predicate the criteria that you establish for that? Is it usual—Mr. Chairman, what I am getting at, is it usually in those areas where the people have resisted conversion to ultra high.

Mr. McCONNAUGHEY. No, no. Again, I can't speak for the whole Commission. I think what was attempted to be done was where the UHF was assigned and in operation, generally speaking, and the V assignment had been made but was not on the air, that generally speaking there was a rulemaking proceeding put out looking toward that being an all-UHF area, such as Fort Wayne and such as Youngstown, Ohio; but bearing in mind, Senator Purtell, that when the comments come in, we must be cognizant of the service that is going to be given. If people are going to lose service, that is one thing. If they are not——

Senator PURTELL. Or be denied service?

Mr. McCONNAUGHEY. Or be denied service; yes. And I think, to be perfectly frank about it, I think that—I don't think, I know—it is a tremendous boon to the UHF, to the development of UHF.

Senator PURTELL. This is all part of the ultimate pattern, as I understand it, from the report. This is all part of an ultimate pattern that will fit into this complete deintermixture of, let's say, areas east of the Mississippi, if—and again, it is a big "if," and I stress it, because in my mind it is—if this crash program is successful. But Mr. Chairman, in the meantime, if it isn't successful—and we have no reason to believe—any more reason to believe that it will be than it won't be, we just don't know—will it not be true then that certain parts of the country in which deintermixture has been established, that those places will be denied a V channel—bearing in mind what the act said "equitable and fair"—will they not be denied forever a V channel because they have already been denied it on the basis that ultimately we are going to make ultrahigh everything east of the Mississippi?

Mr. McCONNAUGHEY. You mean that it would all be——

Senator PURTELL. Let's take a city——

Mr. McCONNAUGHEY. I don't understand.

Senator PURTELL. Maybe I wasn't clear. Let's take a city that has had an assignment of a V channel.

Mr. McCONNAUGHEY. Yes.

Senator PURTELL. And the Commission decides that they will deny that application, if it is an application, on the basis that they are making it all ultrahigh, and also on the basis that ultimately you hope to have all ultra and this is one step toward it, which if you ultimately accomplish your purpose would probably be—would be a step forward.

But in the meantime that V channel is assigned elsewhere. Now, the crash program doesn't work out successfully—and I hope it does, but I have no assurance it will. Then isn't that particular area forever denied that V station, or channel, because you have taken and assigned it elsewhere? Can they come back and say to you: "Well, gentlemen, your crash program didn't work out and now we would like that V that we are entitled to."

Mr. McCONNAUGHEY. Well, I see what you are talking about all right. [Laughter.] I get what you are talking about.

Senator PURTELL. I can assure you, sir, that it is just simply those questions that come up that I would like you to answer.

Mr. McCONNAUGHEY. And I think I can answer it; I say I think I can answer it, Senator Purtell. I don't think that that will present any problem because you can still move V's if it is necessary. In other words, there would be nothing—let's take a theoretical case. You must have in mind Hartford, Conn.

Senator PURTELL. I do. [Laughter.]

Let me make this clear, Mr. Chairman, because I think this is important——

Mr. McCONNAUGHEY. I know it.

Senator PURTELL. I am from Connecticut, and obviously I am interested in Hartford, but I am more interested in the whole country.

Mr. McCONNAUGHEY. I know you are, sir, I know you are. But what I was going to say is because of Hartford—to answer your question—it would not be impossible or too difficult to move a V channel from someplace else to Hartford; New York City, I will take as an example, where there are seven of them. I just give that as an example.

Senator PURTELL. Yes.

Mr. McCONNAUGHEY. In other words, I don't—in my judgment I don't think there would be any problem with reference to giving a given place, where a V would be taken out of, giving that place proper protection.

Senator PURTELL. Aren't we multiplying our problems in the event the crash program doesn't work out, then?

Mr. McCONNAUGHEY. I don't think so.

Senator PURTELL. If we don't, then, Mr. Chairman, it would appear to me the only answer is that they would be forever denied a V.

Senator SMATHERS. May I ask a question which I am not clear on, if the Senator will excuse me. Does the Commission now have a rule that while they are considering this so-called crash program they are no longer going to grant any application for V channels, which may have already been allocated?

Senator PURTELL. They are granting the application—making a grant—but withholding the construction until such time as they decide whether to deintermix a certain place.

Senator SMATHERS. Let me just put it one other way——

Mr. McCONNAUGHEY. We are not holding up any other V's.

Senator SMATHERS. If I get it completely clear, you mean in an area—take Hartford, Conn., for example—I don't know what situation is there; maybe there has been an allocation, or there has been a determination that there is a V channel available.

Mr. McCONNAUGHEY. That is correct.

Senator SMATHERS. Now, there is Mr. A, Mr. B, and Mr. C who are applying for that V channel.

Mr. McCONNAUGHEY. That is correct, and we are going to give it to Mr. A, Mr. B, or Mr. C.

Senator SMATHERS. Mr. A, Mr. B, or Mr. C will get it in the determination of the Commission as to which one will render the best public service.

Mr. McCONNAUGHEY. Yes, sir.

Senator SMATHERS. Do you withhold, however, the construction permit?

Mr. McCONNAUGHEY. That is right, until we finish rulemaking.

Senator SMATHERS. Until such time as you finish rulemaking.

Mr. McCONNAUGHEY. Which is going to be very soon. In that city, which is going to be very soon.

Senator PURTELL. You take each city, that particular city; is that right, instead of the whole picture?

Mr. McCONNAUGHEY. Yes.

Senator SMATHERS. That is what I am trying to get. In other words, we should, in our mind, distinguish what you are talking about, this overall crash program, from a deintermixture in a particular area.

Mr. McCONNAUGHEY. Yes, sir.

Senator SMATHERS. And where you have under consideration deintermixture in a particular area, you will then hold up the construction permit until a determination is made as to whether or not that specific area should be all UHF or VHF?

Mr. McCONNAUGHEY. Yes; we have already done it, in Peoria, Ill., for example.

Senator SMATHERS. But this whole general program of making everything UHF, you are not going to hold up construction permits for VHF channels——

Mr. McCONNAUGHEY. No, no.

Senator SMATHERS. Until that matter has been decided?

Mr. McCONNAUGHEY. No, no, no, no.

Senator SMATHERS. I think we have maybe gotten a little bit crossed.

Mr. McCONNAUGHEY. We certainly are not. We are not putting any freeze on.

Senator SMATHERS. Until you decide, you are going ahead as you have been in the past.

Mr. McCONNAUGHEY. That is right, except in the individual places where we proposed deintermixture. We are making grants—for example, Peoria, we did a week ago: we made a grant to Mr. A, who was the preferred individual—no construction to begin until we decide whether Peoria should be, after this rulemaking upon which comments are to be filed by October 1 or September 10, I don't know, one of those two dates—September 10 is the date——

Senator SMATHERS. But the only question to be yet decided in that particular area is whether or not that specific area, limited as it is, is to be deintermixed; is that right? All UHF——

Mr. McCONNAUGHEY. That is right. In other words, in that case whether you move the V to Davenport.

Senator SMATHERS. Is that the same situation that obtains in Hartford, Conn.?

Mr. McCONNAUGHEY. Exactly.

Senator PURTELL. But isn't this all part of a picture, Mr. Chairman, that you hope will fit into this ultimate by making all of large areas, such as east of the Mississippi, ultra?

Mr. McCONNAUGHEY. No; I couldn't say that it is part of the whole picture. Well, part of it from the standpoint that it is an encouragement to the UHF, to the development of UHF. I think to me it comes down to this: As I said, we have areas in this country where UHF is doing an excellent job, and the public is not suffering from any standpoint. If we can have enough areas, added areas, that can have the UHF—let's take your section up there at Hartford for a minute. I believe that there are applications for NBC and CBS to own the UHF stations up there.

Senator PURTELL. I have read that.

Mr. McCONNAUGHEY. All right. The people in that area—if that comes about, that they get the two UHF stations up there—will certainly not lack for fine programing; will they?

Senator PURTELL. Those that get it?

Mr. McCONNAUGHEY. Yes.

Senator PURTELL. That is right.

Mr. McCONNAUGHEY. That is right.

Senator PURTELL. Those that get it.

Mr. McCONNAUGHEY. I mean the people that will get excellent programing.

So I don't think—I think this: That when the rulemaking answers come in, the Federal Communications—I will go back to my original statement—is not going to let any of the public suffer from want of service. That is the only thing that you, sir, are actually interested in.

Senator PURTELL. That is right. But that takes in all of the public in the area served.

Mr. McCONNAUGHEY. That is right; that is right, that they have adequate service.

Senator PURTELL. You wouldn't tie in, however, would you, Mr. Chairman—I am sure that you wouldn't, at least I have every reason to believe, from your statements and from your actions, that you wouldn't—tie in the idea that simply because there were 2 ultrahigh's up there that carried the 2 big networks that that was sufficient for the people there?

Mr. McCONNAUGHEY. No, no.

Senator PURTELL. There may well be a public service to be rendered by either an ultra or a V that is necessary at the local level for the people.

Mr. McCONNAUGHEY. As a matter of fact, I think it is very essential to the people, I think very essential to the people.

Senator PURTELL. The reason I mention that it because you did mention about the reports and—and you would know, I don't—that NBC and CBS wish to, or indicated a desire to, or have contracted to buy stations up there.

Mr. McCONNAUGHEY. They have contracted to buy them.

Senator PURTELL. All right. If they have contracted to buy those stations, then certainly the fact that those two stations up there, which are ultrahigh and, therefore, could give NBC and CBS program would not be a determining factor in what else should go in there.

Mr. McCONNAUGHEY. Oh, no, I should say not.

Senator PURTELL. I thought we ought to clear it up because of your reply.

Mr. McCONNAUGHEY. You are right; I say you are right.

Senator PURTELL. Is it a correct statement to say that the Commission intends to proceed, under their present rules, in granting applications and starting television stations, as they have in the past, until such time—we don't know when it will be, but in the indefinite future—a final determination has been made with respect to this whole program of deintermixture throughout the country. Is that a correct statement?

Mr. McCONNAUGHEY. That is correct, Senator.

Mr. Cox. Isn't it true, Mr. McConnaughey, wherever you have proposed deletion of a VHF channel in a selected area of deintermixture you would substitute a UHF channel, so that an additional station to those already on the air in the community would be available for service to the public?

Mr. McCONNAUGHEY. My answer to that is, "One or more."

Mr. Cox. Due to the greater number of the UHF stations, if it later developed there was a possibility of these communities supporting a fourth or fifth station, there is more room for expansion in the UHF than in VHF?

Mr. McCONNAUGHEY. That is correct, sir.

Senator PURTELL. Along that line, I didn't think we were going to get into so extensive a questioning here. We have a meeting at 2:30 this afternoon where a report will be distributed. I have some questions that have not been answered—not because the answers have been denied, but because I haven't sought them.

Since we want to preserve ultra high, what about the fellows that are suffering—ultra-high operations—surrounding areas such as New York, where there are all V's? We have a situation in Bridgeport—I am mentioning it as an example; I don't think, however, what happens to any one particular area shouldn't enter, and I am sure doesn't enter into either the consideration of your committee or ours. But here we have places where ultra's are not able to survive because V's are covering the area in which they are established. What are we doing to help those fellows? There is a question where your U's are apparently dying on the vine, and we are talking about trying to bolster the U's up.

Mr. McCONNAUGHEY. That is right; that is right. Well, I think you have to go back. They went into business. This is an open, free competitive enterprise business. This isn't a regulated public utility. The Commission doesn't guarantee—and the Congress doesn't guarantee—anybody going into business that they are going to make money. I can own a gas station here, you can own one over here; you make money and I don't. But, nothing can be done to guarantee the man at Bridgeport that he is going to make money. We can't do that.

Senator PURTELL. I am sorry that we have selected—I had to select it to indicate the area that I was talking about. But I want to say this, that we are talking now about competitive—in your deliberations you used the word "competitive" situation. And here is a competitive situation.

Mr. McCONNAUGHEY. That is the reason for the long-range program. If they had comparable facilities at Bridgeport—let's not take an individual, but let's take Bridgeport—if you had the UHF, all UHF, if it was all UHF, we will say, then it appears to us that places like Bridgeport and like Mansfield, Ohio, and like any number of places, could have their own television stations where the people in those communities would have their own local programing, which is the most desirable thing in the world to me.

Senator PURTELL. What I am trying to point out, Mr. Chairman, is that your efforts to preserve ultra high have been evidenced by your desire, for instance, to make certain areas all ultra high.

Now, we are talking about preserving ultra high stations. Well, here are groups of stations that are surrounding the larger cities where there are all V's that are not being preserved, apparently, because they are going to die. I would think they can't stand this strain long, from what I have heard—financial strain.

Mr. MCCONNAUGHEY. There is nothing anybody can do to preserve them, except eventually go to UHF.

Mr. COX. Would the Commission—during this interim period when it is considering these allocations changes pending decision whether they can go to all UHF—consider a proposal from such an overshadowed area—Bridgeport or Akron, Ohio, or any other area with UHF stations operating under the shadow of multiple V services in a larger center—would they consider an application from the operator of that station for the dropping-in of a low-powered V, which at least would get him away from the problem of set incompatability and would permit him to provide a local service if he can provide programs which will attract viewers?

Mr. MCCONNAUGHEY. No, I don't think so. You get into that and you meet yourself coming home. You start squeezing in and you get beyond me there, beyond you and me both. You get into this engineering proposition. You get into squeeze-ins, and you start squeezing in a low-powered V here, squeezing out a U over here. You are just running around in a set circle. I don't think the Commission has come to a place yet where they look with very much favor upon that type of an operation. I am not saying they wouldn't do it, if it is feasible engineeringwise, if it can be done. But I say that it presents a lot of problems, Mr. Cox.

Mr. COX. I was asking about this restricted largely to this area of a smaller community overshadowed by VHF service from a larger community. Now, since you are not proposing to deintermix New York at this stage—you are waiting to see whether this will ever be feasible—for the next few years the area of western Connecticut is going to be blanketed with VHF signals, and that has led to a condition where the operator in Bridgeport cannot get people to convert their sets because they have ample program choices.

Now my question was whether, simply in those situations, if the operator came in with an engineering report which said that he could place a V channel in here, at such and such a power and antenna height, and it would not cause interference with existing VHF stations, whether that might be considered as an interim measure while the Commission is trying to work out the shift to all UHF.

Mr. MCCONNAUGHEY. I think it certainly would be considered.

Senator PURTELL. I think this is important. We are talking about western Connecticut. I want to make it clear that these conditions, I don't think, are peculiar to any one area of the country. I think they are all over the country and we have simply cited these, or they have been cited as illustrative of a situation. Now, what they are trying to find out is not only what might happen to western Connecticut or eastern Connecticut, but we are trying to find out what will happen to all like areas in the country.

Mr. Cox. What happens at Everett, Wash., for example.

Senator PURTELL. This situation isn't peculiar at all to the area around New York, by all means.

Mr. McCONNAUGHEY. It is much more accentuated because of seven stations in New York.

Senator PURTELL. That is correct. But it is also true in many other large areas where you have only V's.

Mr. McCONNAUGHEY. That is correct.

Senator SMATHERS. Does the Commission have any policy or precedent, we might say, where, for example, a new drop-in channel is found, or one has been gotten maybe by the engineer of some UHF man, does the Commission, as a precedent, give more weight to that UHF application for the new channel, than they do just new people who come in, or do they not? Or haven't you made a determination on that? I am not trying to get anything on the record——

[Laughter.]

Mr. McCONNAUGHEY. Let me try to answer it this way: His experience is going to be of substantial benefit to him.

Senator SMATHERS. That satisfies me. Let's move on, Mr. Cox.

Mr. Cox. You indicated, Mr. McConnaughey, that you thought that action would be taken quite soon in these deintermixture proceedings—that is, in other words, you have called for comments by September 10 and reply comments by September 25. Could you give us any estimate as to the time thereafter when decisions might be reached in this first group, at least?

Mr. McCONNAUGHEY. No. All I can say is just we are going to expedite it just as fast as we possible can.

Mr. Cox. Do you feel that if this interim program is to be successful that there is going to have to be a fairly substantial number of markets which are deintermixed, and not just a token few?

Mr. McCONNAUGHEY. Well, as many as the Commission thinks is feasible and possible.

Mr. Cox. Now in this deintermixture proceeding, is this a correct statement: Let's take Peoria, where there are two UHF stations, I believe, on the air, and a V allocated which you recently granted, but stayed the construction of the station. Now, if it is finally decided to deintermix Peoria, and to place the third U in there instead of a V, this will be after the Commission has determined that this action is not going to result in depriving anyone of service—of at least a first television service.

Mr. McCONNAUGHEY. That is certainly true.

Mr. Cox. Now, do you feel, generally, that where a VHF channel is deleted from one community, it should be assigned to another community, having a predominantly VHF service, where it can be fitted in with the Commission's existing engineering standards?

Mr. McCONNAUGHEY. Basically I feel that; yes, sir. I don't think it should go to waste, in a predominantly V area.

Mr. Cox. So that it provides greater possibilities for competition both in any all-U area and in an area where the V can be fitted in?

Mr. McCONNAUGHEY. Yes, sir.

Senator PURTELL. Let's fit this into an overall pattern. We are hoping to get ultimately—with the crash program successful, assuming it will be, and I am not ready to assume that—but just for the sake of pointing up what I wish to say, you have got these areas that you have established only V's by transferring V's from one area to another, making all ultras and all V's. Aren't we again making it even more difficult to become all ultra, if and when this crash program proves successful? Because we are building up these islands, all over, of V stations, in which only V——

Mr. McCONNAUGHEY. No, no.

Senator PURTELL. You don't mind if I finish, please?

Mr. McCONNAUGHEY. I am awfully sorry.

Senator PURTELL. Where we build up only V stations and the receivers necessary therein are only V's. Take this city right here, we only get V's. Now, as an example, I live in Hartford, as you already know, and we up there went from very to ultra, so I had to change. I had to buy an ultra set. I moved my V set down here. Why? Because it would have been foolish for me to invest in an ultra high V set down here when I could use, for every purpose available to me on television, a V receiver. So I have used it.

Now we are building up these areas, therefore, in which people only have V's, and in which your senders will only be V stations. And aren't we multiplying the problems that you are going to be confronted with? We are in fact preventing, to that extent, intermixture.

Mr. McCONNAUGHEY. I feel, Senator, when you speak of moving a V—we will say from Peoria, for example, where there are two U's on the air—if we would move that V assignment to a place where there was already all V's, everybody has the V. I don't personally think that you expand anything of any description, because you put another V in where everybody has VHF already. And in the Peoria area most of the people have UHF now, and you are just giving them another UHF service.

Senator PURTELL. What we are doing, as a matter of fact, is not encouraging the use, in those areas where you only have V, of ultra high receivers.

Mr. McCONNAUGHEY. Oh, no.

Senator PURTELL. That is what we are talking about, the big plan—trying to get everybody ready to go through this transition period; isn't it?

Mr. McCONNAUGHEY. Well, that is much better, it seems to me, than letting the UHF die. It is simple—if we don't do what we propose to do here, it is going to die.

Senator PURTELL. That is correct. But I think we have to determine whether or not, in these areas in which we are talking about now, where there would be deaths of ultra——

Mr. McCONNAUGHEY. Where there would be ultra deaths?

Senator PURTELL. Yes; where they would die.

Mr. McCONNAUGHEY. That is sure.

Senator PURTELL. Just to make it ultra, because it is a nice thing to be ultra, or a V, because it is a nice thing, is, I am sure, not the way you intend to operate.

Mr. McCONNAUGHEY. You are correct.

Senator PURTELL. All right. So it is a question whether or not—there are these economic factors that apparently you are now taking into a greater extent, I would assume, than was originally—I would assume all those are weighed; are they not?

Mr. McCONNAUGHEY. They have to be.

Senator PURTELL. In the determination of whether deintermixture will take place?

Mr. McCONNAUGHEY. They have to be.

Senator PURTELL. All right.

Mr. COX. Wouldn't one other way of improving this competitive situation during this interim period be to grant as promptly as possible, the long-contested VHF channels in such major markets as Boston, St. Louis, Pittsburgh—places of that kind?

Mr. McCONNAUGHEY. Yes.

Mr. COX. Are most of those now at a point where they are awaiting decisions, or are they, some of them, still prior to argument?

Mr. McCONNAUGHEY. There are a few of them left. We have disposed of most of them.

I have never known, and I want to make this statement on the record before this committee, to whom we are primarily and basically responsible, before whom we are very happy to appear:

We have had hundreds of hours eaten up, of our staff people, during this session of Congress, by committees up here on the Hill. I am not talking about this committee, before whom we are happy to appear and whom we have a responsibility to. I point that out because it has taken the time—and when it is all computed it is going to be thousands of hours—of our important staff people who have been working day and night on getting stuff ready to get up here, and conferences, and testimony, and evidence, when they should have been working on getting out important business of this Commission. I just found that the head of my Opinions and Reviews staff, just the other night, the other day, has been working until 3 or 4 o'clock in the morning getting out these cases that you are talking about, and he is just about ready to have a nervous breakdown; and what applies to him applies to this General Counsel's staff, and right straight down the line. And if any outfit has ever worked—overworked—the staff of this Commission has done a magnificent job under very trying circumstances.

Those few cases that are left will be out of the way, I am satisfied, by the 1st of January, practically all of them. We will have nothing left.

Senator SMATHERS. Right on that point, Mr. Chairman, I think it might be advisable to have you submit for the record how much time you people, as a Commission, have spent up here on the Hill before the Congress. And I think it might be informative for the record to have an estimate, if you can get it, as to how much time your staff people have had to put in getting ready for appearances before the Congress.

Now I know that, of course, you recognize that this particular agency, as other agencies, is set up as an arm of the Congress.

Mr. McCONNAUGHEY. I sure appreciate that.

Senator SMATHERS. But we have given you a job to do, and I completely agree with you that it is a little bit nonsensical, for instance, to spend so much of your time up here that you cannot do the job. It may be that we should provide for you some more assistants, which could be done. I think if that is the case, we can do it.

As you know, however, there have been some cases in certain areas which have been pending quite a long time. They are difficult cases. As Senator Purtell has so well stated, there is probably no other agency in the Government today which has such a complex and difficult set of problems confronting them as yourself. And we appreciate that.

But if you put this matter, to support your statement that you have just made, the matter of hours that you have spent on the Hill—which again will take a little time of somebody's, but we are getting ready to go out of session—it would be very helpful.

Mr. McCONNAUGHEY. I would be happy to do that.

Senator PURTELL. Somebody told me that you are having to appear before 10 or 11 committees, is that correct? Is that a fact?

Mr. McCONNAUGHEY. There have been quite a few.

Senator SMATHERS. There might be something basically wrong in our procedure here. After all, the Interstate and Foreign Commerce Committee is supposed to have primary jurisdiction over this, and yet other committees have the right, and frequently they do want, to hear these people and yet they are pulling you and tugging you back and forth and you have to go. Now I think it would be interesting if you will get the statistical information as to how much time you have spent, what committees you appeared before this year. I think it might give us some insight where we might, in some effects, change our rules—where we could have joint committee hearings and things like that, saving everybody's time. So support your statement with some statistics and it would be helpful.

Senator PURTELL. As a matter of fact you spoke about your staff being on the verge of a nervous breakdown—I sometimes wonder why you fellows aren't on the verge.

Senator SMATHERS. In particular, what would be of interest to us is how much duplication was there. In other words, the testimony that you gave to us, was that exactly or almost the same as the testimony you gave to another committee? If it was, we might be able to work out a system to save everybody's time.

Mr. McCONNAUGHEY. I would be very happy to do that, sir. We are primarily responsible, I feel, to the Senate and House Committees on Interstate and Foreign Commerce. We are an arm of the Congress—have never had any other feeling. And I did not mean to say anything disrespectful about Congress. But it has been rather time-consuming.

Senator SMATHERS. We accept your statement as completely respectful and very informative, and it may be that we can work in a procedure which will actually let both of us do a better job. If you will get that information, it could be helpful.[1]

Mr. McCONNAUGHEY. Thank you, sir.

Mr. COX. In your report and order of June 25 you set forth some new propagation data; do you not?

Mr. McCONNAUGHLEY. Yes.

Mr. COX. Does this recognize an expanded grade B service? That is, does this now recognize a somewhat increased coverage of television stations, based on experience since the sixth report and order?

Mr. McCONNAUGHLEY. Yes; it does, Mr. Cox.

Mr. COX. Does this report—at least in connection with the pending rulemaking proceedings—require the filing of maps of computed coverage on this new basis, and on an interference-free basis?

Mr. McCONNAUGHEY. That is correct.

Mr. COX. As I understand it, however, you require them to show only cochannel, and not adjacent channel, interference.

---

[1] This information was furnished by letter dated August 30, 1956, and is printed at the conclusion of the Commission's testimony, on p. 978.

Mr. McCONNAUGHEY. That is right.

Mr. COX. The committee heard some testimony from a witness a month or so ago who was suggesting the desirability, as a general practice, of requiring the filing of maps showing completely interference-free coverage, based on such more realistic standards. Would you feel that this would be a good general policy?

Mr. McCONNAUGHEY. I would like for Mr. Cowperthwait, who is an expert in that matter, to answer that question.

Mr. COWPERTHWAIT. There are some very complicated problems associated with coverage. Actually we should go out in the field and measure, but that is almost impossible. And as a result we thought we would set up some standards which are not accurate in any particular case, but they would serve as a comparative basis, so that in any particular area we could compare the various stations in the area—try to determine what the white areas were with relation to other areas. For what it is worth, that is what we tried to do in this report.

Mr. COX. Is it possible, however—again without measuring it, but just on these computations based on the standards—to determine on an average basis what would be the probable areas of cochannel and adjacent-channel interference in any particular arrangement of stations?

Mr. COWPERTHWAIT. Yes, roughly.

Mr. COX. Roughly, subject to correction based on actual field surveys?

Mr. COWPERTHWAIT. Yes, sir.

Mr. COX. Would you feel it would be desirable, both for the purposes of the Commission and for the information of the public, if maps of that kind were required of various television stations?

Mr. COWPERTHWAIT. Yes. May I add that in this information that we are requesting we are including tables which will give us roughly the service area, taking into consideration interference.

Mr. COX. Now, there are a number of matters, Mr. McConnaughey, that I think we might touch on that relate back to the earlier testimony of the Commission when you appeared before the committee in January and February.

You reported at that time on a rulemaking which was being conducted by the Commission directed toward relaxing rules as to private intercity relays. Could you report to the committee what the present status of that proceeding is?

Mr. McCONNAUGHEY. We have that matter under consideration in the rulemaking. We have been granting these licenses, as you probably know, to permit these intercity relay facilities to be put up, generally, where they couldn't afford to have the connections with the Telephone Co.

And, as I understand from the Bureau, they should have those up for finalization before us by the time we come back here at the end of August.

Mr. COX. Fine. How about the matter, which you also touched on in your earlier testimony, of the charges for microwave and cable service of the Telephone Co.? I believe Mr. Cowgill indicated at that time that the staff was reviewing a third study of the Telephone Co.'s costs which had been prepared by the company, and that he thought there was some chance of a reasonably prompt conclusion of this proceeding which has been going on for some time.

Mr. McCONNAUGHEY. I just talked to Mr. Cowgill about it yesterday, and he tells me that these cost studies which have been made are about to the completion of analysis, and he feels that he can have those before the Commission by the time we come back.

Mr. Cox. Now, you also discussed the possible use of boosters to extend, initially, UHF service, and then, as I understand it, it was broadened to include VHF service, as well. The committee has noted, of course, that the Commission has completed its translator rulemaking proceeding, and has issued rules for authorizing a translator service in the top UHF bands.

Now, I believe, in that connection, there were some proposals filed in the form of comments, suggesting that the Commission likewise authorize VHF boosters and translators, and that in its decision the Commission did not dispose of those on the merits, but said that they would be taken care of in this pending booster proceeding. Now, could you report on the status of that proceeding?

Mr. McCONNAUGHEY. The staff tell me that they are working on that, and they will, within the next 30 to 60 days, be ready to report to the Commission.

Mr. Cox. Has the staff, in that proceeding, been considering whether it would be engineeringly possible to authorize a limited VHF booster and translator service on an interference-free basis?

Mr. McCONNAUGHEY. They say they are considering it. They say it is an extremely complicated area; that possibly in some certain places it can be done. But they are studying it, as I understand it.

Mr. Cox. As I understand it, of course, giving first attention to the translator proposal was, of course, because this permitted a completely interference-free service all by itself?

Mr. McCONNAUGHEY. That is right; that was not difficult, Mr. Cox.

Mr. Cox. I think, of course, in that connection that the reason, perhaps, for the continued consideration of these may arise from matters of cost. Now, as I recall it, the Commission indicated, when they appeared before the committee earlier in the year, that they have been advised by manufacturers that the cost of one of these translators would be approximately a thousand dollars. Now, isn't it correct that the price now being quoted by the manufacturers is in the range of $2,500 to $3,000 per channel for the translator equipment?

Mr. McCONNAUGHEY. Maybe Mr. Cowperthwait could answer that.

Mr. Cox. Yes.

Mr. COWPERTHWAIT. It all depends on how elaborate antennas are required. If the receiving antenna can be relatively simple—in other words, it has a relativley clear shot at the transmitting antenna—of course, the expense is not so great. Likewise, if the booster transmitting antenna can be a simple array, rather than a directive antenna, the costs are reduced.

I think that thousand dollars referred primarily to the transmitter itself. So that in depending upon the——

Mr. Cox. Well, I am talking now primarily about just the device which translates the received VHF signal to a high band U, which sends out this periodic signal required by your rules, which contains the automatic or remote control shutoff required by your rules; isn't that piece of equipment, in the cabinet which encloses it, quoted now on the market at $2,750 by one manufacturer, at least?

Mr. COWPERTHWAIT. I have heard that figure. I have heard others that can do it for much less.

Mr. COX. You have?

Mr. COWPERTHWAIT. Yes.

Mr. COX. That would certainly be helpful, because it seems to me that this translator proposal, while very healthy and very satisfactory in a community of sufficient size, still may leave the smaller community, where the number of sets spread over a cost of this kind might present a problem. Wouldn't that be true?

Mr. COWPERTHWAIT. Yes.

Mr. COX. Some of these areas where boosters have developed there is literally just a handful of houses.

Mr. COWPERTHWAIT. Of course if the booster is constructed on the same engineering principles as the translator, the cost would not be too greatly different.

Mr. COX. In other words, the present relatively cheap boosters that they are using would, under no circumstances, even if you developed rules for an interference-free service, be satisfactory? That is, they would have to have more elaborate equipment which would then approach in cost the figure that is now being cited in connection with translators?

Mr. COWPERTHWAIT. That is correct.

Mr. COX. You also discussed, Mr. McConnaughey, when you were here before, the use of the satellites as a means of extending service. Is it true that the stations which have been authorized to operate as satellites have been specifically authorized so to operate on a petition in which they asked that they be licensed to operate as satellites?

Mr. MCCONNAUGHEY. I think that is right; yes.

Mr. COX. Now, can a station which is licensed to be a regular program-originating station in practice enter into arrangements with other stations by which it becomes a satellite to the other stations, without the consent of the Commission?

Mr. BAKER. May I answer?

Mr. COX. Yes, sir.

Mr. BAKER. Just briefly, and that is this: When a station is licensed, it initially makes proposals for programing which contain certain local programing originations. If, after it is licensed, it should decide not to live up to those promises, of course, it can do so without consulting the Commission. That might be at the risk, however, of not being renewed ultimately. Generally speaking, that would not take place. Generaly they would come in, and at a specific time request permission so that they would not be risking having failed to live up to their promises.

Mr. COX. I see. Now, does the Commission have any definition of what constitutes a satellite, in terms of percentage of programs repeated from another station, or anything of that kind?

Mr. BAKER. I don't think the Commission has a definition of it, as it termed a satellite. What it did was it allowed grants where people did not propose to make any local programing, and they called those satellites.

Mr. COX. With, as I understand it from the Commission's testimony when they were here before, the hope that as these licenses were renewed, that they could phase into more and more of the local operation after the operation of the satellite had developed local circulation?

Mr. BAKER. That was contemplated.

Mr. COX. You indicated earlier that the Commission might take interim action on certain phases of the work of its Network Study Group if it was found possible. Have there been any situations in which the study group has developed information on which the Commission to date has taken any action?

Mr. McCONNAUGHEY. No, not as yet; no.

Mr. COX. You still expect to have the work of the study group completed next year?

Mr. McCONNAUGHEY. June 30, 1957.

Mr. COX. Has the study progressed to the point where, on any of its phases, the group is going to be holding open hearings with respect to its findings or its proposals?

Mr. McCONNAUGHEY. Where the Network Group is——

Mr. COX. Study group.

Mr. McCONNAUGHEY. Not to my knowledge.

Mr. COX. I believe when you were here before you indicated that at some stage in this proceeding there would be—in addition to the investigative type of proceedings that they were following—there would be public hearings at which there would be spread on the record material on any—at least on any contested issues.

Mr. McCONNAUGHEY. I think that that would be contemplated, yes. Nothing—no hearings have been set yet; no, sir.

Mr. COX. Nothing has been done?

Mr. McCONNAUGHEY. No, sir.

Mr. COX. You discussed when you were here, also, the policy of the Commission of continuing to renew outstanding construction permits for UHF stations, which either had never built or had been on the air and left the air.

Mr. McCONNAUGHEY. Yes, sir.

Mr. COX. As I recall it they expired yesterday. Has the Commission taken action on this matter?

Mr. McCONNAUGHEY. They have been renewed.

Mr. COX. They have been renewed. Now, the question was raised——

Senator PASTORE. On that very point, Mr. McConnaughey, we had an individual who testified here, I can't put my finger on it here——

Mr. COX. We have a letter submitted into the record on that.

Senator PASTORE. All right.

Mr. COX. The question was raised by one or more of the Senators when you were here last as to whether the Commission needed any legislation to help it with this allocations problem. Now aside from your indication a while ago that perhaps some help on the set problem might be needed—aside from that, does the Commission at this time have any suggestions for legislation which they think would be of help to them in dealing with the allocations situation?

Mr. McCONNAUGHEY. Not specific. I hope by the first—before the 1st of January that we can have some legislation prepared along that line.

Mr. COX. I think also Senator Magnuson earlier raised a similar question as to whether or not the Commission had any further suggestions, above and beyond the amendment of section 309 (c), with respect to procedural reforms which might expedite its work. Does the Commission have any such recommendations to make at this time?

Mr. McConnaughey. We will have some, sir, but I would prefer to make them when the Congress comes back in January.

Senator Pastore. How has that change worked out thus far, Mr. Chairman?

Mr. McConnaughey. Not too well.

Senator Pastore. Not too well?

Mr. McConnaughey. It has been successful in a number of cases, it is just a question of whether we went far enough.

Senator Pastore. I see.

Mr. McConnaughey. I shouldn't have answered you, sir, the way I did.

Senator Pastore. You can withdraw it.

Mr. McConnaughey. It has been of substantial help; I say it has been of substantial help. Maybe I have been a little bit disappointed because I felt it didn't go all the way.

Mr. Cox. I hesitate to ask this after your statement a moment ago about the obviously hard-pressed condition of your staff, but I wonder if it would be possible, before the date which was indicated earlier for the closing of the record, to have someone in the Broadcast Bureau prepare for the record a list of the various criteria which are considered by the Commission in comparative proceedings, and if there is any ranking of importance, a discussion of the way in which those criteria are applied?

Mr. McConnaughey. We would be very happy to do that, sir.

Mr. Cox. Now, in that connection, could you give some consideration to the question of whether or not some of these criteria are contradictory to each other? That is, in other words, you have, as I understand it, a criterion which emphasizes local ownership of the station, and on the other hand, of course, you have a criterion which emphasizes prior broadcast experience.

Mr. McConnaughey. Right.

Mr. Cox. Obviously you might, for instance, find that a multiple owner would have a very fine record of past experience, but then he would find that he is almost automatically ruled out if he is opposed by an applicant made up largely of local people. So if you could give some consideration to that——

Mr. McConnaughey. Be glad to do that.[1]

Mr. Cox. Now then as you will recall, the committee heard testimony from Mr. Henry Walker, of Evansville, Ind., with regard to the proceeding in which he and certain others were the unsuccessful applicants for channel 7. At Senator Pastore's request, we wrote to you—but rather late, because you had it, until recently, on a motion for reconsideration—asking you to comment to the statements which he made at that time. The record should, of course, show that in the interval, while you were still considering this matter, Mr. Baker did supply us with some comments on this particular case.

Does the Commission have any further comments on the suggestion made by Mr. Walker that this case was the first one in which the ownership of AM stations was apparently, in his view, held to disqualify an applicant for a TV license?

Mr. McConnaughey. Mr. Cox, the ownership of the AM stations did not disqualify the man. That is something that the Commission,

[1] The information requested was submitted in a letter dated August 30, 1956, which is printed at the conclusion of the Commission's testimony, on p. 979.

as I understand it, always takes into consideration with reference to a concentration of mass media.

As I recall, he was the loser in that Evansville case, and he had AM stations, or FM, in Evansville, Terre Haute, and as I recall, in East St. Louis, Ill., which formed a small triangle. That did not disqualify him, but that was one of the considerations which the Commission considered, as it does in many cases. Whereas it was a factor that was balanced in favor of the people who got the grant. I think that is the best way that I can describe it.

Mr. Cox. Would it be accurate to say that, aside from this issue of diversification of media of mass communication, the Commission found the applicants balanced on other factors, so that this was perhaps decisive in the case?

Mr. McConnaughey. I think that it ended up that there was no preference awarded either party on the basis of seven different criteria; that preference was awarded to this individual, who is complaining, in local programing, but the differences there were not considered major; and that he had a slight preference on local residency of stockholders. Those were the two preferences that he had.

The individuals who got the award had three preferences. They had a clear preference in the criterion of integration of ownership with management—and that is very important because that is the people who are going to run the station. And I think we look at that very carefully. Another one, a second preference, was with respect to likelihood of effectuation of television proposals. The individuals that got the grant had that. The third was diversification of media of mass communication, the one he was complaining about.

Mr. Cox. Isn't it true that the importance of the criterion of integration of ownership with management is largely that it leads you to conclude that there is greater likelihood of the effectuation of proposals?

Mr. McConnaughey. I think that would be considered along with it, I don't know.

Mr. Cox. In other words, the reason you feel it is important that the people actually in day-to-day charge of this station also have an ownership interest, is that you feel that this makes it more likely that the representations they have made to the Commission as to programing, studio plans and so on, would be carried out?

Mr. McConnaughey. I think so.

Mr. Cox. So that, therefore, these other two preferences that were given to Evansville Television more or less merged—one leads to the other?

Mr. McConnaughey. I don't know whether the Commission felt that or not. I don't know.

Senator Pastore. I would like to ask the question a lot more simply: The impression that this gentleman left with me—right or wrong, the impression definitely that he left was that this man who apparently was favored, or was on the verge of being favored, was more or less a professional applicant who had applied in several other localities before, been granted licenses, and then he sold his licenses. And then he came to this locality, where this man had already established, for a long time, radio facilities and was also an applicant; and that apparently this fellow who was a stranger to the locality was able to come in and be preferred by the Commission.

Now I thought that was rather a serious impression. I mean I like to give it to you straight, and I would like to get a straight answer. I mean it didn't sound too good the way it was presented. I am not saying what he said was exactly an accurate presentation of the facts, but that is the impression he left with us.

Here is a fellow that had already had licenses before; after he got these licenses he sold them; then he went to this locality and apparently he was in a preferred position. If a fellow could maintain that position, he could become a millionaire overnight. That is giving it to you straight. I am not asking you to give an answer now. But my goodness gracious, something ought to be cleared up on that.

Mr. McCONNAUGHEY. All I can say with reference to that case or any other case, and I can only speak for myself——

Senator PASTORE. Not any other case, that case; the impression was left on that case, Mr. Chairman. And I think the Commission owes it to itself, inasmuch as it was said publicly, to give a public explanation that it either is so or it isn't so. I am not asking you to do it today. But I think something ought to be there.

Mr. McCONNAUGHEY. We will be glad to write you a letter on the subject.

Senator PASTORE. All right, fine. I think we ought to put it in the record.[1]

Mr. McCONNAUGHEY. Yes; I say I think you should. I want it in the record.

Mr. COX. I think we can also incorporate Mr. Baker's letter of June 8, 1956, which discussed some of these items.

(The document referred to is as follows:)

FEDERAL COMMUNICATIONS COMMISSION,
Washington, D. C., June 8, 1956.

Hon. WARREN G. MAGNUSON,
Chairman, Committee on Interstate and Foreign Commerce,
United States Senate, Washington, D. C.

DEAR SENATOR MAGNUSON: Further reference is made to our correspondence concerning the Evansville case. In your May 22, 1956, letter you state that you did not receive a copy of the initial decision and the original Commission order. This material was transmitted to your office under separate cover. However, under the assumption that it may have been lost en route, I am sending that material attached to this letter. When the Commission hands down a decision on the petition for reconsideration a copy will be sent to you.

As you recognized when you previously requested my personal comments, under the separation of functions provisions of section 409 of the Communications Act, I was not able to make a presentation of any of this matter before the Commission nor was I able to consult with the Commission. Consequently the views expressed in this letter can only be termed my own personal views. With this caveat, I am submitting the following analysis.

You request my comments on the statement of Mr. Henry Walker, Jr., secretary-treasurer of On The Air, Inc., an unsuccessful applicant in the Evansville comparative proceeding at the May 15, 1956, television inquiry before your committee. This statement reads as follows:

"The Evansville case is the first decision in history in which the Commission has applied the diversification of ownership principle in denying an applicant a grant for a television station when the applicant owned radio stations only."

I have attached hereto a synopsis of the comparative conclusions of the Commission in this case. As the chart indicates, On The Air was awarded a preference on the basis of the local residency of its stockholders and a slight preference in regard to local programing. On the other hand, Evansville was awarded a clear preference in the criterion of integration of ownership with

[1] The Commission submitted its answer in a letter dated August 30, 1956, which is published at p. 971 below, immediately after the earlier letter from its General Counsel.

management, a narrow preference with respect to the likelihood of effectuating its proposals and a preference as to the diversification of the mediums of mass communications. All other relevant comparative factors were found to be substantially equal with neither party being granted preference.

As background for my analysis of the way in which the Commission selected the applicant in this case which it believed would better serve the public interest, it is necessary to note the case of *Johnston Broadcasting Company* v. *Federal Communications Commisison* (85 U. S. App. D. C. 40, 175 F. 2d 251 (1949)). There the court of appeals said: "The Commission cannot ignore a material difference between two applicants and make findings in respect to selected characteristics only. Neither can it base its conclusion upon a selection from among its findings of differences and ignore all other findings. It must take into account all the characteristics which indicate differences and reach an overall relative determination upon an evaluation of all factors, conflicting in many cases." Diversification of the mediums of mass communications, on which Evansville TV was awarded a preference, was simply one of the many comparative factors considered by the Commission. This is not to say that a permit should be withheld from an applicant because it is otherwise engaged in the dissemination of the news. But where one applicant is free of association with existing mediums of communication and the other is not the Commission, in the interest of competition and consequent diversity, may be derelict if it does not weigh this factor, along with others, and award a preference to the deserving party on the basis of it. The court of appeals in *Scripps-Howard Radio, Inc.* v. *Federal Communications Commission* (see 4 R. R. 525) stated "in considering the public interest the Commission is well within the law when in choosing between two applicants it attaches significance to the fact that one in contrast to the other is dissociated from existing mediums of mass communication in the area affected." (See also *Plains Radio Broadcasting* v. *Federal Communications Commission*, 85 U. S. App. D. C. 48, 52, 175 F. 2d 359, 363 (1949), and *Stahlman* v. *Federal Communications Commission*, 75 U. S. App. D. C. 176, 126 F. 2d 124 (1942)).

Although diversification is an important factor, it is weighed along with all other considerations to determine which of the competing applicants, if awarded the constructon permit, would better serve the public interest. Of course, being only one consideration, the diversification factor may be counterbalanced by other factors. (See *Alladin Radio and Television, Inc.*, 9 R. R. 1 (1953): *The Tampa Tribune Co.*, 9 R. R. 719 (1954)). In reference to Mr. Walker's statement, you have specifically requested:

"Can you tell me whether the Commission has ever before, in a comparative proceeding, held that a holder of an AM license should be penalized on that account, and that that factor should be controlling against such a licensee, all other things being equal? I am sure that you can advise me on this matter at this time without recourse to the members of the Commission."

Mr. Walker's statement on page 11, since it includes a number of conditions, may be fundamentally correct, but it presents an incomplete picture. Thus, in answering your question in this regard, I must point out that "all other things" were not found to be equal in the Evansville case. (See attached synopsis.) Ownership of radio stations has traditionally been a factor given weight in comparative proceedings for a construction permit for another radio or television station. Similarly, ownership of newspapers, other television stations, magazines, theaters, and, in fact, any medium of mass communication, would be taken into account by the Commission in comparing applicants. Ownership of the various mediums has been considered in a variety of combinations. Thus, it was inevitable that eventually a situation would arise that ownership of radio stations would be the significant factor which struck the balance in a television case.

Sometimes the ownership of radio stations has been counterbalanced by the ownership of other media of mass communication. (See *Radio Fort Wayne, Inc.*, 9 R. R. 1221). There have been, of course, more comparative proceedings concerning applicants for radio stations than there have been for television stations, and in many cases where radio ownership was a factor to be weighed, because of countervailing considerations, grants were awarded and not denied.

In addition, radio ownership in a comparative proceeding may have two aspects. To the extent that it demonstrates a good record of broadcast experience and likelihood of future effectuation of program proposals, it is an advantage. To the extent that it demonstrates a concentration of control of the media of mass communication, it is adverse. It cannot be said that the Commission is "penalizing" an applicant for having engaged in a certain business, but rather that the Commission is obliged to weigh all the relevant factors flowing from having been in that business, both advantageous and adverse. This is exactly what was done in the Evansville case.

I hope that this letter answers your questions fully; however, if you have any further problems in connection with this matter, do not hesitate to inquire.

Sincerely yours,

WARREN E. BAKER, *General Counsel.*

IN RE APPLICATIONS OF EVANSVILLE TELEVISION, INC., AND ON THE AIR, INC., EVANSVILLE, IND.

For Construction Permits for New Television Stations (Channel 7) Evansville, Ind.

I. INITIAL DECISION

Looked toward a grant to Evansville TV.

II. FINAL DECISION OF THE COMMISSION

The Commission considered all factors relevant in a comparative proceeding and found both applicants legally, technically, and financially qualified to construct, own, and operate the proposed television station. The Commission also found that, on the basis of the proposed policies, program service, staffing, management, and operational proposals, a grant to either applicant would be in the public interest. Certain weight was given to On The Air for past radio experience which was found to be counterbalanced by similar considerations in favor of Evansville. After absolving Mr. Rex Schepp, a stockholder in Evansville TV, of certain lack of candor charges propounded by On The Air in disclosing certain information to the Commission, the Commission then turned to the points of differences urged by the parties as entitling them to substantial preferences.

III. NO PREFERENCES AWARDED EITHER PARTY ON BASIS OF

1. Network proposals
2. Local programs
3. Staff proposals
4. Studios and technical equipment
5. Previous broadcast experience
6. Diversification of business interests
7. Participation in civic activities

IV. PREFERENCE AWARDED TO ON THE AIR

1. Slight preference in local programing but differences not considered major in nature.
2. Local residency of stockholders.

V. PREFERENCE AWARDED TO EVANSVILLE TV

1. Clear preference in criterion of integration of ownership with management.
2. Narrow preference with respect to likelihood of effectuation of television proposals.
3. Diversification of media of mass communication.

VI. FACTS UNDERLYING THE DIVERSIFICATION PREFERENCE

Evansville TV presently holds no interest in any media, whereas On The Air is the licensee of 1 of 4 standard broadcast stations in East St. Louis, Ill. Another wholly owned subsidiary of Curtis Radiocasting Corp. is the licensee of 1 of 2 standard, broadcast stations in Terre Haute, Ind. On The Air also is the licensee of FM station WMLL, Evansville, and the other subsidiary of Curtis Radiocasting Corp. is the licensee of WBOW-FM. These facilities are concentrated in a relatively small triangular area.

(The further letter from the Commission on this matter is as follows:)

FEDERAL COMMUNICATIONS COMMISSION,
Washington, D. C., August 30, 1956.

Hon. WARREN G. MAGNUSON,
Chairman, Committee on Interstate and Foreign Commerce,
United States Senate, Washington, D. C.

DEAR SENATOR MAGNUSON: Reference is made to your letter of July 13, 1956, and to the earlier exchange of correspondence between Mr. Warren E. Baker, General Counsel of the Commission, and yourself, regarding the testimony of Mr. Henry B. Walker, of Evansville, Ind., before your committee on May 15, 1956.

You may recall that your letter of July 13 was sent only several days prior to my appearance before the committee on July 17, 1956. In that letter, you inquired whether I had any comments additional to those which Mr. Baker had expressed earlier regarding application of the diversification doctrine in the comparative proceeding for channel 7, Evansville, Ind. Following denial of the petition for rehearing in this case, the General Counsel's Office forwarded to the Commission the correspondence which had passed between you and Mr. Baker. I have examined these letters, and wish to state that I am completely in accord with the views expressed by Mr. Baker. My agreement with Mr. Baker's views was made clear in my testimony of July 17, 1956, at which time, you may recall, I also made my additional comments on the channel 7 proceeding.

However, there is one aspect of the Evansville proceeding which remains to be commented on. It appears that Mr. Walker's testimony on May 15, 1956, left Senator Pastore with the impression that one of the principals in the successful applicant was a professional applicant. At that time, Senator Pastore seemed to be concerned that the Commission's licensing processes might be abused by persons who were, in effect, nothing but professional applicant[s] for TV stations. (Transcript of the hearings, May 15, 1956, p. 3043. See also pp. 2998–3003; 3039–3040.) When I last appeared before this committee on the television hearings, Senator Pastore again expressed his concern on this matter, and also wondered whether it was possible for such a professional applicant, after disposition of prior interests, to move to another locale, apply for a license there, and then be preferred on a comparative basis because of his experience gained through previous operations (transcript of hearings, July 17, 1956, pp. 4815–4817). At that time, I assured Senator Pastore that the Commission would write this committee, explaining the facts underlying this aspect of the Evansville proceeding.

Apparently Senator Pastore, in asking this question of the Commission, had reference to Mr. Rex Shepp, president and director of Evansville Television, Inc., the successful applicant in the channel 7 hearings. After reexamining the record, it is my belief, as well as that of the other members of the Commission, that nothing therein justifies the assumption that Mr. Shepp was a professional applicant, interested mainly in short-term trading in television licenses.

Before reaching the facts of record supporting this conclusion, it would be helpful first to discuss certain Commission policies which have a bearing on this point. In the exercise of its licensing functions, the Commission has long had a policy against trafficking in licenses. Prior to articulation of this policy in its present form, the Commission had been called on a number of times to determine whether it would be in the public interest to grant an application of one who intended subsequently to assign an instrument of authorization to third persons on whose qualifications the Commission had been afforded no opportunity to pass. It early adopted a policy against refusing to grant applications to such "strawmen," *Replogle* (1 F. C. C. 256, 258); *Advertiser Publishing Company, Ltd.* (4 F. C. C. 498, 501), on the rationale that failure to disclose the identity of a real party in interest militated against the personal relationship between the Commission and its licensees, which was contemplated by the Communications Act. *Porter and Eversole* (4 F. C. C. 680, 682). See also *Hearst Radio, Inc.* (7 F. C. C. 292, 295).

The Commission's policy against trafficking in licenses, as such, received expression in later cases. One of the first of these cases where that policy was discussed is *Powel Crosley, Jr.* (6 Pike & Fischer, Radio Regulation 6, 26). There, it was decided that "[t]here could be little dispute that sound public policy will not permit us to countenance speculation in the public domain," and that, as had been stated earlier in certain letters to Congress, it was "the Commission's policy to disapprove of transfers which obviously represent the activities of a promoter or broker, who is simply acquiring licenses and trafficking in them."

Senator Pastore's concern over the possibility of abuse of the Commission's licensing processes by short-term traders in licenses raises, in our opinion, principally the question of whether Mr. Rex Shepp was guilty of trafficking in licenses.

At the outset, I should like first to correct a mistaken impression of the facts which Senator Pastore may unfortunately have received from Mr. Walker's testimony before this committee. From certain remarks made by Senator Pastore during the course of the May 15 hearings, it appears that he believed Mr. Shepp had previously procured three television grants prior to applying for the Evansville channel. (See transcript of hearings for May 15, 1956, pp. 3039–3040.) However this impression may have arisen, the facts are, of course, otherwise. For the record on which the Commission based its grant to Evansville Television, Inc., shows that two of the past licenses in which Mr. Shepp had an interest (but never wholly owned) were for radio facilities, and that Mr. Shepp's only interest in a television station prior to the instant grant was a derivative one, stemming from the fact that the broadcast station in which he last held an interest in turn owned stock in a television licensee.

The facts on this point appear in paragraphs 6 to 9, inclusive, of the Commission's decision. Although a copy of this decision has been sent to this committee previously, we have attached another copy to this letter, for your convenience in referring to these basic facts.

The facts show that from 1940 to 1947, Mr. Shepp was employed as the general manager of station WIRE, Indianapolis, Ind. Shortly before taking this position, during 1939, he had become associated as vice president and a 25-percent stockholder in North Jersey Broadcasting Co., an applicant for a radio station in Paterson, N. J. After a grant of North Jersey's application, Mr. Shepp assisted in supervising construction and initial operation of that licensee's station. In 1942, he disposed of his stock interest in North Jersey (decision, par. 6).

While still employed as the general manager of WIRE, in Indianapolis, Mr. Shepp, in 1944, organized and became president and a director of, and a 28-percent stockholder in Phoenix Broadcasting, Inc., which then purchased radio station KPHO, Phoenix, Ariz. In 1945, Mr. Shepp became the majority stockholder of this licensee by acquisition of additional stock. In 1947, he resigned his position as general manager of WIRE and moved to Phoenix to manage station KPHO, a position he held until 1950, when he disposed of his interest in Phoenix Broadcasting, Inc. His 51-percent interest in Phoenix Broadcasting was reduced in 1949 by the sale of unissued stock to third persons. In 1950, Mr. Shepp disposed of his interest in Phoenix Broadcasting (decision, pars. 7 and 9).

Prior to the disposition of his interest in Phoenix Broadcasting, Mr. Shepp acquired a derivative interest in television station KTXL (whose call letters were subsequently changed to KPHO–TV), Phoenix, Ariz., by reason of Phoenix Broadcasting's acquisition of a stock interest in Phoenix Television, Inc., the holder of a construction permit for station KTXL. The record shows that Phoenix Broadcasting acquired its stock interest in November of 1949, and since Mr. Shepp disposed of his interest in Phoenix Broadcasting on April 29, 1950, this would naturally mean his derivative interest in Phoenix Television was simultaneousily terminated (decision, pars. 8 and 9).

In the judgment of the Commission, we do not believe that Mr. Shepp's acquisition of his prior broadcast interests and subsequent disposal of them involves the type of short-term profiteering in stations which is proscribed by our policy against trafficking in licenses. You will recall from the facts discussed previously that Mr. Shepp's first interest (in North Jersey Broadcasting Co.) amounted to only 25 percent, and that this interest was held from 1939 until 1942. The second broadcast interest which Mr. Shepp held, his interest in Phoenix Broadcasting, Inc., extended from 1944 through 1950. We do not believe that the holding of either of these interests was of such an unreasonably short duration as to justify the conclusion these interests were acquired on short-term considerations alone. With respect to Mr. Shepp's derivative interest in Phoenix Television, Inc. (which extended from November 16, 1949, the date on which Phoenix Broadcasting, Inc., subscribed to stock in Phoenix Television to April 29, 1950, the date on which Mr. Shepp sold his interest in Phoenix Broadcasting, Inc.), it is true, of course, that the holding period is relatively short

But considering the derivative nature of the interest held, and the fact that at the time Phoenix Broadcasting, Inc., acquired its interest in Phoenix Television, Inc., Mr. Shepp owned only 43.7 percent of Phoenix Broadcasting's stock, we do not feel that there is involved here the activities of a professional applicant.

I am sure that a moment's reflection on the basic problems involved in applying the policy against trafficking will convince you of this. What is needed essentially in applying this doctrine is a balancing of conflicting considerations. On the one hand, the Commission is naturally interested in seeing that its licensing processes are not made the vehicle for speculation in a resource which lies in the public domain; it is to this end that our policy against trafficking in licenses was developed. On the other hand, it is obviously equally in the public interest, in order to permit the free flow of risk capital into the broadcast industry, not to bar experienced station owners who have disposed of prior interests from reentering the broadcasting field by an overly rigid application of the policy against trafficking. It goes without saying, of course, that in every case, the balance which will ultimately be struck must rest on the facts and circumstances before us in any particular case. It is my feeling that the adjustment of the competing interests arrived at here is correct and rests on unimpeached record facts.

Senator Pastore also seemed to be concerned over the possibility of a professional applicant's moving to a new locale, after divestiture of prior interests, and subsequently, in a comparative proceeding, being accorded a preference on the basis of the past broadcast experience gained through operation of former stations.

Apropos of this problem, I think it is clear from the Commission's decision that Evansville Television, Inc., was not accorded a preference because of Mr. Shepp's past experience in radio and television. Paragraph 87 of the decision, which discusses the comparative aspects of the applicants' past broadcast experience, shows the Commission found that On the Air, Inc. (the applicant in which Mr. Walker had an interest), and Evansville Television, Inc., were equally balanced on this factor. The Commission adherred to this position in ruling on the petition for rehearing filed by On the Air, Inc. (A copy of the memorandum opinion and order disposing of the petition for rehearing has already been sent to this committee.)

I trust that I have answered the questions asked by Senator Pastore. However, in the event you have any further questions you may wish to ask on these problems, please do not hesitate to let me know.

Sincerely yours,

GEORGE C. MCCONNAUGHEY, *Chairman.*

Mr. COX. Is it a fair statement with regard to that letter, Mr. Baker, that although this has been considered in other cases, perhaps, that it is accurate to say that this was the first case in which a ruling on this diversification criterion was made adverse to one party solely on the grounds of the ownership of AM licenses, and not upon a combination of radio and newspapers, and usually centering down on the very community in which the television license is being sought?

Mr. BAKER. I think my letter speaks for itself in that area. That is with respect to a television case this is the first case in which radio ownership only has been a controlling factor, adverse to the individual. In many instances, however, it has been weighed and has merely been offset by other things.

Mr. COX. Yes. In other words, again, isn't this one of these situations where you get a slight conflict in your criteria? That is, you are interested in prior broadcast experience and in an area where television stations are coming into existence for the first time, the only people who can qualify are owners of radio stations; and that you now have working against that a criterion that says if you do find a man who has divested himself of all prior broadcast commitments, he comes in with the benefit of the experience and can assert a preference because he has no present holding?

Mr. BAKER. Yes. I can think of one other case, for example, in Tampa, in which one of the exhibits—one of the principal stockholders in the application—contributed broadcasting experience to the successful applicant. But because he had divested himself of his radio facilities, or was proposing to divest himself, they were preferred. Now, it so happened on the other side of the case that the other applicant happened to have newspaper ownerships in addition. But I mean, but for that you would have had a rather similar situation. What I am saying is that this is a factor which the courts have held the Commission must consider. Any time there is any factor which must be weighed, it is conceivable that at sometime that particular factor will be the one which you will say is the controlling one, if everything else balances out. I mean it just stands to reason, you either must weigh it or you don't. If you weigh it, it ultimately, in some case, is going to come up to be the one which swings the balance.

Mr. COX. All right. With reference to the matter of subscription television, that is another proceeding which the Commission has had under consideration. Is there anything to report with respect to the status of that?

Mr. McCONNAUGHEY. I think I can answer that very quickly, by stating we have been devoting our time on this allocation matter—practically all the staff, day and night, and I mean night, too—and we have not gotten any further on subscription television.

Mr. COX. I think, of course, the committee indicated they wanted the allocations matter treated with priority.

Mr. McCONNAUGHEY. That is what your committee told us, and what we have tried to do.

Mr. COX. Am I correct in my understanding that while you have been, therefore, waiting to give further consideration to this issue, that petitions have been filed with the Commission for experimental use of a subscription service in connection with UHF stations now off the air, and that the Commission has denied those, almost at the outset, on the ground that they are premature; is that correct?

Mr. McCONNAUGHEY. That is correct, Mr. Cox.

Mr. COX. In other words, the Commission is of the opinion that not even experimental use of subscription television should be authorized until it has reached its final conclusion on the general soundness of the proposals that have been made?

Mr. McCONNAUGHEY. I can only answer for myself in that regard. Since this matter is before us, I feel that possibly along the line, that we should, personally speaking, consider permitting experimental subscription television operation someplace. I say that is just my own thinking, offhand. I haven't studied it too much. I think we possibly should permit an experimental operation of subscription television. And I am not going to be tied to that, either.

Mr. COX. Now, it has, I suspect, been quite clear, both in your appearances before this committee and in your more recent appearances before certain of the House committees, that there is a good deal of concern over the question of the division of responsibility between the Commission and the Antitrust Division of the Department of Justice with respect to antitrust matters, in terms of primary jurisdiction and concurrent jurisdiction with respect to possible violations of the antitrust laws. You will recall that the committee wrote to the Commission and to the Department of Justice asking for comments upon testimony of Mr. Moore regarding his opinions as to the validity of certain network practices. The replies of both agencies were put into the record, and indicate, still, a feeling on the part of each that perhaps this is something that the other one should be looking into.

I think since that time the committee has again written to each of the agencies urging renewed efforts to try to mark out the divisions of responsibility. Is the Commission presently pursuing any course of discussion with the Department trying to achieve that end? Maybe Mr. Baker can answer that.

Mr. McCONNAUGHEY. General Counsel can answer that.

Mr. BAKER. I can answer that, in this sense: That, as you know, Senator Magnuson wrote us a letter and we are in the process of replying to that. That reply is just about ready, but because of the fact that it only represents my viewpoint and has not yet been coordinated with the Chairman and the Commissioners, I can't tell you whether that is actually the view. I expect that it will be in your hands in the very near future.

Mr. Cox. We will have it then for the record. Thank you.[1]

Now, turning to one matter that is perhaps new to our deliberations. Since you appeared here last, Senator Bricker has submitted a proposal—I don't know whether the bill has actually been introduced or not—with respect to a change in the Commission's multiple-ownership rule. Now, is there pending now before the Commission any rulemaking proceeding in which such changes are being considered?

Mr. McCONNAUGHEY. No, sir.

Mr. Cox. Has the Commission given consideration to the questions posed by such a suggestion?

Mr. McCONNAUGHEY. Only to this extent, Mr. Cox: Nothing other than, I think it is—since the Supreme Court has sustained the Commission's rulemaking power with reference to multiple-ownership—that I think it is the feeling of the Commission that any changes that would be made should be made by the Commission rather than by congressional action. If any changes should be contemplated, it should be by the Commission rather than by congressional action.

Mr. Cox. So the Commission would then give thought to whether this was desirable, and if so would initiate a rulemaking proceeding?

Mr. McCONNAUGHEY. I think so. The reason I can say that is I think the Commission is much more flexible—can make itself more flexible as to changing conditions—than you can by enacting a statute and then trying to repeal it if conditions change too fast.

Mr. Cox. Is it correct to say that the argument in support of some such shift from a fixed number to a percentage of population is based on the feeling that one man may own 7 stations and the other man may own 7 stations, and yet they are far different in terms of their coverage, in terms of their impact and importance?

Mr. McCONNAUGHEY. That is right. It is a matter that I think the Commission is going to be cognizant of, and it involves a lot of problems. When you speak of percentages you have to be very careful about getting a concentration. You might have 25 percent, and that might pretty well control 2 or 3 States. I think you have to consider what you would have in individual States, in individual territories.

[1] This letter is published in the volume on Network Practices.

I mean there are a lot of problems. That is all I am trying to point out.

Mr. Cox. Isn't it possible that while you might be achieving an equalization between the position of a multiple owner of smaller stations and the more fortunate, perhaps, owner of larger stations, that this whole thing would contribute, however, to an increased concentration of ownership in the entire broadcast field?

Mr. McConnaughey. I think that is correct. And that might be good or it might be bad; I don't know.

Mr. Cox. I believe you told the Celler committee recently that you had on the average of about 30 transfers of control per month in both radio and television.

Mr. McConnaughey. I think that is about what they run. That is radio and television.

Mr. Cox. Now, of course——

Mr. McConnaughey. There aren't many in television; most all of them are in radio.

Mr. Cox. I recognize in many instances there is a shift of stock ownership, not a real shift in the individuals concerned.

Mr. McConnaughey. That is right.

Mr. Cox. But isn't it true where there is an outright sale that, generally speaking, these have been moving, not from the hands of one single owner into another single owner, but from a single owner into the hands of multiple owners?

Mr. McConnaughey. I don't know what the general rule is, but there have been quite a number of them that that has been the case.

Mr. Cox. Now, in connection with furnishing us with these criteria used in comparative cases, can you also furnish us with the criteria, if any, which are used in connection with passing upon the application for a transfer?

Mr. McConnaughey. Criteria?

Mr. Cox. Yes. In other words, you have a question of possible duopoly; do you not?

Mr. McConnaughey. Yes, yes, yes. We will be very happy to.[1]

Mr. Cox. Isn't it true, though, that at this point you apply a completely different set of criteria than you applied when the original grant was made?

Mr. McConnaughey. Yes; that is because of the congressional act, section 319 (b), or 310 (b), maybe.

Mr. Cox. 310 (b)?

Mr. McConnaughey. Yes.

Mr. Cox. What is the operation of that, Mr. Baker?

Mr. Baker. Just read the last sentence of it, and it answers it, Mr. Cox. It speaks for itself.

Mr. Cox. You are simply permitted to determine the legal, technical, and financial qualification of the proposed transferee?

Mr. Baker. Let me read for the record that language.

Mr. Cox. All right.

Mr. Baker. And this relates to applications for transfer of construction permits, or transfer. It says:

> Any such application shall be disposed of as if the proposed transferee or assignee were making application under section 308 for the permit or license in

[1] The Commission later advised the committee staff, however, that it had nothing to add to its testimony given at this time.

question, but in acting thereon the Commission may not consider whether the public interest, convenience, and necessity might be served by the transfer, assignment, or disposal of the permit or license to a person other than the proposed transferee or assignee.

That is a specific prohibition in the law. Therefore, that means that you must consider it only on whether the particular applicant meets the minimum qualifications of meeting the public interest. You may not say it would be better for someone else to own it?

Mr. Cox. I take it, though, that the Commission would still be permitted, even under that language, if it felt that there were others—or that the public interest would be better served, if this particular transferee was not permitted to operate the station, it can simply deny the transfer and then permit the transferor to seek another purchaser and then pass upon the application for that transfer? In other words, at this point you simply consider whether or not you will approve the transfer to this individual who has reached an agreement with the present owner?

Mr. Baker. The first part of your statement, I don't think the legislative history of this particular amendment would bear out. That is, I don't think you can take into consideration the abstract that someone else might be better and might apply.

Senator Pastore. That is right. In other words, according to the law all you have to consider is the qualification of that transferee. There may be somebody better qualified, but that isn't the question.

Mr. Baker. That is right. That is what the Congress decided in 1952.

Mr. Cox. I think that when you were here before the chairman indicated that he might like to have you comment upon the problem of political time. To this point, no separate hearings have been held on this. Does the Commission have any comments to make in terms either of problems which it now faces, or recommendations for changes of section 315, which it feels might be desirable?

Mr. McConnaughey. General counsel would be glad to expound on that subject.

Mr. Baker. I can only state the Commission's position in this sense. The Commission has commented on half a dozen bills with respect to section 315, and I don't think that I could in any short statement improve on the comments. They more or less covered the situation.

Mr. Cox. These will be part of the records in the hearings held on the House side?

Mr. Baker. And in the Senate. We have commented in both places.

Senator Pastore. Any further testimony on the part of any other member of the Commission? We are very delighted to have you here. We will welcome your comments or observations if you desire to make them.

Off the record.

(Discussion off the record.)

Senator Pastore. Mr. Lee?

Mr. Lee. Off the record.

(Discussion off the record.)

Senator Pastore. Very well, we will adjourn until tomorrow morning at 10 o'clock.

(Whereupon, at 12:10 p. m., the committee adjourned.)

(Matter referred to earlier as being printed at the conclusion of the Commission's testimony is as follows:)

FEDERAL COMMUNICATIONS COMMISSION,
Washington, D. C., August 30, 1956.

Hon. WARREN G. MAGNUSON,
Chairman, Senate Committee on Interstate and Foreign Commerce,
United States Senate, Washington, D. C.

DEAR SENATOR MAGNUSON: In the Commission's July 17, 1956, appearance before your committee's television inquiry I was asked to furnish for the committee approximate figures on the amount of time Federal Communications Commission personnel had spent, during the 2d session of the 84th Congress, on congressional hearings, giving special attention to any duplication of work.

Comparatively little duplication was involved in the hearings on specific legislative proposals. However, we did find considerable duplication in the preparation, attendance, and followup involved in congressional investigative hearings. Three of the investigatory bodies before whom the Commission was asked to appear and/or furnish extensive information were, the Small Business Subcommittee of the House Government Operations Committee, the Anti-Monopoly Subcommittee of the House Committee on the Judiciary, and, of course, your committee's television inquiry. Much of the information requested from the Commission for all three of these investigative hearings was duplicate. I do feel that a considerable amount of time could be saved if some system were instituted in which this kind of duplication could be avoided. However, it is my opinion that such a procedure should be initiated by the Congress and not the agencies involved.

Most of the duplication involved in legislative hearing matters could be avoided if the procedure, suggested by your committee, of requesting only new information or information not already available were more widely practiced.

Attached is a copy of the final Commission figures, in man-hours, devoted to congressional hearings. If we can be of further assistance please feel free to call on us.

Sincerely yours,

GEORGE C. MCCONNAUGHEY, *Chairman.*

FEDERAL COMMUNICATIONS COMMISSION—2D SESS., 84TH CONG.

FEDERAL COMMUNICATIONS COMMISSION,
Washington, D. C., August 30, 1956.

Hon. WARREN G. MAGNUSON,
Chairman, Interstate and Foreign Commerce Committee,
United States Senate, Washington, D. C.

DEAR SENATOR MAGNUSON: At the hearing before your committee on Tuesday, July 17, 1956, it was requested that we supply the commitee with a list of the various criteria which are considered by the Commission in comparative television licensing procedings. A discussion of the relative importance of the criteria, if such difference exist, and whether some of the criteria are contradictory to each other, was also requested (transcript, p. 4812, vol. 30). We will try in the succeeding discussion to set out as definitively as possible the information responsive to their requests.

As to your first request, Congress in the Communications Act of 1934 or its several amendments refrained from laying down definitive criteria to guide the Commission in selecting the best qualified applicant among several competing for a particular channel or facility. Instead, it has left that task to the Commission to work out under the applicable standard, the public interest, convenience, and necessity.

A list of the comparative criteria, which have been evolved and employed by the Commission in the comparative television cases, would include the following: Proposed programing and policies, local ownership, integration of ownership and management, participation in civic activities, record of past broadcast performance, broadcast experience, relative likelihood of effectuation of proposals as shown by the contacts made with local groups and similar efforts, carefulness of operational planning for television, staffing, diversification of the background of the persons controlling, diversification of control of the mediums of mass communications.

In considering the above list, two points should be kept in mind. The list is not the final, absolutely complete delineation of all the criteria which will be considered in the determination of the better qualified applicant from the viewpoint of the public interest. As the Commission gains added insight into its complex and difficult processing task, new factors may be included or a particular factor may be dropped as having been found to have no real decisional vitality. The factors on the above list did not present themselves to the Commission simultaneously in the Commission's first or even first hundred comparative decisions They were worked out by the agency gradually and laboriously over its years of licensing since 1927. An example in the present period may point up the dynamic nature of the task: The Commission, in the recent television cases, has not bestowed any preference to applicants on the factor of greater comparative coverage because of its conclusion that the tools now available or employed for the prediction of TV coverage are not sufficiently reliable to enable the Commission to make coverage findings which would have decisional significance. (See *Television Spokane, Inc.*, 9 Pike & Fischer, R. R. 713.) But as the tools become perfected or new methods are employed, comparative coverage might become a pertinent issue in the television proceedings. (See *Midwestern Broadcasting Co.*, 13 Pike & Fischer, R. R. 613.)

The second point is that a particular case may present facts pertinent to and perhaps decisive of the public interest determination, which do not, strictly speaking, fall within any of the above listed categories. For example, one applicant may have engaged in trade practices or violations of law outside of the broadcast field to an extent which, while not disqualifying, does raise doubt as to the likelihood of his operating completely in the public interest—a doubt which does not exist in the case of his rival who has no such adverse record. (See, e. g., *Radio Fort Wayne, Inc.*, 9 Pike & Fischer, R. R. 1221). Similarly, there may be marked differences in a case in the applicants' particular policies of service to the area involved. (See *Petersbury Television Corp.*, 10 Pike & Fischer, R. R. 567). Or the case may be decided, under section 307 (b), upon the basis of the relative needs of two closely located but distinct communities for the single channel available to them.

In short, it is impossible to detail or foresee all the facts that could be pertinent to the public interest determination. As the court of appeals stated in the leading case (*Johnston Broadcasting Co.* v. *Federal Communications Commission*, 175 F. 2d 351, 357–358):

"In sum, we think that there are no established criteria by which a choice between the applicants must be made. In this respect, a comparative determination differs from the determination of each applicant's qualifications for a permit. A choice can properly be made upon those differences advanced by the parties as reasons for the choice * * * It is true that a few items upon which comparisons could be made might be prescribed, but such a list could not encompass every factual possibility * * *"

In keeping with this directive, the Commission permits the adducement by the parties of all facts pertinent to the comparative judgment. And in the final decisional process, the Commission must, in discharging its function under the public interest standard, consider all points based on such record facts—even though falling outside one of the criteria in the above list. This duty has been made clear by judicial interpretation of the Communications Act. (See *Johnston Broadcasting Co.* v. *Federal Communications Commission*, 175 F. 2d 351.)

Turning to your second request—the relative importance of the criteria—we point out that a precise delineation is even more inappropriate on this score. Thus, we could say that three factors on the list, diversification of the background of the persons controlling, participation in civic activities, or carefulness of operational planning for television, do not carry the same weight as the others. But in given circumstances this would not hold true. For example, taking the last-named factor (carefulness of planning), normally the difference in the applicants' planning, while it may be decisionally significant, does not entitle one applicant to a very important preference over its rivals. (See, e. g., *Tampa Times Co.*, 10 Pike & Fischer, R. R. 77, 136–7.) But imagine the case of an applicant whose plans are completely confused and muddled. Serious doubt might arise as to the likelihood of effectuation of that applicant's programing proposals, and thus the applicant would be at a distinct, not a minor, disadvantage. Further, the applicants may be so evenly matched on all other criteria that a preference in any of the three listed categories could be decisive of the whole case.

As to the other criteria listed, we do not believe any ranking in order of importance is advisable, or indeed, possible. We have stated repeatedly that "there is no all-embracing, absolute criterion" (*Tampa Times Co.*, *supra*, at 126). Proposed programing has been called the essence of service to the public, but that proposal must be viewed in conjunction with the factors going to the likelihood of its effectuation. We cannot say that the proposal is of greater importance than the assurance of its effectuation. Further, the grant of a license is for a considerable period. Accordingly, factors going to the likelihood of continued sensitivity to the area's changing needs cannot properly be given a subordinate role. Nor can the important public-interest consideration of diversification of control of media of mass communications be labeled secondary to the other factors.

We are firmly of the opinion that the only proper approach is to look to the facts of each case. An example may best point up the wisdom of this approach. The normally important factors of local residence and integration of ownership and management (and also participation in civic activities), usually are of lesser significance when dealing with applicants who both have past broadcast records. For such records, being in the nature of an actual demonstration, are more persuasive evidence on the question of effectuation of proposals or continued sensitivity than can be gleaned from the three mentioned criteria—integration, local residence, and civic participation (*The Tribune Co.*, 9 Pike & Fischer, R. R. 719, 770 a-c). However, in the case of the newcomer to the broadcast field, these criteria are of great significance since there is no other way to evaluate such an applicant in this important decisional area (*The Radio Station KFH Co.*, 11 Pike & Fischer, R. R. 1, 103–4). And finally, the evaluation of the newcomer with integration and local residence against the established broadcaster depends on the nature of the particular past record and the integration and local residence showings involved. (Compare *McClatchy Broadcasting Co.*, 9 Pike & Fischer, R. R. 1190, with *The Radio Station KHF Co.*, *supra*.)

In short, here again the facts are controlling. As stated by the court of appeals in its stricture against a mechanical or numerical approach, "a slight degree of superiority in several factors might be more than offset by substantial inferiority in one" (*Scripps-Howard Radio, Inc.* v. *Federal Communications Commission*, 189 F. 2d 677, 680, *cert. denied* 342 U. S. 830).

Your final request is an inquiry whether certain of the factors considered by the Commission are contradictory. By "contradictory," I understand you to mean an attribute of an applicant which may lead to both a preference in one area of comparison and a disadvantage in another. The nswer to this question is "Yes."

Thus, such a situation exists in the case of the applicant who, at the time of his television application, controls other media of mass communications. Such an applicant, if the operator of a radio or television station, may obtain a preference in the categories of past broadcast record and broadcast experience; or if the mass media instrument in question is located in the area where application has been made, the applicant may obtain a preference because of his knowledge of/or insight into the needs of that area (the factors of local residence or participation in civic activities). But the same applicant might be at a disadvantage on the factor of diversification of control of the media of mass communications. It is, of course, impossible to delineate outside the facts of a particular case the relative advantages or disadvantages. We do not believe there is anything amiss in this "contradictory" situation; the Commission is simply discharging its duty, under the statute, to take into acount all facets of the public interest judgment.

In concluding, I express my regret that a more definitive answer to your inquiries is not possible. I think you will agree, however, that a mechanical or preordained approach to the television licensing process, since it would not permit proper evaluation of all pertinent facts, would be in derogation of the public interest standard.

If I can be of any further assistance to you in this matter, please do not hesitate to call on me.

By direction of the Commission:

GEORGE C. MCCONNAUGHEY, *Chairman.*

TELEVISION INQUIRY

(UHF-VHF Allocation Problem)

WEDNESDAY, JULY 18, 1956

UNITED STATES SENATE,
COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE,
Washington, D. C.

The committee met, pursuant to adjournment, at 10:30 a. m., Senator Frederick G. Payne, presiding.

Present: Senator Payne.

Also present: Wayne T. Geissinger, assistant chief counsel; Kenneth A. Cox, special counsel; Nicholas Zapple, staff communications counsel.

Senator PAYNE. The hearing will be in order.

The witness this morning is John W. Boler, president of the North Dakota Broadcasting Co. Mr. Boler, we will be very happy indeed to hear from you, sir.

I apologize, as far as I am concerned, for not getting here ahead of time, but it so happens that I just learned about the fact that there was a shortage of people up here just a couple of minutes ago.

Mr. BOLER. I appreciate the opportunity of being here. This is a rather lengthy statement.

Senator PAYNE. You may proceed.

Mr. BOLER. I will read the statement without the exhibits, or I will read the entire statement, or we can put it in the record and we can have questioning.

Senator PAYNE. Proceed any way you care to. The statement, I understand, is 10 pages.

Mr. BOLER. That is right.

Senator PAYNE. Why don't you go ahead with the statement, with the understanding that the exhibits will all be made a part of the record.

Mr. BOLER. Fine.

STATEMENT OF JOHN W. BOLER, PRESIDENT OF THE NORTH DAKOTA BROADCASTING CO.

Mr. BOLER. My name is John Boler. I am president of the North Dakota Broadcasting Co. This company owns and operates KXJB-TV, Valley City; KBMB-TV, Bismarck; KCJB-TV, Minot; KCJB radio, Minot; KSJB radio, Jamestown, all located in the State of North Dakota.

I appreciate being given the opportunity to appear before you today to discuss American Telephone & Telegraph Co. tariff and general business practices. I hope that I can submit sufficient evidence to convince you that a very thorough investigation should be made of A. T. & T. tariffs and of the general business practices of the A. T. & T. I do not believe the Federal Communications Commission has the funds to make such an investigation, and I hope that this committee may be able to remedy this situation.

First, in reference to business practices, it refuses services, except at its convenience, and then at arbitrary tariffs dictated by it. To be specific, let me tell you of my experience with A. T. & T., which I believe will confirm these facts.

Over a period of 3 years, from the fall of 1951 through June 1954, I made numerous inquiries of A. T. & T. relative to television network service facilities, and in most instances they did not even have the courtesy to respond. At this time the telephone company did not have facilities to extend network programs into our State. The closest city for interconnection was Minneapolis, Minn. An inquiry was made of the telephone company when and if such facilities would be available to extend television programs into North Dakota. The first such inquiry was made of the phone company in October 1951. Its answer was that it could give no date; further, it had no plans whatsoever for such service in the immediate future. Later, we inquired again to see if there were any new developments, and received similar reports. The latest inquiries, made through our local telephone company, brought us the response that it would be 1956 or 1957 before it could have service to Fargo, and 1958 or 1959 before they could serve Bismarck or Minot.

We made inquiry of the FCC as to whether or not we could obtain construction permits to build a private relay link between Minneapolis and Fargo, N. Dak., to obtain live television service. We based our inquiry on our understanding that FCC rules provided that if a common carrier has no facilities, a private system may be licensed; further, we informed the Commission we could not afford the common carrier service even if it were available. Members of the Commission staff informed my attorney that we had to obtain a letter from the common carrier confirming that they did not have facilities and/or that they had no immediate plans for installation of such facilities. We were so naive as to believe that the A. T. & T. would confirm its lack of interest and/or inability to furnish facilities.

A. T. & T. officials did not respond directly in writing to our inquiries, but their representatives got word to us to the effect that in their opinion it was economically impractical to establish television stations in North Dakota, and that anyone considering such a venture should have his head examined.

In view of this attitude, we anticipated no problems in obtaining the necessary permits from the FCC to install our own private system between Minneapolis and Fargo and proceeded therefore to obtain all of the necessary engineering data and financing to build such a private system to service our own stations. After 4 months of fieldwork, determining sites for the microwave towers, making leases, and so forth, we completed our application and filed it with the FCC for the necessary microwave relay links between Minneapolis and Fargo to interconnect us with the networks. The FCC staff requested that we obtain a formal letter from the A. T. & T. stating its intent re establishing service parallel to our planned system. The commercial manager in the Fargo office of the telephone company advised that the could get no response from the A. T. & T. This was in February 1954. I told this representative that either I get a response immediately or I would call the president of A. T. & T. or file a formal complaint with the FCC.

The following day I received a call from him asking for an appointment for a representative of A. T. & T. Mr. Edward Laird, Jr., commercial manager of A. T. & T. long lines division for our area, arrived in North Dakota for this appointment. Mr. Laird questioned the wisdom of establishing television stations in North Dakota and wanted to know if we would be able to pay the bill if the phone company put in such facilities. We advised him that we did not want their facilities or their advice; we wanted to build our own private system and needed a letter from him advising A. T. & T. lack of interest and/or inability to furnish service. When he was asked why he did not reply to all previous requests during the past several months, he stated that he could not believe it was a serious inquiry. He said the company received numerous inquiries nationwide from people who were dreaming about going into television and they simply could not pay attention to all such requests.

Senator PAYNE. In other words, am I to understand you started making the inquiries on this back in 1951?

Mr. BOLER. That is correct, sir.

Senator PAYNE. And in 1954 there was suddenly enough interest to apparently come and talk with you?

Mr. BOLER. They found out that we had been engineering our system from Minneapolis to Fargo. We started in late October, in 1953. They found out finally—they were told, tipped off by the Northwestern office in Fargo—that we actually were surveying and were going to apply for a permit. And that one of the reasons primarily, now that we were putting the pressure on to get a response, is because the FCC rules required that we had to show evidence that there were no facilities, or they would not put them in. They stalled, delayed, wouldn't write a letter.

Finally, when they discovered that we had our engineering all done and were going after our private system, then they immediately came right up.

Mr. COX. When did your stations go on the air?

Mr. BOLER. Our first station went on the air in April 1953, in Minot. And prior to that, of course, our application had been on file for many months before.

In other words, in 1952 we actually did the engineering for our first station, and we were operating a closed circuit television system in Minot training our staff because of the shortage of television employees. So actually, in October 1951, is when we decided to plan financing and go into TV.

Mr. COX. When was your Fargo station——

Mr. BOLER. The Fargo station went on the air August 12, 1954.

Mr. Laird then advised us that A. T. & T. would be willing to push its construction schedule up to meet our demand providing we would be willing to pay an expediting charge of $22,000, and then it promptly notified the FCC of its offer to us in order to block our application for the private system. They notified our competitor simultaneously, and our competitor accepted A. T. & T.'s offer and therefore we were forced to accept common-carrier service. We refused to pay the expediting charge and now the A. T. & T. is suing us for it, right now. (See exhibit 1, page 992).

Now, I ask you: Is it your intent that A. T. & T. be the agency that advises the broadcaster whether or not it is economically feasible to have television service in North Dakota, instead of the licensing agency? Is it your intent that the common carrier ignore all verbal and written requests for information as to availability of facilities, and do so continuously for a period of months on end and/or until such time as it is threatened with the installation of a private system? Is it your intent that this Government-protected monopoly put a broadcaster to the expense of engineering a private system at a cost of thousands of dollars, only to have the permits for the private system denied because the common carrier changes its mind at the last minute when it sees that the broadcaster intends to install his own private system? Under the existing FCC regulations, A. T. & T. can automatically block the installation of a private system through reversing its decision at will and offering to give service, thereby preventing the FCC from granting a permit for a private system.

This, gentlemen, is what is going on today, and has been the practice of the common carrier ever since the inception of television. This same procedure has been experienced by a great number of broadcasters. I have talked to dozens of broadcasters.

Senator PAYNE. You happen to come from North Dakota, but I have a close personal friend of mine who is a broadcaster in the State of Maine, which is quite far removed, and I know he ran up against the same situation.

Mr. BOLER. I see. Well, we have a petition on file with the FCC to amend part 4 of the Commission's rules governing television auxiliary stations, which, if adopted, would stop some of this flagrant abuse by A. T. & T. It has been on file since August 1954, but has not been adopted. We have been advised that the FCC has this petition under active consideration and I ask your help to get action on this. (See exhibit 2, p. 992.)

Attached you will find a schedule of our payments to A. T. & T. which shows payments over a period of 21 months totaling $234,996.34. Attached find a letter from my competitor, WDAY–TV Fargo, indicating they have paid A. T. & T. $204,000 during the same period of time, and we are served by A. T. & T. from the same facilities. (See exhibits Nos. 3 and 4, pp. 994 and 995.) Payments to A. T. & T. over this period of 21 months total $439,000. The A. T. & T. investment in facilities to serve us, we believe, is less than $500,000. In other words, A. T. & T. is recovering its total investment in 3 years or less. I wish this committee would subpena the records and confirm the actual investment.

Our payments to A. T. & T. represent 18.7 percent of our total operating cost. Our gross sales for 1955 for KXJB–TV were $523,000 and we paid A. T. & T. $124,000. For the same period we suffered a loss of over $130,000. If we had been authorized to install our own microwave system, our operating costs to date could have been reduced approximately $100,000 and our loss reduced to the amount normally experienced by any new television operation. We can install our own microwave system for less than $200,000 and maintain it at a maximum cost of $42,000 per year, or 30 percent of A. T. & T.'s tariff. This includes depreciation, service, parts, insurance, and two full-time engineers to service the equipment. (Details shown on exhibits 5 and 6, pp. 995 and 996.)

I have no right to expend the money demanded by A. T. & T. to bring live television service into North Dakota. The public, however, has the right to expect the same television service in North Dakota as is available in Washington, D. C., or any other place. They want to see President Eisenhower and the world series and other outstanding events—and they are entitled to this service.

This is the realization of the FCC Priority No. 1, Sixth Report and Order, of providing "at least one television service to all parts of these United States."

A clear-cut policy on licensing of such private facilities is necessary to accomplish this goal of the FCC. The FCC should be the agency that determines whether duplication of facilities by the common carrier and private enterprise is justified in the instance of financial hardship, and not A. T. & T. The broadcasters are capable of operating, maintaining, and providing quality service. Provisions in the rules for private relay systems to serve the remote areas should effect a more desirable concentration of common-carrier facilities on main trunk and branch lines with resulting economies to all. The common carrier would not be forced to maintain its rates to cover risk capital which might be lost if smaller market stations enter into, or, I should say, are forced into, economically unsound contracts with the common carrier.

We understand that one of the reasons the FCC has delayed acting on our petition to amend the rules, or its primary concern, is "economy of frequencies." We do not believe that this argument or contention of A. T. & T. is applicable to relay facilities that would be licensed for a single user. Privately owned facilities would not require greater band widths, according to our engineers, and no additional channels would be required. The use of existing allocated intercity and STL channels would be adequate for this service.

Everyone knows that the growth of television is related to economics. If a television station is located in the area of existing carrier network routes, economy may determine the use of the common carrier. The farther away the station is from the major market the higher the connection cost. Common-carrier rates, we understand, are based on averages, and when they are trying to reach areas like North Dakota it may even affect the average rate formula.

If provisions for privately owned relays are adopted by the Commission, the matter of getting the service into smaller markets can be assumed by the broadcaster, and at a rate that he can afford.

Privately owned systems will not jeopardize the common-carrier service. If the common carrier can provide service or instant communication to three-fourths of the Nation's population now in case of a national emergency, privately owned relays could supplement this same service to a large portion of the population not now served. This would include normal daily service as well as emergency service which otherwise would not be available for many years to come.

Now, A. T. & T. maintains that the off-the-air pickup, which service it now offers, is the solution to all of the small television broadcasters' problems, but it is not. (See exhibits Nos. 7 and 8, p. 998.) I know from personal observation that the off-the-air installation made by A. T. & T. for one of my competitors in North Dakota is very unsatisfactory, and they have been operating the system since October 1955, and that broadcaster has constantly complained to A. T. & T. They deliver a bad picture and they have numerous outages. A. T. & T. is charging this station approximately $4,700 per month, even though the broadcaster furnished the tower and buildings to A. T. & T. specifications. This broadcaster could have put in his own system, were he allowed to, and could have maintained it for $1,000 to $1,200 per month and have had a much better quality service.

I know of another installation made by the telephone company for a broadcaster in South Dakota where an off-the-air service is being used. I talked to this broadcaster on the phone before I left home and asked him if he was pleased with his service. He said that he was having a miserable experience with it. One thing he pointed out in particular was the service. When they have a failure, A. T. & T. contracts allow them 2 hours to get an engineer to the location. He has had a tremendous number of outages and a substantial loss of air time. A. T. & T. told him a standby generator was needed and it would take them 6 weeks to put it in to cut down the outages by power failure. He advised them that he could not wait 6 weeks or tolerate these outages, and that he could have a local company put in a standby unit and could do so within 48 hours, but the phone company would not allow him to do it. He is now demanding that A. T. & T. put in TD–2 type equipment instead of the type of equipment used, because losses by power failure were only a part of the trouble.

These two examples of A. T. & T. off-the-air service point up several things. A. T. & T. charges for its off-the-air pickup service are exorbitant for the quality of picture and the service given. (See exhibit No. 9, p. 999.) It is 65 to 70 percent of their charge for first-class service. Further, as to the service, the broadcaster could install a system and have attended service of a staff engineer of his own system at a cost of 50 percent of A. T. & T. tariff for their unattended service off the air.

It is not in the public interest to restrict the opportunity to provide off-the-air service to A. T. & T. when, where, as, and if it decides it wants to and/or has the right to provide it, as the case is under the present regulations.

The Commission rules should be amended to give the FCC discretion to grant applications for private television intercity relay stations or off-the-air pickup notwithstanding the fact that the common carrier facilities may be available. This would encourage a more completely satisfactory solution to dozens of broadcasters' problems in practically every State in the Union, including UHF stations. Such a rule, properly administered, would not jeopardize the A. T. & T. network nor impair its ability to—

> meet the requirements of the television broadcast industry for network transmission facilities.

The FCC recognizes that in order to exist, a television station must provide live programing, must interconnect with network facilities or with other television stations. This procedure is economically feasible, however, only if interconnection charges are consistent with the station's revenue. We cannot exist if our payments to A. T. & T.

continue to be 18 to 20 percent of our total operating cost. I repeat, I paid A. T. & T. $124,000 in 1955, and our gross sales were $523,000 and our operating loss was $139,000. We could have and should have had our own microwave system, and if we did we could have saved at least $100,000. (See A. T. & T. contract attached, exhibit No. 1.)

Our petition to the FCC, filed in August 1954, to amend part 4 of the Commission's rules and regulations governing television auxiliary broadcast stations (Docket No. 11164) has the support of more than 70 broadcasters from different areas of the country, as evidenced by their comments filed with the FCC. I understand CBS, NBC, and ABC have also filed supporting comments. The Radio-Electronics-Television Manufacturing Association has filed supporting comments, and I wish to quote a synopsis of the conclusions of Mr. McDaniel, president of the Radio-Electronics-Television Manufacturing Association:

> RETMA believes the success of the Commission's proposed extension of television service to remote areas through low power, relaxed rules, and satellites depends upon two basic factors. First, ability of industry to develop adequate equipment economically within the resources of smaller communities, and, second, the ability of such communities to receive and rebroadcast, at low cost, network and other live programs. One cannot succeed without the other.
>
> Delay in establishment of effective rules covering the subject matter of this proceeding will prevent full realization of the Commission's plan of extension of television service to remote areas, utilization of the UHF frequencies, and the establishment of a nationwide competitive television service.

Now, A. T. & T. has vigorously opposed our petition to change the rules on the basis that their "off-the-air pickup service is the solution." Incidentally, at this point I would like to add that they did not come out with this off-the-air pickup proposition until a few months after we had filed our petition to change the rules. Then, and not until then, did they try to figure out some camouflage to supposedly solve our problems.

I refer you to the installations it has in North and South Dakota that contradict their theory. This so-called new and cheaper interconnection service furnished by A. T. & T. is subject to limitations specified by A. T. & T., and not by the Commission. Presumably, the decision to furnish cheaper service would be at the discretion of A. T. & T. and it would be provided only in the absence of other facilities. Although the proposal of A. T. & T. is not specifically described as a common-carrier service, the right to provide it in practical effect would be restricted to A. T. & T. Each channel furnished would be at the exclusive service of a single customer.

A. T. & T. does not want the FCC to have the discretionary authority for use in intercity television relay situations in which present policies of the proposed cheaper A. T. & T. service may impose a prohibitive economic burden upon the particular broadcaster. Under the present FCC rules, there is no provision for the FCC to determine whether a cheaper service should be furnished in any particular situation. In A. T. & T.'s proposal for off-the-air service, there is no criteria for use by A. T. & T. in making a decision as to who can or who cannot have this so-called utility grade service offered by them. A. T. & T. is well aware of the tremendous hardship caused North Dakota Broadcasting Co. by the cost of service provided by it between Fargo and Minneapolis, but it has done nothing about it, except to extend us time when we cannot pay the bill. It admits that the off-the-air service is no solution to our problem. As long as other stations in tandem also do off-the-air pickup from our facilities—at this point I would like to explain what I mean here. We have two additional television stations in North Dakota beyond our pickup point from A. T. & T. And these two stations are currently taking off-the-air pickup from our big station and thereby preventing us from doing an off-the-air pickup out of Minneapolis. In other words, if we do one off-the-air pickup, the A. T. & T. admit themselves that a second or third off-the-air pickup is not practical, technically.

Mr. Cox. This off-the-air pickup service that you provide to your stations in Minot and Bismarck is a private system?

Mr. Boler. A private system that we have installed; that is right.

The Telephone Co. admits that the first long hop (213 miles) between Minneapolis and Fargo must be a direct connection on a city-to-city basis. They have quoted us a tariff of $16,130 per month on a minimum contract of 3 years, and termination charges totaling $274,395, with no guaranty of performance of the equipment. (See letter attached from A. T. & T. and letter dated August 31, 1955, p. 3). A. T. & T. has now withdrawn this offer and agrees that tandem operation is not technically possible.

The determination as to whether we should be forced to take service from A. T. & T. or be allowed to operate our own microwave facilities between Minneapolis and Fargo should be made by the FCC and not the common carrier. Evidence shows A. T. & T. lack of interest in a broadcaster's financial problems due to its high tariff, and if a broadcaster attempts to obtain permits for private facilities A. T. & T. shows an arrogance that could only come from management of a moponoly which is not properly controlled, primarily because the rules and regulations make control impossible.

We are not attempting to undermine the sound Commission policy regarding protection of the common carrier's role of providing long-haul, through route service to several customers simultaneously. We agree that A. T. & T. should maintain the backbone service coast-to-coast, and branch service into important tributaries such as Minneapolis. The television stations along these routes have advertising rates from $1,200 an hour to $6,000 per hour, and their revenue from the networks and advertisers far exceeds the sum paid to A. T. & T. I am talking about television stations like ours. Our largest station went on the air in August 1954, with a network rate of $150 per hour, but we still were forced into A. T. & T. service by our competitor. The first 4 months we took in $15,000 from networks and we were billed for over $40,000 by A. T & T. Incidentally, that $40,000 doesn't include the expediting charge. In the ensuing 12 months we received from networks $70,000 and were billed $124,000 by A. T. & T. The largest city in our area is Fargo, with a population of less than 50,000 people.

A. T. & T. is not using the installation serving us for any other purposes to the best of our knowledge. The city-to-city service between Minneapolis and Fargo is a dead end link. FCC should be in the position to license private enterprise in situations like this.

In our attempt to establish television in North Dakota we have suffered a loss of over $400,000. We expected to lose some money, but we did not expect to have to pay A. T. & T. $234,996. With the discretion in A. T. & T.'s hands, it is obvious that it does not care whether a community has service or whether a broadcaster goes bankrupt attempting to establish the service. Its interest is primarily in paying its dividends so that it can do billions and billions of dollars of new financing. I have over 400 stockholders who have not had a dividend in 2½ years. They are entitled to dividends too, whereas, instead of receiving dividends, their investment has been jeopardized by A. T. & T. forcing its service and its tariff on us. I would like to add that those 400 stockholders are citizens of the State of North Dakota only. They invested their money with North Dakota Broadcasting Co. because they were interested in seeing television brought to North Dakota. Therefore, they invested with us to accomplish this purpose. As I say, when they invested the money we had planned to put in a private relay system, we had our budget setup planned on that basis, because of A. T. & T.'s statements that they were interested, and so forth. Actually, our stockholders invested with us on the basis of planned operation at that time. And then at the last minute we were forced into taking A. T. & T.'s service. We had invested some $650,000 in the station anticipating immediate live connection with a network. And then our competitor had to—he had no plans for putting in a private system—so when A. T. & T. came up with this proposition, they immediately grabbed it, because they knew we would either get a permit, which was on file—so we were actually forced into it.

If you will give George McConnaughey, FCC Chairman, a sufficient appropriation to allow him to hire a staff of experts, including accountants, engineers, and economists, who will make a thorough investigation of A. T. & T. tariffs and its business practices, it is my firm belief that the FCC will give the broadcaster the necessary relief from the present exorbitant tariffs.

In the meantime, I beg of you to call upon the FCC to act on our petition to amend the rules (docket 11164) so that we and other broadcasters can live during this interim of investigation.

(The exhibits referred to are as follows:)

Description of Exhibits Attached

1. A. T. & T. letter of agreement dated July 20, 1954.
2. Copy of petition to amend rules.
3. Schedule of payments made to A. T. & T. between October 1954 through June 1956.
4. Letter from WDAY–TV re payments to A. T. & T.
5. Estimate of installation and operating cost of private system between Minneapolis and Fargo, N. Dak.
6. Letter to Hon. Warren Magnuson re private microwave operating cost.
7. Letter from A. T. & T. March 10, 1955, giving quotations and contract conditions re Off-the-Air.
8. Letter to A. T. & T. requesting Minneapolis-Fargo off-the-air tariff, and clarification re "tandem" operation.
9. Letter from A. T. & T. advising that "tandem" off-the-air operation is not possible.

EXHIBIT No. 1

AMERICAN TELEPHONE & TELEGRAPH CO.,
LONG LINES DEPARTMENT,
Kansas City, Mo., July 20, 1954.

Mr. JOHN W. BOLER,
President, North Dakota Broadcasting Co., Inc.,
Hampshire House, Central Park South,
New York, N. Y.

DEAR MR. BOLER: This is to confirm our telephone conversation of July 19, 1954, during which I told you that we were still willing to uphold the commitment made to you on May 27 by Mr. Botkin of our company that we could provide 2 channels from Minneapolis to Fargo by the latter part of September, and that the $22,000 charge for expediting the construction would cover the cost of providing 2 channels.

On this basis, the special charge to you would be $11,000 for providing a channel for your exclusive use by the end of September 1954, and it is my understanding that you are willing to pay the special charge in order to obtain service at that time.

Monthly service charges to you will be approximately $8,825 per month for the video service and $1,371 per month for the audio service, making a total of about $10,200 per month, in accordance with our present filed tariff rates.

The above quotation contemplates 8 hours per day contract service for the video portion and 16 hours per day contract service for the audio portion. Service periods in addition to the 8 hours contract period for the video portion will be billed at the published tariff rates for consecutive and nonconsecutive hours.

I am forwarding two copies of this letter to you with the request that you signify your acceptance hereon and return one copy to me at your earliest convenience.

Yours very truly,

E. C. LAIRD, Jr.

Accepted, pursuant to notation below.

NORTH DAKOTA BROADCASTING CO., INC.,
BY JOHN W. BOLER, President.

JULY 23, 1954.

I accept the aforesaid terms under compulsion and duress and reserve the right to seek other means of securing service at a lower tariff.

JOHN W. BOLER.

EXHIBIT No. 2

BEFORE THE FEDERAL COMMUNICATIONS COMMISSION

Washington, D. C.

In re Amendment of Sections 4.631 and 4.632 of Commission's Rules and Regulations

PETITION FOR PROPOSED RULEMAKING

This petition is filed by North Dakota Broadcasting Co., Inc., permittee of television station KXJB–TV, Valley City, N. Dak. It requests the Commission to institute rulemaking proceeding to amend sections 4.631 and 4.632 of its rules to permit the grant of private intercity relay facilities on a case-by-case basis. In support thereof, the following matters are shown:

1. The Commission's rules (secs. 4.631 and 4.632) provide for grants of private intercity relay facilities only in the event common carrier fixed intercity video facilities are not available, and then upon an interim basis only, or until such time as common carrier facilities become available. Under the present rules a broadcaster is placed at the mercy of the common carrier as to whether he can get authority to operate an intercity relay, as to how long he may operate a private facility, and as to whether the license therefor will be renewed.

2. Petitioner is permittee of television station KCJB–TV, Minot, N. Dak., and KXJB–TV, Valley City, N. Dak., and is vitally concerned with the cost of bringing live television network shows to North Dakota residents. The closest point at which petitioner can interconnect with live network shows is Minneapolis,

Minn., a distance of approximately 550 miles from Minot and 263 miles from Valley City. The cost of common-carrier service over this distance at $41 per mile per month is such that petitioner cannot hope to bring live television network shows to North Dakota residents for an extended period of time by means of this service. The charge of $41 per mile per month is for 8 consecutive hours per day for the video portion and 16 hours per day contract service for the audio portion. Service periods in addition to the 8 hours for the video portion are billed at the published tariff rates for consecutive and nonconsecutive hours. If a broadcaster should desire network service for 8 nonconsecutive hours in addition to the initial 8 hours the cost would be $73 per mile per month, plus a connection charge of $1,060 per month, or a total monthly charge for a 263-mile haul in excess of $20,000 per month, if petitioner has correctly interpreted the tariff.

If a broadcaster is authorized to construct and operate a private facility, it will have no concern over nonconsecutive hours above the initial 8. It could easily carry 16 hours of network shows per day at less cost than it would have to pay for common-carrier facilities for 8 consecutive hours.

3. The population density of North Dakota, according to the 1950 census, was approximately 8.8 persons per square mile. The revenues which petitioner can reasonably hope to derive from television operation in this area cannot compare with that available to operators in the more densely populated areas of the country. If petitioner is to bring his viewers live network shows he must obtain them at a cost reasonably related to the broadcast revenues available in the North Dakota area. Petitioner is prepared to demonstrate on appropriate application that it can construct and operate a private intercity relay facility between Minneapolis and Valley City, N. Dak., at a cost of approximately one-half that of common-carrier service.

4. Petitioner respectfully submits that it is in the public interest for the Commission to amend its rules and regulations as herein requested to provide a more economical means of bringing live network shows to the less densely populated areas of the country, such as North Dakota, Idaho, Wyoming, Montana, and similar areas.

5. The granting of authority to television licensees to operate intercity relay facilities, on a case-by-case basis, where the need for such service is reasonably demonstrated, will not result in the inefficient and uneconomical use of spectrum space. This is especially true in the Minneapolis-to-Fargo area.

Section 4.602 of the Commission's rules provides 7 channels in the 2,000-megacycle band and 7 channels in the 7,000-megacycle band which may be assigned for use by television pickup stations, STL stations and television intercity relay stations. Four of the 7,000-megacycle channels are assigned to St. Paul-Minneapolis and three are assigned to Fargo, thus seven 2,000-megacycle channels are presently available for intercity relay assignment between Minneapolis and Fargo. This situation will obtain for the foreseeable future due to the thinness of the population in this area.

It should also be noted that one channel is needed to transmit a video signal whether on common-carrier frequency or television station-auxiliary frequency. The common-carrier channel which will handle one video signal will handle several hundred messages if devoted to message service use. It is apparent, therefore, that it is a waste of spectrum space to require a television broadcaster to use common-carrier service for intercity relay when seven television auxiliary channels are available and not used.

Petitioner is concerned about the present rules and regulations sought to be amended in that the Commission has tied its hands to the point where it has no discretion to grant authority to a broadcaster to operate a private intercity relay facility if common carrier service is available. In the Commission's letter of July 14, 1954 (FCC 54-880-8136-8320) to petitioner, after discussing petitioner's contention that it is not economically feasible for it to use A. T. & T. service between Minneapolis and Fargo, this statement was made (p. 2, line 22):

> "* * *, it appears that common-carrier service is available to you and, therefore, the Commission is unable to determine that a grant of your application would be *consistent with the provisions of the Commission's rules quoted above and its policies promulgated thereunder*." [Emphasis supplied.]

Petitioner respectfully submits that the Commission should amend its rules and regulations so that it can, where the facts warrant, grant authority to a television broadcaster to operate a private intercity relay facility, despite the availability of common-carrier facilities. The Commission should not be foreclosed in the exercise of its discretion in this matter. As the rules now provide, the television broadcaster in the rural areas must buy A. T. & T. service, pay a bonus for expediting the service if A. T. & T. has not planned to connect the points desired, regardless of the fact that A. T. & T.'s charges are absolutely prohibitive, and the Commission is impotent to act because of its rules and "its policies promulgated thereunder." Petitioner respectfully submits that if live television service with network programing is to be made available in the wide open spaces of the country the Commission must have the power and discretion, under its own rules, to grant authority to broadcasters in such areas to operate intercity relay facilities. Such action the Commission cannot now take without contravening the rules herein complained of. Such restriction upon its power prevents the Commission carrying out its statutory duty of rendering public interest convenience and necessity.

6. The suggested amendment to section 4.631 (c) reads as follows:

"Television intercity relay stations provide a means on an interim basis whereby television broadcast licensees may provide their own intercity television transmission services in connection with the operation of their television broadcast statons. Provided, however, that the Commission may grant authority to television broadcast licensees to operate intercity television transmission facilities where, in the opinion of the Commission, the cost of common carrier facilities compared to the cost of constructing and operating private intercity relay facilities justifies such action.

"This proviso is designed to permit the Commission, in its discretion, to authorize private intercity relay transmission facilities, to stimulate the development of live television network service in the less densely populated areas of the country."

Section 4.632 (b) amended to delete subparagraph (2) thereof.

Respectfully submitted.

North Dakota Broadcasting Co., Inc.
By D. F. Prince, *Its Attorney.*

WDAY Exhibit No. 4

WDAY, Inc.,
Fargo, N. Dak., July 11, 1956.

Mr. John W. Boler,
President, North Dakota Broadcasting Co., Fargo, N. Dak.

Dear Mr. Boler: In response to your request I have checked our records and find that we have paid A. T. & T. the following amount since inaugurating live television service: September 25, 1954, through May 31, 1956, $192,942.11. This amount represents payment for slightly over 8 consecutive hours per day of microwave service from Minneapolis to Fargo and includes charges for terminal connections and switching. Also we paid $11,000 to A. T. & T. for an additional "expediting" fee for them to advance their date for construction of the microwave facility from Fargo to Minneapolis. This fee represents half the cost for expediting that construction.

I would like, if I may, to pass along one additional comment: Our current contract with A. T. & T. specifies a minimum of 8 consecutive hours of service per day. Thus we are paying for service even though during that 8-hour period we program local news, weather, sports, or other public interest or public service shows. It would be much to the advantage of the public if we could take service of a minimum of 8 hours a day, but could spread the 8-hour period over, say 16 hours. In other words, eliminate the consecutive-hour portion of the 8-hour daily minimum contract. As it stands now, we are actually penalized if we use a nonconsecutive hour over and above the 8-hour minimum, inasmuch as the consecutive [sic] hour is charged at double the rate of a consecutive hour.

Sincerely,

TOM BARNES, *General Manager.*

EXHIBIT No. 5

The following data is based upon Philco equipment. Equipment prices are from the current listings or quotations. Operating cost is based upon estimates of the manufacturer and upon experience gained in operating long-hop microwave relays. This particular microwave layout between Minneapolis and Fargo is based upon a survey made by Philco Corp., which calls for a nine-hop system. Such a system would be comprised of 1 terminal transmitting station and located on the Foshay Tower in Minneapolis; 8 repeater stations, 1 terminal receiver station located at Fargo, N. Dak.

The cost of the various stations would be as follows:

Terminal transmitting station

Transmitter	$6,825
Parabolic dish	415
Voltage regulator	175
Waveguide	96
Installation cost	400
Total	7,911

Receiver terminal

1 receiver	$4,800
Waveguide	48
1 parabolic dish	285
1 voltage regulator	175
1 8-by-12-foot reflector	420
Installation cost	300
Total	6,028

Receiver station

1 receiver transmitter receiver	$10,500
Waveguide	96
2 parabolic dishes	570
1 voltage regulator	175
2 8- by 12-foot reflectors	1,080
1 8- by 12-foot building	1,205
Installation cost	300
Total	13,926

Towers

Cost of 8 towers, erected	$26,000

(Towers consist of two 260-foot, two 200-foot, one 130-foot, one 110-foot, one 100-foot, and one 70-foot.)

Summary of installed cost

1 transmitter terminal	$7,911
1 receiver terminal	6,028
8 towers	26,000
8 receiver stations	111,408
Total	151,347

In arriving at monthly operating cost, it is assumed there would be 2 maintenance men permanently assigned to the system and 1 man on a part-time basis assigned to the transmitter terminal station. Car expense is figured at 7 cents per mile; and tube cost, which is included in repairs and maintenance, is based upon a tube life of 15,000 hours which the Philco Corp. states is a conservative estimate.

Monthly operating cost:

Labor	$775.00
Car expense	152.00
Repairs and maintenance	710.00
Power	200.00
Leases and rentals	300.00
Total	2,137.00

Annual cost of system:

Operating cost	$25,644.00
Depreciation	15,134.70
Insurance	1,160.00
Total	41,938.70

COMPARISON OF COSTS: A. T. & T. VERSUS PRIVATE RELAY SYSTEM

The KXJB–TV contract with the American Telephone & Telegraph Co. calls for a monthly cost of $10,500 per month for 8 continuous hours' daily service. For overtime service over and beyond 8 hours, the extra charge is $51 per hour.

It has long been the desire of KXJB–TV to extend network service to 15 hours daily Monday through Friday, with the present hours on Saturday and Sunday. This would amount to 7 hours' daily extra service Monday through Friday, or 154 hours monthly additional service, which, at $51 per hour, $7,854 per month additional payment, or a total of $18,354 per month for service as outlined above.

This figure would run to $220,248 annually, as compared to the cost of operating a privately owned microwave system at $41,938 per year. There would be a savings of $178,310 annually in network costs. Reduced to percentages, the A. T. & T. annual charge would be 117 percent of the installed cost of a privately owned microwave system based upon 15 hours' daily operation Monday through Friday and 8 hours daily on Saturday and Sunday.

Additionally, the privately owned microwave system would be capable of operating 24 hours a day at the above-mentioned operating costs, which are figured on a 24-hour basis. This will allow pickup of special events at any time of day without special telephone or telegraphic orders being transmitted and without additional cost.

EXHIBIT NO. 6

FARGO, N. DAK., *January 23, 1956.*

Hon. WARREN G. MAGNUSON,
Chairman, Committee on Interstate and Foreign Commerce,
Senate Office Building, Washington, D. C.

DEAR SENATOR MAGNUSON: I note that your special committee has commenced hearings in connection with investigation of the radio and television industry.

I sincerely hope that the investigation will include A. T. & T. tariff for television program transmission facilities.

I have some information that may be of considerable interest to your committee in reference to the operating cost of private microwave systems. It consists of facts and figures which I challenge A. T. & T. to compete with.

We installed this system in October 1954, to transmit programs between Valley City, N. Dak., and Minot, N. Dak., a distance of approximately 180 miles. Airline distance between the point of origination (off-the-air from Valley City) and Minot, N. Dak., is 120 miles, and we use three microwave relay stations.

The installation cost of this system was $51,088.11.

The operating cost of this system for the 12-month period commencing January 1955 through December 1955, is as follows:

Salaries	$2,920.32
Traveling expenses	2,779.68
Tri County Electric Power	512.14
Verendry Electric Power	423.72
Insurance	338.85
Tube cost	2,720.40
Depreciation (10-year basis)	5,108.81
Total	14,804.14
A. T. & T.	67,440.00

You will note the average cost per month of operation for 1955 is $1,233.51. This facility enabled us to connect our 2 television stations which are a distance of 160 miles apart, and shows that our costs average $6.85 per airline-mile per month.

If you base the cost on the actual length of the system, which is 120 miles, the operating cost is $10.28 per mile per month. These costs are based upon an operating period which is unlimited, or 24 hours per day, as opposed to A. T. & T. tariff which is established on 8 hours per day. For the purpose of comparing these operating costs to A. T. & T., we submit a letter from A. T. & T., dated March 10, 1955, wherein A. T. & T. submitted a quotation of approximately $5,620 per month to give us a similar off-the-air pickup service between our Valley City station and our Minot station. We are unable to understand why A. T. & T. are allowed to charge a tariff of 400 percent greater for use of their facilities for the equivalent service, regardless of how de luxe their facilities may be.

The operating expenses of the private system which we have submitted herein, we will supply in affidavit form to your committee and we will submit it in maximum detail to the extent that we are confident that A. T. & T. will be unable to justify the tariff currently being charged.

We also invite your committee to designate an expert independent engineer whose testimony would be accepted by your committee and the FCC to come to North Dakota at our expense for the purpose of examining our system and examining our records.

Also enclosed find a copy of a letter from A. T. & T. dated August 12, 1955, wherein they set forth a quotation of "termination charges," were they to install a system to replace the private microwave, in which instance the termination charges that they request more than double total installation cost of the private system. While we operate our own private system within the State of North Dakota, we are still forced to contract with A. T. & T. for facilities between Minneapolis, Minn., and Fargo, N. Dak., to connect with the National networks. For this service we are forced to pay A. T. & T. approximately $11,000 per month, and we are unable to obtain licenses to operate a private system in this area because the present FCC rules will not allow a private system to parallel a common carrier. Our other alternatives would be to take the so-called utility grade service from A. T. & T. between Minneapolis and Fargo and for this service (off the air from Minneapolis) A. T. & T. have submitted quotations of $6,750 per month, plus an exorbitant termination fee of $105,215, were we to drop the service. The amount of the termination charge would be reduced monthly over a period of 36 months.

In comparison, we could install and operate a private system between Minneapolis and Fargo, N. Dak., at a cost of less than $2,000 per month, in comparison to A. T. & T. $6,750 per month.

In reference to the above, we again request your assistance to cause the FCC to act on docket No. 11164, a petition of North Dakota Broadcasting Co., Inc., for a proposed rulemaking to allow private television intercity relay systems, notwithstanding availability of the common-carrier system.

We will sincerely appreciate your consideration of the facts submitted herein, and we hope that the evidence is sufficient to justify drastic action on the part of your committee in reference to these problems.

Respectfully yours,

JOHN W. BOLER,
President, North Dakota Broadcasting Co., Inc.

EXHIBIT No. 7

AMERICAN TELEPHONE & TELEGRAPH CO.,

LONG LINES DEPARTMENT,
Omaha, Nebr., March 10, 1955.

Mr. JOHN W. BOLER,
President, North Dakota Broadcasting Co.,
Fargo, N. Dak.

DEAR MR. BOLER: This is to confirm my telephone conversation with your Mr. William Hurley on March 10, 1955, regarding the provision of the off-the-air channel offerings from your station KXJB-TV at Valley City, to Minot and Bismarck, N. Dak.

For an off-the-air channel from your station KXJB-TV to Bismarck, the monthly charge would be $2,660 and a minimum 3-year-term contract for $48,900 would apply with a provision for service within 4 months from date of order.

For an off-the-air channel to both Bismarck and Minot from your station KXJB-TV, the monthly charge would be $5,620 and a minimum 3-year-term contract for $104,000 would apply with a provision for service of 5 months from date of order.

The above off-the-air arrangement involves the pickup of broadcast signals (video and audio) at a receiver and the transmission of these signals to the customer at a distant location.

It is to be understood that the quality or reliability of this off-the-air channel will be of lower caliber than a combined audio and video channel now furnished under the standard tariff offering and utilized by the major network.

The design of the physical facilities, e. g., the type of equipment, the spacing between relay towers, and the location of the pickup point, will be determined by the telephone company, reflecting to the fullest extent practicable the customer's views in each case.

The provision of all facilities, including the receiving equipment at the pickup point, will be the responsibility of the telephone company; except that the provision of all station equipment and station wiring, other than that necessary for the suitable termination of the channel facilities at your transmitting site will be your responsibility.

No central office operation, monitoring, or supervision will be provided.

Emergency power arrangements will be more limited than those furnished with regular interconnected facilities.

Channels for both monochrome and color services will be available.

The channels will be furnished for your full-time use, subject to release for maintenance.

Reasonable diligence will be exercised by the company in restoring service in the event of interruption or failures; it is expected that you will recognize the probability of greater delays than experienced with the normal directly connected facilities. No credit will be allowed for interruptions of less than 2 hours.

You will be responsible for making all arrangements with stations, networks, or other parties for the necessary authorizations for this off-the-air pickup and use for rebroadcast of television program material, and the telephone company shall be indemnified and saved harmless by you from any liability arising out of failure to make such arrangements.

If you have other questions regarding this service, we will be pleased to discuss them with you.

Yours very truly,

ARTHUR V. HOLMAN,
Communications Engineer.

EXHIBIT No. 8

AUGUST 1, 1955.

Mr. E. C. LAIRD, Jr.,
Vice President, American Telephone & Telegraph Co.,
Kansas City, Mo.

DEAR MR. LAIRD: In accordance with our most recent conversation in Chicago on July 27, you have agreed to submit a new tariff quotation for the "off the air" utility-grade mircowave facilities for transmission of television programs from Minneapolis to Fargo, N. Dak. We would like to have this quotation include all of the terms and conditions immediately.

Will you also give us a quotation for facilities to extend the service from Fargo to Bismarck, N. Dak., and for further extension of service from Bismarck to Minot, N. Dak. In reference to these facilities, it is my understanding from information given to us by Vernon Holman, your district manager in Minneapolis, that "off the air" pickup in tandem is not practical; therefore, the facilities or service between Fargo and Bismarck and between Bismarck and Minot would have to be directly interconnected from city to city. If this is true, please give us the quotation for grade A facilities between Fargo, Bismarck, and Minot. If there is any alternative, please give us quotation for both grade A and utility grade service within the State of North Dakota, based on premise that we use "off the air" from Minneapolis.

It is imperative that we be advised when each type of service could be made available to us in all areas.

I recall that we made a request for quotation from one of your offices in a previous instance and you failed to submit the information for a period of 2 months. I trust that you will not find it necessary to delay submitting information requested herein. You have been apprised of our financial problems and it is important that we reduce our cost of "live" network facilities between Minneapolis and Fargo immediately. At the same time, we must know what alternatives we have to continue network service to Minot and to add our Bismarck station, which will go on the air October 1 of this year.

I will sincerely appreciate it if you can give me the information requested herein within the next 10 days.

Respectfully yours,

JOHN W. BOLER,
President, North Dakota Broadcasting Co., Inc.

EXHIBIT NO. 9

AMERICAN TELEPHONE & TELEGRAPH CO.,
LONG LINES DEPARTMENT,
Omaha, Nebr., August 31, 1955.

Mr. JOHN W. BOLER,
President, North Dakota Broadcasting Co.,
Fargo, N. Dak.

DEAR MR. BOLER: I believe that the attached diagrams will answer the questions covering charges for "off the air" television channels which were raised in your letter of August 26.

The television channels quoted in our letter of August 12 are shown schematically in figure 1. The signal of WCCO, Minneapolis, would be picked up at a point some 60 miles west of that city and carried by a 4-link microwave system to your Fargo studio. The charge quoted for this was $6,025 per month. To carry the signal to Bismarck from the tower immediately south of Fargo would require a 7-link microwave system. The charge quoted for this was $7,380 per month. To further carry the signal to Minot from a junction point near Woodworth (tower No. 5) would require a 3-link microwave system. The charge quoted for this was $2,725 per month. The physical junction of these channels at the tower south of Fargo and at the tower near Woodworth would be necessary since, as has been explained to you, an unsatisfactory picture would result from an attempt to take "off the air" a signal from KXJB which had been derived from an "off the air" signal from WCCO. Likewise an unsatisfactory picture would result from an attempt to take "off the air" a signal from KBMB which had been derived from an "off the air" pickup.

In engineering these channels, the route to Bismarck was so chosen that the addition of both Bismarck and Minot could be made at the lowest total charges to you.

The service quoted to KFYR is illustrated in figure 3. It provides for an "off the air" pickup of WDAY's signal. The pickup point would be near Valley City (tower No. 1) and a 4-link microwave system would be required to carry the signal to Bismarck. The relationship between charges of $7,380 a month for a 7-link addition to an "off the air" channel and charges of $4,640 for a 4-link "off the air" pickup and channel appear to us to be proper.

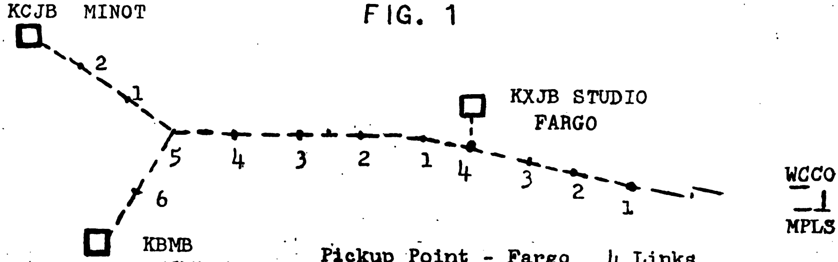
The quotation formerly made to you of $3,890 for an "off the air" pickup and channel to Minot covered the arrangement shown schematically in figure 2. The signal from KXJB would be picked up at a point near Woodworth (tower No. 1) and carried by a 3-link microwave system to KCJB at Minot. The difference between the charge for this pickup and channel and the charge for the extenison channel to Minot as shown in figure 1 is occasioned primarily by the fact that in the latter case the tower near Woodworth would be already in existence as part of the Bismarck service. Taking this into consideration the relationship of the charges of $3,890 and $2,735 appears to be proper.

Yours very truly,

L. L. GADDIS.

(The attachments referred to follow:)

FIG. 1

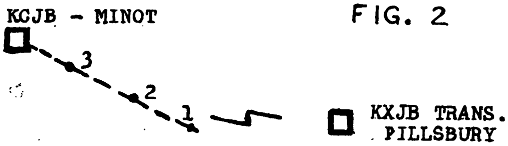


Pickup Point - Fargo 4 Links
$6,025 per month

Extend to Bismarck 7 Links
$7,380 per month

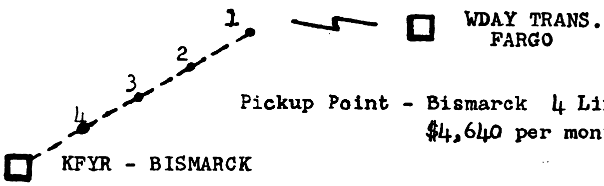
Extend to Fargo 3 Links
$2,725 per month

FIG. 2



Pickup Point - Minot 3 Links
$3,890 per month

FIG. 3



Pickup Point - Bismarck 4 Links
$4,640 per month

Mr. BOLER. I thank you sincerely for allowing me to present this statement.

Senator PAYNE. Do you have any questions? Yes, Mr. Boler.

Mr. BOLER. If I may, I would like to read the highlights of this rule change that we have. The present FCC regulation reads as follows:

Television intercity relay stations provide a means on an interim basis whereby television broadcast licensees may provide their own intercity television transmission service in connection with the operation of their television broadcast stations.

The provision for this service is a purely temporary measure, designed to assist the television industry until such time as adequate common carrier facilities are available. And the broadcaster who ventures into the business of relaying television programs by means of television intercity relay stations should plan to amortize their investment at the earliest possible date.

Now we would like that all amended to read as follows:

Television intercity relay stations provide a means on an interim basis whereby television broadcast licensees may provide their own intercity relay television transmission service, in connection with the operation of their television broadcast stations. Provided, however, that the Commission may grant authority to television broadcast licensees to operate intercity television transmission facilities where, in the opinion of the Commission, the cost of the common carrier facilities compared to the cost of constructing and operating a private intercity relay facility justifies such action.

This proviso is designed to permit the Commission, in its discretion, to authorize private intercity relay transmission facilities, to substitute the development of live television network service in the less densely populated areas of the country.

Senator PAYNE. That is "stimulate" instead of "substitute"?

Mr. BOLER. "Stimulate," I'm sorry.

We are operating a private relay system within the State of North Dakota, taking service from our station at Valley City to Minot, 183 miles away, and we have a similar installation serving our Bismarck station. We have been operating the Minot off-the-air pickup relay now since October 1954. In 1955 we kept a very accurate record of the operating cost of this relay system and found that our average cost per month was $1,248. This information is contained in an exhibit here in the form of a letter that I wrote to Senator Magnuson. A. T. & T. gave me a quotation of $5,900 a month for a similar off-the-air service to Minot.

Now that is the difference between their tariff and what we can actually operate our own system. And we can provide, ourselves, a better quality service than A. T. & T. does. We have proven that.

Senator PAYNE. You can provide it 24 hours a day whereas they provide only 8?

Mr. BOLER. That is right, they provide only 8.

Now, if A. T. & T. even knocked off the 8 hours' minimum service charge, and at the present tariff allowed 24-hour service, that would be some relief. I mean if we wanted to open up at 7 o'clock in the morning, which we would like to do in October, and take service—take network service—our bill to A. T. & T. would be $15,000 to $16,000 a month; whereas now even opening up and taking network service as early as 10:30, it has gotten up to—in February it was $14,000. And we simply cannot afford to take network service earlier in view of the tariff.

Senator PAYNE. In other words, what you are asking for is consideration to be given, very similar to that which an individual enjoys.

Let's assume that a utility, a water company, is furnishing water service in a community and their mains end at a certain point. The individual who is building, let's say, a mile from the end of that point wants service. But the cost of putting that service from the end of that installation out to your installation has to be measured against whether or not you can drill and establish your own system of providing water at a more reasonable rate than what the utility would have to charge you for putting the line out, amortizing the cost over a period of time, and the service that goes with it.

Mr. BOLER. Yes.

Senator PAYNE. Isn't it somewhat similar?

Mr. BOLER. It is somewhat similar to that. I would like to describe it in a different way.

The number of customers at the other end of that line would have a bearing as to how much the tariff can carry to bring the service out there. Now our problem in North Dakota is that the total population of the State is some 660,000. The national advertiser is never going to pay any more than a certain number of dollars per thousand television homes.

We probably have the longest hop between cities—intercity system, between Minnesota, or Minneapolis and North Dakota—of any place in the United States. And then on top of that—I mean when you get out there, if there was a couple of million people that would be something else again, but instead of that you have that tremendous long haul and when you get out there you have a limit to the circulation that we will ever be able to develop. I do not feel like operating television stations for the benefit of the A. T. & T. and the stockholders.

Actually, the people in North Dakota are not only entitled to service but they are entitled to a return on their investment.

Now A. T. & T. are actually hiding behind this FCC rule now. I mean they hide behind it—they do not come up with a proposition to give service, because they do not have to. The FCC rules: We cannot parallel. I will just bet you cannot find a broadcaster that ever has gotten a letter out of A. T. & T. in reference to whether or not they would give them service, and so forth. So this rule change, No. 1, I think would certainly have an effect as far as A. T. & T.'s—what I call their arrogance right now. In other words, if a broadcaster is in business—I have been in business in radio and television now, all told about 25 years. And the problem in North Dakota has always been the A. T. & T. charges as far as radio is concerned. I mean we have to pay $910 a month, for example—our Minot station has to bring CBS network service from Jamestown to Minot, $910 a month. This is for class C service, not class A service. We cannot get good quality from a symphony when it is on, because it is their cheaper service. So it has been our problem in radio, but of course it is 10 times with television because their tariff is that much higher.

Senator PAYNE. Any questions?

Mr. COX. Yes. When did you install your private relay system from Valley City to Bismarck?

Mr. BOLER. We put that in in the fall of 1955. We went on with it on the 19th of November 1955.

Mr. COX. Have your cost experiences there been comparable?

Mr. BOLER. Yes, they have. We use the same type of equipment and we have very few outages; and a comparison of our picture in

Bismarck to our competitor taking service from A. T. & T. is tremendously different. We have a beautiful picture on our system, on our own system.

Mr. Cox. It is a better picture than he is getting through their off-the-air system.

Mr. Boler. That is right. There are technical reasons for it. Actually, A. T. & T. didn't have any experience in this off-the-air pickup, and they are using a different type of equipment than they use in their normal installation.

Mr. Cox. Is the equipment that you use in your system comparable to that that they use in their interconnecting facilities?

Mr. Boler. Yes, they could buy the same type of equipment we have if they wanted to.

Mr. Cox. In your letter to Senator Magnuson of January 23, were the figures which you quote there for installation cost and operating cost only for the link between Valley City and Minot?

Mr. Boler. Yes; that is right.

Mr. Cox. Now, are the figures which you cite for the monthly charges of A. T. & T. for that service, or do they also include the service to Bismarck.

Mr. Boler. Oh, no, they are just for that service. They wanted another $2,700—$2,600 or $2,700 a month to feed Bismarck, if they were feeding Bismarck and Minot also.

There is one exhibit, the last exhibit, that is in here, the last page. It shows the telephone company's proposition when they were going to do an off-the-air out of Minneapolis, and then have it direct to Minot and to Bismarck. I believe that would explain it to you better than I can. It is the last page.

Mr. Cox. You attached to your letter to Senator Magnuson a copy of a letter of March 10, 1955, to you from Mr. Arthur V. Holman. I don't know whether that is an exhibit to your statement here. Which exhibit it that?

Mr. Boler. Exhibit 7.

Mr. Cox. Now, in that letter they quote a monthly charge of $2,660 for the service from Valley City to Bismarck; is that right?

Mr. Boler. That is right.

Mr. Cox. And then an additional charge of $3,890 for the service from Valley City to Minot?

Mr. Boler. Yes.

Mr. Cox. So that it is—those figures are the ones that would be compared, then, with your experience on your Minot service?

Mr. Boler. Well, yes; that is right. The $5,900 I referred to is if they were only serving Minot.

Mr. Cox. Only Minot.

Mr. Boler. Yes.

Mr. Cox. I see.

Mr. Boler. At that time, our Bismarck station, we didn't even have the permit. So that was prior to the time that we applied for our own permit to serve Minot. You see what they have done, as you will see on this map we have here; the reason for the difference in the cost where they are serving two stations, that they would branch off part way and go into Bismarck thereby cutting down the miles. That is the reason for the discrepancy in the figures.

Mr. Cox. You say something about the quality of your picture as compared to the service of your competitor in Minot. What have your respective experiences been on outages?

Mr. BOLER. Well, I would say that theirs has been 5 to 1 over ours.

Mr. Cox. Does this involve not only interruption of service to the public, but loss of revenue to the station?

Mr. BOLER. Yes, a very substantial loss of revenue.

Mr. Cox. As I understand their terms, unless this interruption lasts for 2 hours it does not, however, result in any reduction of the charge to you?

Mr. BOLER. That is right. They don't even have to give you any credit.

And the other thing: Without any guaranties as to service or quality or anything else, they demand a 3-year contract, with a penalty on cancellation, and that is reducible among the number of months of service. In other words, if you signed up with A. T. & T. and took their service for 6 or 8 months and then couldn't take it any longer for one reason or another, you would still have to pay the full 3-year contract.

Mr. Cox. After the 3 years has elapsed, however, that ceases to be.

Mr. BOLER. Yes; that is right.

In this letter from Holman—this same exhibit, March 10—they don't make any guaranties, or any commitments. I mean they decide everything. They even tell you what kind of buildings to put up, what kind of towers to put up, and everything else. I mean, it is completely one-sided.

Mr. Cox. How does the system which you proposed from Minneapolis to Fargo, which I understand you engineered——

Mr. BOLER. Yes.

Mr. Cox. Compare in terms of number of towers and the equipment to be employed with the system which the telephone company has actually installed?

Mr. BOLER. I believe they are currently using 7 relay stations and our proposal includes 9.

Mr. Cox. You actually have more stations?

Mr. BOLER. We would actually have more stations, that is right.

Mr. Cox. Now, is the equipment at each of those stations comparable in your system with that which they have in use?

Mr. BOLER. We don't know what they have inside of those buildings; what they are using now. That is why I say I would like to have you come out and see what is in the buildings. They are using the D–2 equipment, I presume, like they use on their main line. But they are just serving WDAY at Fargo, and ourselves. So the equipment that we would put in, I presume, would not be similar equipment they have now for their city to city.

Mr. Cox. Theirs is multichannel equipment?

Mr. BOLER. Yes.

Mr. Cox. Would your equipment be limited to serving just one channel?

Mr. BOLER. Yes; that is right.

However, manufacturers are talking about a traveling wave guide tube that may be put on the market within a matter of a few months wherein more than one network can be carried on this type of equipment. There are 2 manufacturers that are talking about a traveling wave guide tube that will actually carry 2 networks, and the cost is not too much greater than the present tube that is used.

Mr. Cox. At present, however, the system that you would propose to install between Minneapolis and Fargo would simply serve your station?

Mr. Boler. Yes; that is correct.

Mr. Cox. That would mean that WDAY, your competitor, would either have to install a similar system of its own or continue to bear the entire charge of the telephone company's tariff?

Mr. Boler. That is right, except if we were allowed to, WDAY management will join us and we will do like A. T. & T. We will put in the same buildings and same towers; put in an installation. We can do it cheaper as a matter of fact, and the management of the station have said that if anything can be done on this—you can get any relief—we will join you in establishing a system.

Mr. Cox. Have they supported your position in this proceeding before the FCC?

Mr. Boler. Yes. They have a letter in here giving me the information as to what they have paid the telephone company, and they are 100 percent behind it.

Mr. Cox. Do I understand that there is a channel available, according to your engineers, to provide this service for you between Minneapolis and Fargo?

Mr. Boler. Yes; there is.

Mr. Cox. Would that be true also of WDAY?

Mr. Boler. Yes.

Mr. Cox. What is the basis of your estimate of your installation cost, this engineering research that was done some years ago?

Mr. Boler. Yes. We know, we have got new prices. Our figures that we have submitted herein are current bids from companies now. There are two different companies that have facilities that would serve our purpose, and these prices are based on the present market price.

Mr. Cox. Do you have any basis for this estimate, I think you give here, of less than half a million dollars for the cost of A. T. & T. and the installation?

Mr. Boler. The only basis I have is that I have gone out and looked at one of their installations from the outside. They have two rows of wire fence around it like a concentration camp, and you cannot get any closer to it.

I can only go by the size of the building as to how much equipment can actually be in there. And the type of a tower that they use. We have no way of estimating the cost of the type of an antenna that they use—transmitting and receiving antenna that they use—because it is a privately manufactured one by A. T. & T. So our figures here are merely rough guesses.

Mr. Cox. Now, are the telephone company's rates to you based on the same air-mile rate as applied to other stations?

Mr. Boler. Yes; that is as we understand it.

Mr. Cox. In other words, you and WDAY pay a rate based on the mileage from Fargo to Minneapolis?

Mr. Boler. That is correct.

Mr. Cox. Multiplied by a rate which is more or less standard?

Mr. BOLER. That is correct.

Mr. COX. And the greater burden on this on your operations is occasioned by the combination of the distance involved and the low set circulation which you can possibly achieve in your area?

Mr. BOLER. That is right. The discrepancy in the amount that we paid—they paid $204,000 as against our $234,000—is that we had more network service in the morning than they did. In other words, we had to take more hours of service, and that is why we actually paid A. T. & T. more money because we got beyond that 8 hours. As a matter of fact, we took 11 hours of service.

Mr. COX. Now, when the Commission appeared before the committee, and were asked about this matter, I believe it was Commissioner Bartley indicated, of course, that they had some concern about the development of transcontinental common-carrier links for general use. Do you know whether the telephone company has ever indicated any plans, or any interest, in the establishment of a transcontinental link running west from Minneapolis through North Dakota, Montana, and into the Pacific Northwest?

Mr. BOLER. I think the installation, as it is with the addition of equipment, would accommodate other types of service. But at the present time, to the best of my knowledge, the only thing they have got in those buildings is the necessary equipment to serve television.

Mr. COX. They are not carrying any telephone circuits?

Mr. BOLER. As I understand they are carrying nothing more than the service to our two stations.

Mr. COX. So that substantially you bear the entire cost.

Mr. BOLER. That is correct, sir.

Mr. COX. Of the service.

Mr. BOLER. That is why I say, I would like to have someone come out there and actually examine that installation. They are getting the same tariff as they are between San Francisco and New York where they are carrying hundreds and hundreds of telephone messages and they have got an installation—maybe each installation cost them $150,000, but I know that these installations out there did not.

I don't want to get into the common-carrier business. I really don't. I mean I am all for the telephone company giving the service. But their attitude is entirely wrong, as a public utility with the protection they have to give public service. Their attitude is wrong, and the rules that exist now are not sufficient. There hasn't been an investigation for years of A. T. & T. And believe me, one is long overdue. I feel that if there was an investigation made that you would find a tremendous lot wrong with their whole tariff setup as far as television is concerned.

Mr. COX. I think the Commission testimony indicated that this proceeding involving the rates of the telephone company has been in the process for over 7 years.

Mr. BOLER. That is right.

Mr. COX. Without a determination. Although I believe they indicated yesterday that they expected to have some conclusions on that in the near future, and the same they said was true of your petition, or of the general proceeding, at least, with regard to private intercity relays.

Mr. BOLER. Those reports have been being made repetitiously over quite a long period of time. Now, I am not criticizing the FCC. I feel that it is lack of budget, perhaps.

Mr. COX. To the best of your knowledge, though, no one either in the industry or in the FCC is in a position to know what the installation costs or the operating expenses, properly attributable to the television services they are providing really are?

Mr. BOLER. To the best of my knowledge, that is the true situation—that is the situation.

Senator PAYNE. Unless you have something else that you would like to offer, we thank you very much indeed, Mr. Boler, for your statement and the information that you have given.

Mr. BOLER. Thank you very much for allowing me.

Senator PAYNE. Without objection there will be placed in the record a statement submitted by Miss Elizabeth A. Smart in behalf of the National Woman's Christian Temperance Union in support of Senate bill 825.

(This statement pertains to network regulation and is therefore printed in the volume on Network Practices.)

(COMMITTEE NOTE: For other testimony with respect to private intercity relays and A. T. & T. rates, see statement of Murray Carpenter, W–TWO, Bangor, Maine, which is printed in the volume of Network Practices.)

Senator PAYNE. And the record will remain open until September 25 for the introduction of any statements that anybody might wish to give before the record is complete.

And with the exception of hearings that may be scheduled with regard to legislation concerning political time, this will conclude the hearings at this time.

(Whereupon, at 11:21 a. m., the committee adjourned.)

APPENDIX

Additional Materials on Allocations Inserted Into Record in Later Phases of the Hearings

A number of letters and written statements relating to allocations matters were received by the committee and ordered inserted in the record during later phases of the inquiry concerning subscription television and network practices. These are printed in this appendix in order to bring them together with the other testimony and materials on the allocations problem. These materials are set forth below in the order in which they were inserted in the record. In each case the date on which they were thus inserted is shown, so that reference can be made, if desired, to the point at which they were actually received.

[Inserted on April 23, 1956]

Additional Testimony of Norwood J. Patterson, General Manager, KSAN Television Station, Channel 32, San Francisco, Calif.

In response to your question relative to the economic conditions imposed upon a station operator, should the Commission deintermix markets of the United States I would like to make the following comments:

Since the principal manufacturers of television transmitting equipment, General Electric and RCA, have millions of dollars at stake in the future of UHF television, I am confident that they would be very eager to operate as an intermediator between stations in exchange of VHF equipment for UHF equipment where the occasion requires under deintermixture and the opposite when such is required.

As an example we have received an agreement with the GE Co., wherein if under deintermixture San Francisco is made a VHF market that they will exchange used VHF equipment for our used UHF equipment, thus you can readily see that the GE Co. will have on hand used UHF equipment that they could again exchange to a station in a market where a VHF facility was taken out and made all UHF. Thus you can see that if the manufacturers, and I am sure that they would be glad to, would be an intermediator, they could exchange equipment between TV stations, thus not imposing an unreasonable economic situation on either manufacturer or the stations involved in deintermixture. Furthermore, I am sure that most television stations would be agreeable to paying a small charge to the manufacturer for reconditioning the equipment on an exchange basis. Thus you can see under this plan no adverse economic situation is presented upon any individual.

Statement of Louis Lubin, Chairman, Businessmen's Council of Americans for Democratic Action

I am Louis Lubin, chairman, Businessmen's Council of Americans for Democratic Action. I submit this statement on behalf of the council.

The Businessmen's Council of ADA is an organization of businessmen concerned with giving expression to the liberal point of view within the business community. We believe that there is a liberal view on the question of this

Nation's television policy. The views set forth in this statement represent a cross-section of the council's opinion and experience rather than the view of any individual member.

The present availability of usable television stations and networks is now wholly inadequate for free competition, and flexible use of this powerful advertising medium by smaller and medium size, as well as large, businesses. Advertisers must buy low-cost mass audiences in order for television advertising to be profitable. On this basis, the number of VHF stations with large audiences is so few that their time is largely sold out and their rates and terms are no longer determined by competition, which is essential to a self-regulating industry. There are only 12 markets in the United States with 4 or more stations, and only another 22 markets with 3 stations in the same VHF or UHF frequency band. Only 57 additional markets have a choice of 2 stations in the same frequency band.

This lack of usable stations has similarly limited advertisers' choice to only two live networks which can give reasonably adequate national coverage. These two networks are sold out of evening time. Like the stations, the networks have taken advantage of this shortage to inflate rates, take over control of programing by selling programs in forced combination with their time, improperly influence local affiliations, promote their film, talent, and station representative subsidiaries, etc.

These conditions have resulted in a very high concentration of television advertising usage by a relatively small number of very large businesses. These large advertisers are able to preempt preferred times, programs, and stations under highly favorable quantity discounts and terms of options and renewals with which smaller advertisers cannot compete. The net effect is that these few large television advertisers can buy advertising audiences in terms of cost per viewer per minute of commercial time that may be as little as one-tenth of the net circulation cost of smaller advertisers who can only secure small audience programs at high open rates.

We favor the restoration of free and open media competition as the only basic solution to this situation. In our opinion, there is need for at least 4 national live networks, supplemented by additional independent stations in the 125 largest markets.

We would first favor a high level study by the Congress of the present and future needs of advertisers as well as all other groups in the population. We favor the development of other forms of economic support for broadcasting, such as pay television, provided they will be assigned additional, exclusively licensed channels so as not to displace or restrict the growth of free commercial television.

In our opinion, it will require at least as many as the 70 UHF channels to provide an adequate television communication system for the total needs of business as well as other services. The ultimate gradual transfer of all broadcasting to the UHF band should be considered. As an interim measure only, we would favor deintermixture of the UHF-VHF markets, each on its own merits.

Finally, we deplore the fact that the Senate committee's ad hoc group of advisers does not include representatives of business, journalism, publishing, entertainment, education, social and political institutions, etc., who are actual or potential users of television, as opposed to its present makeup which is dominated by the representatives of the networks, and station owners who have large vested interests in maintaining the present scarcity of facilities.

We would appreciate it if this statement could be made a part of your committee's record in this matter.

[Inserted on April 23, 1956]

Statement of Dr. Edward C. Lambert, Director of Television of the University of Missouri

This Senate committee now has before it the perplexing and difficult problems of what legislation, if any, should be enacted by the Congress of the United States to assist in alleviating the difficult problems now confronting the television industry. The particular difficulties to which we refer are the financial and operational difficulties facing the ultra high frequency television stations.

The University of Missouri owns television station KOMU-TV, which operates on VHF channel 8 with 250-kilowatt power at a height above average terrain of 794 feet; the station is located in the center of the State, at Columbia, Mo. It is not the university's purpose or interest to take sides in the great dispute now going on between various segments of the industry, nor is it the university's position that UHF generally is not entitled to any relief. The university feels that the hearings being conducted by this committee should quite properly seek means of solving the difficulties of the UHF operators generally.

There are some disturbing suggestions, however, which are being made to this committee, suggestions which we at the University of Missouri feel are very shortsighted and improperly conceived. Specifically, we refer to the position of some UHF operators who urge that the coverage of all television stations should be limited to serving the principal community or possibly some undefined retail trading area around such a community. Part and parcel of this proposal is the plea made by some, that stations should serve almost solely as an outlet for local self-expression—indeed, that our entire television system should be nothing more than "hometown" television.

One group which expressed this view was the UHF Industry Coordinating Committee, through its chairman, Mr. Harold H. Thoms, on February 27, 1956. He specifically decried the development of "superpower, supermarket" stations and stated that stations with wide area coverage cannot serve the principal and primary purpose of a television station, namely, serving local needs. So also the Committee for Hometown Television, Inc., took a similar position, through its president, Mr. Philip Merryman, on February 28, 1956. It is interesting to note that both of these individuals, Mr. Merryman and Mr. Thoms, request that the solution to their own particular local problems is the assignment of an additional VHF channel, through a reduction in television station separations, thus permitting "drop-ins" of additional VHF channels.

It is respectfully suggested to this committee that the proposals of these groups constitute very serious threats to the development of a truly nationwide television service and overlook important considerations. The operation of station KOMU–TV by the University of Missouri, it is believed, points out the fallacies inherent in the position taken by such groups. The fallacy is this—there are a number of stations in the country which are specifically designed to afford wide area coverage so as to serve specific and important needs.

A brief description of the programs offered by KOMU–TV will be set forth here, so that this committee can get some understanding of the needs for area-wide service such as provided by KOMU–TV. Station KOMU–TV operates commercially, and it utilizes the proceeds received from its commercial programing to help defray the cost of operation and help to defray the cost of producing educational and other public-service programs. KOMU–TV is a network affiliate of the National Broadcasting Co. and the American Broadcasting Co. Knowing that the networks will explain and justify their position, we will concentrate here solely on describing locally produced programs.

KOMU–TV offers the usual news, weather, and sports programs around suppertime and also again around 10 o'clock each evening. From 5 to 6 p. m. daily, Monday through Friday, there is a program entitled "Time for Adventure," which is designed to entertain and also educate the youngsters. Also on Monday evening, there is a half-hour program entitled "Missouri Forum," which is a panel-type program featuring important public figures, including, among others, Senator Stuart Symington, Senator Thomas C. Hennings, Senator Hubert Humphrey, and Lt. Gov. James Blair. This program is specifically designed to reach as large an audience as possible and to bring before the citizens of the State of Missouri important and controversial issues, featuring the finest possible advocates representing all sides.

Also, once a month KOMU–TV presents Mizzou Riview, which is an hour-long "spectacular." Here again the purpose of this program is to bring entertainment and enjoyment to as many Missourians as possible and to acquaint them with the functions and activities of the university. Once a week, normally on Tuesday evening, the university presents a farm show, R. F. D., produced and presented by the university's college of agriculture and designed to bring information and education to the farmers and rural population of Missouri. On Wednesday evenings, KOMU–TV presents a program entitled "Not in Our Stars," which features an outstanding university psychologist dealing with current topics of interest to the adult audience. Also the station presents a weekly program entitled "Sewing Basket," a program designed to present sewing hints for the ladies.

Occasionally, KOMU–TV presents an afternoon musical program featuring an instrumental group from nearby Christian College. Right now, a series of afternoon programs are being produced for the League of Women Voters, the purpose being to educate the public as to voting procedure, and to introduce the personalities and issues involved in this election year. Later, a series of programs will be presented by the Internal Revenue Service for the purpose of educating the public on the proper procedure for filing of income tax forms. All of these programs are designed to reach as large an audience as possible.

Another program now appearing is the M. U. Farm and Home Show, which is produced by the college of agriculture and its extension division. The first half of this program is devoted to developing better farm practices and methods. The second half of the program is designed to teach both city and farm housewives the techniques of better living. In both of these cases, the university, through its extension service, accomplishes a major educational objective; but it can do so only by utilizing broad coverage television so as to reach the rural and small town population.

The use of television as a means of stimulating adult education and as a means of bringing interesting and educational programs into the home has not been fully developed by any means. The university is constantly experimenting with new techniques and further expanding its educational programing. For example, the university is now working on a project, whereby KOMU–TV will be originating 5 days a week, high school classes in Missouri history and plane geometry. These programs will be produced, if the project goes through, for the schools in 30 counties served by the station. The courses will be offered for credit in the participating schools, and also for credit to those interested in high school extension courses; they will be noncredit remedial courses for colleges throughout the area. Obviously, the use of television for such purposes, however, requires that the programs reach as many people as possible.

Of course, there are many other programs offered by KOMU–TV which are important to the State of Missouri and its citizens. Only a few will be mentioned, so as not to burden this record. The State conservation commission has a half hour program on Thursday evening, entitled "Sportsman's Club," which concerns various facets of the State's wildlife program. The university has a number of local activities which it televises on a regular basis. For example, every Friday night, the station carries the program Show Case. Each week a different university department or division is featured. This program shows the people of the State their university in action.

There are a number of special functions which occur during the year, which also are televised. For example, the entire university commencement exercise is carried. Also during March of this year, there will be an hour long student production, Savitar Frolics. Television offers a unique means of bringing this popular student program to the entire State.

These programs, as well as the regular features described above, constitute an important aspect of the university's efforts to discharge its educational objective. The university feels strongly that television affords a marvelous and unlimited medium for the discharge of the university's functions. Wide area coverage is essential to an effective utilization of the facilites and a corresponding effective and efficient accomplishment of the objectives. We are confident that this committee will carefully study the various programs and views presented to it. We are further confident that no unfortunate or ill-advised action will be taken, the effect of which will be to seriously impair the ability of station KOMU–TV to discharge effectively its educational objectives. Station KOMU–TV is but one station out of many which, in a unique way, is serving the needs of a large area. Wide area coverage is essential if such stations are to meet these compelling needs.

Statement of the Helm Coal Co., Permittee of UHF Station WNOW–TV, York, Pa.; Susquehanna Broadcasting Co., Permittee of UHF Station WSBA–TV, York, Pa.; Rossmoyne Corp., Permittee of UHF Station WVMB–TV, Harrisburg, Pa.; WHP, Inc., Permittee of Station WHP–TV, Harrisburg, Pa.; and the Patriot-News Co., Permittee of Station WTPA, Harrisburg, Pa.

Deintermixture of VHF and UHF channels to the greatest extent possible without disrupting existing television operations has been urged in very many of the comments and reply comments which have been filed in the Commission's general rulemaking proceeding. Most of the major organizations in the industry have endorsed deintermixture of one sort or another, including the American Broadcasting Co., National Broadcasting Co., Radio Corporation of America, Columbia

Broadcasting System, General Electric Co., Storer Broadcasting Co., Westinghouse, and General Teleradio.

The problems confronting UHF broadcasters are so well known to this committee that discussion would serve no useful purpose. In short, intermixture has not worked. It has not resulted in the development of a fully competitive nationwide television service. The south-central Pennsylvania area is an excellent example of the shortcomings of the practice of intermixture of VHF and UHF channels.

At the present time the vast south-central Pennsylvania area, consisting of 18 counties with a total population in excess of 2 million, and including the cities of Harrisburg, York, Reading, Lebanon, Lancaster, Chambersburg, Lewistown, Sunbury, Shamokin, and Hazleton, has 14 UHF allocations and only 1 VHF allocation, channel 8 in Lancaster. Six UHF stations are now on the air in the area—3 in Harrisburg, 2 in York, and 1 in Reading. Three other UHF stations were formerly on the air in the same area, but for economic reasons have been forced to cease operations. These are stations WEEU–TV, Reading (on air April 15, 1953, off air June 30, 1955), WCHA–TV, Chambersburg (on air September 3, 1953, off air July 14, 1954), and WLBR–TV, Lebanon (on air October 22, 1953, off air October 16, 1954). WLBR–TV hopes to resume operations under new management (as a satellite or quasi-satellite of VHF station WFIL–TV, Philadelphia). Three other UHF construction permits have been issued for the same area, one of which is still outstanding.

By far the greatest obstacle to the development of television as a medium of local expression in the south-central Pennsylvania region is the existence in that otherwise UHF-only area of a maximum power VHF television station, WGAL–TV. The history of television operations in the region discloses how the Commission's present VHF allocations and rules have been used—or more accurately "misused"—to place multiple UHF stations at an insuperable disadvantage in competing with a single, high-powered, regional VHF station.

Station WGAL–TV, in Lancaster, Pa., was fortunate enough to obtain a VHF assignment prior to the television freeze. Three of the five Harrisburg and York UHF stations and two Reading UHF stations were also applicants for VHF stations in their respective cities prior to the freeze, but unlike WGAL–TV were held up in their VHF applications because there were more applicants than channels in Harrisburg, York, and Reading. The present allocation plan, issued after the freeze, did not assign VHF channels to Harrisburg and York, thereby making it necessary for the Harrisburg and York stations either to operate on UHF or forego bringing television to their cities. VHF, however, was continued in Lancaster by moving prefreeze channel 8 from York to Lancaster for use by WGAL–TV. Originally WGAL–TV operated on channel 4 as a community station. In its sixth report and order which terminated the freeze the Commission proposed to shift WGAL–TV to channel 8 under a special temporary authorization, operating with a relatively modest power and antenna height from a site close to Lancaster. In connection with this change in frequency WGAL–TV filed an application for authority to increase its power and antenna height to the maximum permissible; that is, to 316 kilowatts and 1,000 feet above average terrain, and to change its transmitter location. This application was granted January 28, 1954, and WGAL–TV began operating with these new facilities on June 28, 1954. The new transmitter location of WGAL–TV was more than 15 miles closer to York, Pa., than its original transmitter site, almost 14 miles closer to Harrisburg, and more than 16.5 miles more distant from Lancaster. As the following table shows, the new operation of WGAL–TV resulted in a substantial increase in the strength of the signals which were received in York and Harrisburg, Pa.

Field intensities delivered to the most distant parts of cities from station WGAL–TV, before and after June 28, 1954

City	Before June 28, 1954	After June 28, 1954
York	56.2 dbu	104.0 dbu.
Harrisburg	48.1 dbu	90.8 dbu.
Lancaster	103.6 dbu	92.5 dbu.

It will be noted that the increased WGAL–TV signal is stronger in York than it is in Lancaster, and in Harrisburg it is only insignificantly weaker than in

Lancaster. It is also to be noted that with the increased power and height, WGAL–TV provides a weaker signal to Lancaster than with its old station, solely because it has moved its transmitter closer to York and Harrisburg so as to serve those cities.

It is clear that WGAL–TV's primary, if not sole, purpose in seeking greater power and greater height and a new location for its antenna was to establish an areawide coverage embracing Harrisburg and York, as well as other cities, rather than to improve its service to Lancaster. Advertisements of WGAL–TV in the trade press have emphasized that this was its purpose and intention. These advertisements include claims that WGAL–TV serves Harrisburg, York, Lebanon, and Reading as well as Lancaster. WGAL–TV boldly emphasizes that in addition to its entrenched position gained through 7 years of monopoly operation it has a service area far greater than that of any of its present UHF competitors in York, Harrisburg, and Reading. Perhaps the best evidence of the adverse effect which WGAL–TV, with its areawide coverage, has had upon UHF operations and growth is the fact that, since WGAL–TV has increased its power and tower height, 3 UHF stations in the area have been forced to sign off the air, and permittees of 3 other stations in the same area have never gone on the air.

WGAL–TV has a primary affiliation with NBC and a secondary affiliation with CBS. Because of its powerful signal and top network programs, well over half of the television homes in York are tuned to WGAL–TV during all time segments. The dominance of WGAL–TV in the York and Harrisburg markets, as well as in other south-central Pennsylvania markets, is precisely what the York and Harrisburg UHF stations predicted when on March 1, 1954, they filed with the Commission a joint petition for rehearing of the then recently granted application to move the WGAL–TV transmitter closer to York and Harrisburg and to make it a regional station by increasing antenna height and power. This joint petition was subsequently denied. *In re WGAL, Inc.* (10 Pike & Fischer R. R. 1209 (1954)).

With WGAL–TV operating as it does as a broad, regional station, the networks and their advertisers now have the opportunity of selecting merely one station to reach all of south-central Pennsylvania, instead of several UHF community-type stations in separate cities. For example, station WHP–TV, a CBS affiliate in Harrisburg, does not carry the following top CBS programs though station WGAL–TV does: Toast of the Town, Arthur Godfrey's Talent Scouts, I Love Lucy, and the Jack Benny Show.

The Commission has heretofore made allocations of television channels primarily to communities—not to areas and regions. Fundamentally, therefore, the assignment plan requires that a station primarily serve a given community, meet its local needs and be a source of local expression. In their joint petition for rehearing of the WGAL–TV grant, and also in their statement before the Potter committee, the York and Harrisburg UHF permittees pointed out that WGAL–TV's purpose in seeking greater power and tower height and a new antenna location was to establish areawide coverage embracing York, Harrisburg, and other cities, rather than to improve its service to Lancaster. The UHF stations also pointed out that the WGAL–TV grant severely limited the opportunity of UHF stations in the area to secure network affiliations and national spot revenue. Unfortunately, these predictions have been proved 100 percent accurate. Before the WGAL–TV grant, WTPA in Harrisburg had an NBC affiliation, which it has now lost to WGAL–TV. In fact, there is only one NBC affiliate in the entire York-Harrisburg-Lancaster-Lebanon-Reading area, WGAL–TV.

Channel 8 should be deleted from Lancaster, leaving south-central Pennsylvania a large, populous, UHF-only "island." Among the reasons for this move are the following:

(*a*) WGAL–TV could continue to operate on a UHF channel. Channel 21, allocated to Lancaster, is presently unassigned. Other UHF channels are also available.

(*b*) There would be little, if any, inconvenience to the general public resulting from the deletion of channel 8, since there is a high degree of all-channel set saturation in the entire area now served by WGAL–TV.

(*c*) There would be no television "white area" created by the suggested channel move, since all of the WGAL–TV grade A service area receives grade A service from at least one UHF station and since all of the present WGAL–TV grade B service area is within the grade B service area of at least one UHF or VHF station. All but the extreme southern and southeastern portions of the WGAL–TV grade B service area receive grade A or grade B service from one or more UHF stations, while the extreme southern and southeastern portions of the WGAL-TV grade B service area receive grade A service from VHF stations in Baltimore, Philadelphia, and Wilmington.

(d) If deintermixture is effected in south-central Pennsylvania, all UHF stations in the area will be able to compete on an equal basis for network affiliations and programs; local, regional, and national advertisers; for listeners; for syndicated film; for local talent; for news services; and for personnel.

(e) The deletion of channel 8 would encourage the now defunct UHF stations in Lebanon, Reading, and Chambersburg to return to the air. There would also be greater incentive to apply for and construct additional UHF stations in Hazleton, Lancaster, Lewistown, and Sunbury on presently available UHF channels.

[Inserted on May 15, 1956]

STATEMENT BY PLAINS TELEVISION CORP., LICENSEE OF UHF TELEVISION STATION WICS, SPRINGFIELD, ILL.

WICS, a UHF television station in Springfield, Ill., has been on the air continuously since September 17, 1953. On March 30, 1955, WICS filed with the Federal Communications Commission a petition for rulemaking looking toward the elimination of intermixture in Springfield, either by reserving for educational use the VHF channel allocated to that city (channel 2) or by the reallocation of channel 2 from Springfield to St. Louis, Mo., and the substitution of a new UHF channel in Springfield.

On November 10, 1955, the Commission dismissed some 35 deintermixture petitions without prejudice to their subsequent reconsideration on the merits in a general rulemaking proceeding ordered that same day. The WICS petition was not considered on its overall merits. The Commission, as Chairman McConnaughey told you on February 20, 1956, has not yet rejected deintermixture. WICS filed comments in the Commission's general rulemaking proceeding on December 15, 1955, and reply comments on February 8, 1956.

Deintermixture of VHF and UHF channels to the greatest extent possible without disrupting existing television operations has been urged in very many of the comments and reply comments which have been filed in the Commission's general rulemaking proceeding. Most of the major organizations in the industry have endorsed deintermixture of one sort or another, including the American Broadcasting Co., National Broadcasting Co., Radio Corporation of America, Columbia Broadcasting System, General Electric Co., Storer Broadcasting Co., Westinghouse, and General Teleradio.

The problems confronting UHF broadcasters are so well known to this committee that discussion would serve no useful purpose. In short, intermixture has not worked. It has not resulted in the development of a fully competitive nationwide television service. By way of example, WICS refers you to the Springfield, Ill., and St. Louis, Mo., areas with which it is very familiar.

At the present time, Springfield is allocated channels 2 and 20 for commercial use and channel 66 for noncommercial use. Channel 20 has been assigned to WICS. Channel 2 is presently the subject of a comparative hearing in which an initial decision was released December 3, 1954. Channel 66 has not been assigned and no applications for it are pending.

St. Louis is allocated channels 4, 5, 11, 30, 36, and 42 for commercial use and channel 9 for noncommercial educational use. Channel 5 has been assigned to KSD-TV, a prefreeze station which commenced operation February 8, 1947. Channel 4 is assigned to KWK-TV which went on the air July 7, 1954. Channel 9, the educational channel, has been assigned to KECT which commenced operation September 13, 1954. Construction permits are now outstanding for two of the UHF channels. The Lutheran Church—Missouri Synod—holds a construction permit for a station on channel 30 at Clayton, Mo., a suburb of St. Louis. This permit was granted February 4, 1953. Construction of the station has not been commenced. Missouri Broadcasting Corp. holds a construction permit for a station on channel 42 at St. Louis. This permit was granted February 11, 1953. Again, no construction has been undertaken. Channel 36 was assigned to Broadcast House, Inc. (KSTM-TV) which commenced operation October 20, 1953, but left the air August 3, 1954, and surrendered its construction permit on August 26, 1954. WTVI, a UHF station which once operated on channel 54 at Belleville, Ill. (within the St. Louis metropolitan area) has moved to channel 36 in St. Louis. One other UHF station has been in operation in the St. Louis vicinity. This station, KACY, which operated on channel 14 at Festus, Mo. (with transmitter within a few miles of St. Louis) went on the air October 31, 1953, but ceased operation April 2, 1954. The remaining VHF channel (11) in St. Louis is now the subject of a comparative hearing among four applicants.

WICS is a rarity, a successful UHF television station. Commencing operation September 17, 1953, it has worked diligently to promote UHF. It has succeeded to the extent that now 99 percent of the television receivers in Sangamon County, where Springfield is located, are capable of receiving UHF signals. Every set now sold in Springfield is equipped for UHF reception. Its programing is designed to appeal to every segment of its diverse audience of commerce, agriculture, industry, and Government. Each day WICS features local faces on the channel 20 screen and its facilities have been made available to virtually every public service organization in the area. Its local programs include a story time for children 2 to 6, a teen-age series, a farm program, shopping and household hints, kitchen tips, record potpourri, interviews, news, sports, and weather. It also televises a forum on religion in conjunction with the Illinois Church Council, a program of job opportunities in association with the Illinois State Employment Service, a documentary series in cooperation with the mayor's commission on human relations, recreation and hobby shows, and programs produced in cooperation with local educational institutions. Special events have included a cerebral palsy telethon (18 consecutive hours), Christmas parades, 4 hours of daily remotes from the Illinois State Fair, a series for the blind, fashion premiers, and salutes to local industry. Local shows in WICS's 14-hour daily schedule are, of course, built around a nucleus of top network and film attractions. WICS is a primary interconnected affiliate of the NBC–TV network, has a secondary affiliation with ABC, and carries, in addition, occasional CBS programs. The availability to WICS of popular network programs has, of course, been of great assistance in building a listening audience. WICS has also been fortunate in that it has faced limited VHF competition. As will be seen below, the majority of the WICS service area receives no grade A VFH service.

The experience of UHF stations in other markets the approximate size of Springfield shows conclusively that WICS could not have accomplished what it has if it had been operating in an intermixed market. While WICS believes that it deserves credit for the energetic way in which it has developed local programs and identified itself with its community in the mind of its audience, it recognizes that these efforts would have had to have been on a much smaller scale if it had not had substantial revenue available. Moreover, without its network shows as a nucleus, it could not have achieved a program schedule of sufficient length and quality to build an adequate UHF audience. The advent of a VHF station in the Springfield market may radically change the picture. Experience in other areas has shown that an initial head start is not sufficient to guarantee the success of UHF operations. Springfield, Ill., is a relatively small market. The population of the city is only 81,628 and of Sangamon County, 131,484. Markets of this size can successfully support two and perhaps three television stations if all are either UHF or VHF. In intermixed markets, however, the competitive advantage of a VHF station is such that it absorbs too large a proportiton of the total available advertising revenues to permit successful operation by the UHF station. It is evident, therefore, that if television is to remain healthy and competitive in Springfield, deletion of the yet to be assigned VHF channel and its replacement by a UHF channel are essential.

Deintermixture of Springfield will not only keep UHF alive in Springfield, and Sangamon County, but in more than a dozen other counties in central Illinois as well, thereby deintermixing an entire area, not merely a single city. Central Illinois is ideally suited for deintermixture. The VHF stations nearest to Springfield are WCIA, Champaign, Ill., approximately 75 miles distant; KSD–TV and KWK–TV, St. Louis, Mo., approximately 85 miles distant; KHQA, Hannibal, Mo., approximately 85 miles distant; and WGEM, Quincy, Ill., approximately 90 miles distant. In contrast, there are four close-by UHF stations, WTVP in Decatur, Ill., about 40 miles from Springfield, WBLN in Bloomington, Ill., 60 miles from Springfield, and WEEK and WTVH in Peoria, Ill., approximately 65 miles from Springfield. Further, if Peoria were also deintermixed, all of central Illinois would receive multiple service from fully competitive UHF stations. The overall result would be to make central Illinois an all-UHF area, with VHF service concentrated in the border Illinois, Indiana, Missouri, and Iowa cities; i. e., Chicago, Champaign, Terre Haute, Cape Girardeau, Hannibal, Quincy, Davenport-Rock Island-Moline, and Rockford-Beloit.

St. Louis, in contrast to Springfield, is a predominantly VHF market. Two commercial VHF stations are already in operation there—one since before the freeze—and a third VHF will eventually take the air. The noncommercial educational station in St. Louis is also a VHF station and provides no incentive for the purchase of UHF converters or all-channel receivers. Two UHF stations serving St. Louis have already succumbed to VHF competition. A third UHF station is hanging on temporarily but its demise appears inevitable when the third VHF station is established. St. Louis will thus be condemned to have no more than three television stations. This is inadequate for a metropolitan area of that size (population 1,681,281). The deletion of channel 2 from Springfield and its assignment to St. Louis will permit that city to enjoy four commercial television services.

If channel 2 is deleted from Springfield and removed to St. Louis, it may be concurrently assigned to the Terre Haute, Ind., area, which is now served by only one station, thereby providing a second service to Terre Haute as well as a fourth service to St. Louis.

STATEMENT OF TELECASTING INC., PERMITTEE OF UHF TELEVISION STATION WENS, PITTSBURGH, PA.

Telecasting, Inc., has been operating UHF station WENS, Pittsburgh, Pa., since August 25, 1953. It welcomes the opportunity to present its views, gleaned from almost 3 years of operating experience, to this committee.

At the present time, Pittsburgh, Pa., is allocated VHF channels 2 and 11 and UHF channels 16, 47, and 53 for commercial use and VHF channel 13 for noncommercial educational use. Channel 4 is allocated to Irwin, Pa., a town of 4,200 persons on the outskirts of Pittsburgh. Thus, for all practical purposes 3 commercial VHF's, 3 commercial and 1 noncommercial educational VHF are allocated to Pittsburgh. Of the three commercial VHF channels, channel 2 has been assigned to KDKA-TV (formerly WDTV), a prefreeze station which has been in operation since January 11, 1949. WWSW, Inc., has been granted a construction permit for station WIIC on channel 11, a grant on which a further hearing is being held. Channel 4, the other commercial VHF channel, is presently the subject of a comparative hearing. At one time grants were outstanding for all three commercial UHF channels. Two stations, WENS on channel 16 and WKJF-TV on channel 53, were constructed and went on the air in July and August of 1953. WKJF-TV ceased operations on July 2, 1954, and has not returned to the air. WENS understands that construction on the remaining UHF channel is unlikely, the permit having been outstanding for almost 3 years. Noncommercial educational station WQED, operating on channel 13, has been on the air since March 19, 1954. Thus, at the present time there are two operating commercial television stations in Pittsburgh, KDKA-TV which has pioneered VHF on channel 2 and WENS which has pioneered UHF on channel 16.

The initial application of WENS for a construction permit was filed September 29, 1952, when only 2 VHF and 3 UHF channels were allocated to Pittsburgh, and before an additional VHF channel was assigned to the nearby suburb of Irwin. The application was granted on December 23, 1952, and the station went on the air August 29, 1953. Its construction costs were in excess of $700,000. Its operating losses, as of the end of last year, were in excess of $400,000.

The programing of WENS has been attuned to meet the needs, desires, aims, and aspirations of the persons within its service area. It has established a reputation for television firsts in the area, marshalling an aggressive force for education, information, and entertainment programing. In 6 months time WENS completed more hours of remote telecasting—major sports and special events—than had been accomplished in the metropolitan area during the previous 5 years. WENS has telecast special sporting events from New York City and on occasion has provided originating service to a regional network consisting of both VHF and UHF stations. This was done at considerable cost in equipment expenditures and rights charges. It gave complete on-the-spot coverage of Pittsburgh's municipal elections in 1953, utilizing several remote crews. In May 1954, WENS remote crews climbed the city's rugged Mount Washington to carry a special program emphasizing the value of municipal smoke control. WENS inaugurated a full schedule of University of Pittsburgh and Duquesne University sporting events. It has also carried educational remotes featuring faculty members from these universities. One season its cameramen followed the Pittsburgh Pirates during their out-of-town games and sent back closeups of the hometown team. It has presented on a regular basis from its studios, news, sports, variety, panel, and religious programs designed to appeal to every taste. It has produced the Band Wagon in cooperation with the Allegheny County Board of Education, a program which has brought together in the WENS studios hundreds of teenagers. It conducted Way of the Cross, a half-hour special Lenten season series produced in cooperation with the Knights of Columbus. WENS has received letters of commendation in recognition of its service to the community from a vast number of religious, social service, and civic agencies. In short, WENS sincerely believes that it has worked diligently to become a vital instrument of local self-expression.

When the WENS principals applied for a UHF television station, they had confidence in the ultimate success of their operations. Since then, however, the basic VHF–UHF balance was changed. After making its original allocation for 2 VHF's and 3 UHF's for Pittsburgh, the Commission allocated another VHF channel to the town of Irwin, Pa., on the outskirts of Pittsburgh.

Competition which WENS faces from station KDKA–TV is a formidable obstacle to its success. During the years when KDKA–TV (then WDTV) was Pittsburgh's only station, the area became heavily saturated with VHF–only receiving sets. During the past year and a half it has become apparent that WENS is faced not only with this local competition but has been forced to compete with other VHF stations located outside of Pittsburgh. The substantial coverage advantages which VHF stations have by reason of their lower frequencies and more powerful equipment coupled with power increases permitted by the Commission's Rules have made it possible for VHF stations in Steubenville, Ohio, and Johnstown, Pa., to claim a saleable signal in the city of Pittsburgh. Their coverage claims have been sufficiently convincing to cause WENS to lose a number of valuable network programs to these out-of-town stations. These stations have carried advertisements in national trade publications devoted primarily to an exploitation of their coverage claims for Pittsburgh. Yet none of these out-of-town stations has contributed anything in the way of public service to the city of Pittsburgh and to its immediate environs. Their contribution is rather to extract advertising dollars from Pittsburgh to the detriment of a Pittsburgh UHF station.

Although WENS has done everything feasible to make its station a popular medium of public expression in its community, it has not been financially successful. UHF set circulation has been the chief difficulty in obtaining sufficient advertising revenue for the station. Diligent efforts to promote all-channel set circulation have met with very little success. The market is already near set saturation (now about 90 percent) with VHF-only sets, many of which were purchased during the 5 years before WENS went on the air. Further, during the last 2 years, instead of significantly increasing the number of all-channel sets, receiver manufacturers have been making fewer and fewer. The majority of converters have been found to be faulty and expensive. Finally, WENS, through no fault of its own, has time after time lost valuable network shows to out-of-town VHF stations viewed in Pittsburgh.

An interesting revelation of how much better VHF fares than UHF in the Pittsburgh market is shown by the financial improvement which WENS enjoyed during the period from March 13, 1955, to May 1, 1955. The WENS tower was completely destroyed by a windstorm on March 11, 1955. During the next 6 weeks WENS used on a temporary basis the facilities of the VHF (channel 13) educational station in Pittsburgh, WQED. Even though this station operates on very low power, spot surveys taken before and after the temporary switch to channel 13 revealed that ratings tripled on the surveyed shows. Further, national spot advertisers not heard from during the almost 2 years that WENS had been on the air began making inquiries. New orders were received, but only for the duration of the time that WENS was on channel 13. Other advertisers informed the station that they would be happy to enter into long-term contracts if WENS could stay on a VHF channel.

Pittsburgh is one of the largest markets in the Nation. Under the principles enunciated in the Commission's sixth report, the Pittsburgh metropolitan area, with a population of 2,213,236, should have at least 4 commercial television stations, each of which will be able to compete with the others without facing unnatural handicaps. As things stand, when stations get on the air on channels 4 and 11, there will be three operating VHF stations in the Pittsburgh area. Faced with this competition, WENS could not hope to survive as a UHF station.

If it should cease to operate, the Nation's eighth market would be limited to three television stations, each carrying principally network programs. If, however, WENS were permitted to operate on a VHF channel, it is prepared, if necessary, to operate as an independent. While a network affiliation is preferable, WENS does not believe that a network affiliation will be an indispensable requisite to successful operation on VHF.

WENS believes that the principal corrective measure which must be taken is the deintermixture of UHF and VHF channels throughout the country to the greatest extent possible without disrupting existing television operations. This view has been urged in many of the comments and reply comments which have been filed in the Commission's general rulemaking proceeding. Most of the major organizations in the industry have endorsed deintermixture of one sort or another, including the American Broadcasting Co., National Broadcasting Co., Radio Corporation of America, Columbia Broadcasting System, General Electric Co., Storer Broadcasting Co., Westinghouse, and General Teleradio.

The problems confronting UHF broadcasters are so well known that discussion would serve no useful purpose. In short, intermixture has not worked. It has not, as predicted in the sixth report, resulted in the development of a fully competitive nationwide television service. For example, there are no UHF stations on the air in the top five markets. Only 4 UHF's operate in the first 13 markets, and each of these has disclosed to the Commission or to the Potter committee that it is in financial distress.

Since all the very large markets have VHF stations in operation and relatively low UHF receiver circulation, or none at all, the only way to accomplish deintermixture in these markets without imposing substantial hardships on existing stations and the public is to allocate additional VHF channels where four or more VHF's are not already assigned for commercial use.

On December 5, 1955, WENS filed comments in an FCC rulemaking proceeding (docket No. 11514) showing how Pittsburgh could receive an additional VHF channel allocation without deleting a VHF allocation for another locality. This could be accomplished by placing height and power limitations on the use of certain channels in Pittsburgh and in Weston, W. Va., and by the installation of directional antennas to protect existing cochannel stations. WENS appended to its comments an engineering affidavit showing that its proposals are feasible from a technical standpoint. WENS believes that by similar techniques additional VHF channels can also be allocated to other principal markets which do not now have four or more commercial VHF assignments. In this way all major markets can have sufficient competitive television channels—all VHF or all UHF—to meet at least their minimum requirements.

[Inserted on May 15, 1956]

Statement of Charles W. Lamar, Jr., Permittee of UHF Television Station WPFA-TV, Pensacola, Fla., and of KTAG Associates, Permittee of UHF Television Station KTAG-TV, Lake Charles, La.

WPFA-TV, a UHF television station in Pensacola, Fla., went on the air on October 16, 1953, and signed off the air because of continuing financial losses on December 19, 1955. KTAG-TV, a UHF station in Lake Charles, La., has been on the air continuously since November 2, 1953.

On October 18, 1955, WPFA-TV and KTAG-TV filed with the Federal Communications Commission a petition for rulemaking to accomplish deintermixture in several markets along the gulf coast by (1) deleting from Beaumont-Port Arthur, Tex., and New Orleans, La., VHF channels which are in hearing status; (2) adding second commercial VHF channels to Pensacola, Fla., and Lake Charles, La.; and (3) substituting one VHF channel for another VHF channel which is in hearing status for Biloxi, Miss.

On November 10, 1955, the Commission dismissed some 35 deintermixture petitions without prejudice to their subsequent reconsideration on the merits in a general rulemaking proceeding ordered that same day. The WPFA-TV and KTAG-TV petition was not considered on its overall merits. The Commission, as Chairman McConnaughey told you on February 20, 1956, has not yet rejected deintermixture. WPFA-TV and KTAG-TV filed comments in the Commission's general rulemaking proceeding on December 15, 1955, and reply comments on February 8, 1956.

Deintermixture of VHF and UHF channels to the greatest extent possible without disrupting existing television operations has been urged in very many of the comments and reply comments which have been filed in the Commission's general rulemaking proceeding. Most of the major organizations in the industry have endorsed deintermixture of one sort or another, including the American Broadcasting Co., National Broadcasting Co., Radio Corporation of America, Columbia Broadcasting System, General Electric Co., Stoner Broadcasting Co., Westinghouse, and General Teleradio.

The problems confronting UHF broadcasters are so well known to this committee that discussion would serve no useful purpose. In short, intermixture has not worked. It has not resulted in the development of a fully competitive nationwide television service. By way of example, WPFA-TV and KTAG-TV refer you to the gulf coast area with which they are familiar.

At the present time, the Beaumont-Port Arthur, Tex., area is allocated channels 4, 6, and 31 for commercial use and channel 34 for noncommercial educational use. Channel 6 is assigned for use by KFDM-TV, which began operation on April 24, 1955. Channel 31 is assigned for use by KBMT-TV which began operation on May 9, 1954, approximately 1 year before KFDM-TV. The remaining commercial assignment, channel 4, is the subject of a comparative proceeding. The hearing on the merits in this case was delayed pending the outcome of preliminary Commission proceedings to determine whether a third application should be dismissed. The educational reservation has never been applied for.

New Orleans, La., is allocated channels 4, 6, 20, 26, 32, and 61 for commercial use and channel 8 for noncommercial educational use. Channel 6 is assigned to WDSU-TV which began operating on December 18, 1948. The other VHF channel is the subject of a comparative hearing. The initial decision of July 7, 1955, granted the application of Times-Picayune Publishing Co. and denied the competing applications of Loyola University and James A. Noe & Co.; exceptions have been filed with the Commission. At one time grants were outstanding for all four commercial UHF channels. Subsequently, construction permits for channels 20 and 32 were surrendered. The permit for channel 26 has been outstanding for approximately 2½ years. The only UHF station in New Orleans which has been built and which now is in operation is WJMR-TV. This station commenced operations on October 15, 1953, on channel 61, but following the surrender of the permit for channel 20, it applied for that channel and is presently operating on it. No application has been filed for channel 8, the educational reservation. Thus, New Orleans television service at the present time consists only of WDSU-TV on channel 6 and WJMR-TV on channel 20. The nearest outside service is from Baton Rouge, La., approximately 75 miles away.

Lake Charles, La., is assigned channels 7, 25, and 60 for commercial use and channel 19 for noncommercial educational use. The only channels presently in use are 7 and 25. KPLC-TV has been operating on channel 7 since September 29, 1954. KTAG-TV, Inc., is assigned channel 25 and has been operating station KTAG-TV on that channel since November 15, 1953. No applications have been filed for the remaining commercial assignment, channel 60, or for the educational reservation, channel 19.

Pensacola, Fla., is allocated channels 3, 15, and 46 for commercial use and channel 21 for noncommercial educational use. Channel 3 is assigned for use by WEAR-TV which began operating on January 13, 1954. Channel 15 was used by station WPFA-TV from October 16, 1953, to December 19, 1955. No applications have been filed for either channel 46, the other commercial assignment, or channel 21, the educational reservation.

Lake Charles, La., and Pensacola, Fla., are independent markets approximately 285 miles apart. However, to a large extent the same considerations apply to both. Each is well below the top 100 markets in the Nation—Pensacola being ranked as 183 and Lake Charles as 206 (J. Walter Thompson Co.). In Pensacola UHF station WPFA-TV has been required to compete with VHF station WEAR-TV, while in Lake Charles UHF station KTAG-TV has had to compete with VHF station KPLC-TV. Experience has demonstrated that in these 2 markets UHF cannot compete successfully with VHF, even though only 1 VHF station provides competition to the UHF operation. As smaller markets, Pensacola and Lake Charles have not been in great demand by national advertisers (either on a network or spot basis) and when coverage has been sought the VHF channel has been preferred. WPFA-TV has already had to suspend operations. If the present television assignments in these two cities are continued, KTAG-TV will also inevitably be forced to abandon its UHF operation, resulting in television service to this community from only the remaining VHF station. The public interest could not be served by such a result, and, unfortunately, if existing allocations are continued, VHF monopolies in each of these cities are virtually certain. For protection of the public interest a way must be found to permit the operation of more than one station in both Pensacola and Lake Charles. This would be possible if stations could compete on an equal basis—all UHF or all VHF. Making the markets all UHF would entail lengthy and time-consuming proceedings involving the modification of the permits of WEAR–TV, Pensacola, and KPLC–TV, Lake Charles, and expense to these stations if they were ultimately required to move to UHF frequencies. The practical and realistic solution is the addition of a second VHF channel to Pensacola and Lake Charles.

WPFA–TV (channel 15) was the first station on the air in Pensacola, Fla., starting operations on October 16, 1953. WEAR–TV (channel 3) began operations approximately 3 months later. WEAR–TV has been affiliated with ABC, Du Mont, and CBS. WPFA–TV has been unable to secure a network affiliation. Notwithstanding WPFA–TV's diligent advertising campaign to promote UHF, UHF receiver conversion in Pensacola fell far short of expectations. Indicative of the inferior competitive position which WPFA–TV occupied was its top hourly rate of $120 as compared with $225 for WEAR–TV. The Pensacola market, ranked 183 in the Nation, has a population of 112,706 persons and 1948 retail sales totaled $75,872,000 (J. Walter Thompson). This area can support more than one television station, provided each starts from an equal competitive position. The nearest community in which other television stations are operating is Mobile, Ala., ranked as the 83d market in the Nation, approximately 55 miles away. There, WALA–TV, affiliated with ABC, CBS, and NBC, has been operating on channel 10 since January 14, 1953. WKRG–TV, a CBS affiliate, began operations on channel 5 on September 4, 1955.

KTAG–TV (channel 25) went on the air in Lake Charles on November 15, 1953, and was followed by KPLC–TV (channel 7) approximately 1 year later. KTAG–TV has made assiduous efforts to obtain a high degree of UHF conversion, but there too the results have been disappointing. KTAG–TV has had the benefit of affiliation with CBS, but its location in the 206th market in the Nation has meant a reluctance on the part of network advertisers to buy it. Because of the minor standing of the market and because of the mere fact that KTAG–TV is a UHF station, there also has been little incentive on the part of national advertisers to place spot business on it. The VHF station in Lake Charles, KPLC–TV, is affiliated with NBC and ABC. Indicative of the competitive inequality between KTAG–TV and KPLC–TV is the top hourly rate of $180 for the former and $262.50 for the latter. The population of the Lake Charles market is 89,635 and 1948 retail sales totaled $71,104,000. While experience has demonstrated that a UHF station in this market cannot compete successfully against the existing VHF station, the market is capable of supporting two VHF's. The nearest community in which television stations are operating is Beaumont-Port Arthur, Tex., ranked as the 94th market in the Nation, approximately 55 miles away. As noted above, one VHF station and one UHF station are operating in that market, with a second VHF channel the subject of a comparative proceeding.

KTAG-TV's and WPFA-TV's experience in Lake Charles and Pensacola is similar to that of other UHF stations in medium and small markets faced with the competition of a single VHF station. For example, WKAB–TV, in Mobile, Ala. (population 129,009), commenced operation December 29, 1952, but was forced to quit the air August 1, 1954, although its only competitor was VHF station WALA-TV. Similarly, KFAZ, Monroe. La. (city population 38,572; county population 74,713), commenced operation August 11, 1953. A VHF competitor, KNOE-TV, took the air September 26, 1953, and KFAZ was forced to cease operation May 1, 1954. (The Commission has since deintermixed Monroe by assigning an additional VHF channel there.) Other two-station, intermixed markets in which UHF stations have been unsuccessful are: Flint, Mich. (population 41,893); Tyler, Tex. (population 38,968); and Roanoke, Va. (population 91,921).

New Orleans, La., is ranked as the 22d market. Its population is 685,405 and its 1948 retail sales totaled $553,211,000. WDSU-TV, the VHF pioneer in that market, is affiliated with NBC; its top hourly rate is $800. WJMR-TV, the only UHF station which has been built in New Orleans, is affiliated with ABC and CBS; its top hourly rate is $330. Experience throughout the Nation has demonstrated that, once a second VHF channel enters this market (through a grant of channel 4), UHF will be doomed. However, limiting the number of VHF channels in New Orleans to one will enable the existing UHF stations to survive and in time achieve competition equality with the VHF, and will allow an increase in the number of television services in this community. As the 22d market in this country, New Orleans is a place where UHF can prosper and grow. Survival of UHF in this market will be a boon to the UHF television service as a whole and will aid it in eventually gaining acceptance and equal status with VHF. New Orleans contrasts sharply with Pensacola and Lake Charles, both of which are well below the first 100 markets. In neither of these two latter communities is there any reasonable chance of UHF survival or growth.

Beaumont-Port Arthur, Tex., presents similar considerations to New Orleans. It too is within the first 100 markets in the Nation, being ranked 94. It too can be used as a vehicle for preservation of UHF. The population of this market is 195,083 persons and its 1948 retail sales totaled $193,671,000. The UHF station presently operating in this market, KBMT (TV) (channel 31) could survive and prosper if it were not forced into competition with two VHF stations. It is affiliated with ABC and NBC, while KFDM-TV (channel 6) has ABC and CBS affiliations. KBMT presently occupies an inferior competitive position—a top hourly rate of $220 as compared with $360 for KFDM-TV. It seems certain of extinction if channel 4 is granted, but removal of that channel should keep KBMT alive and thus aid in the general preservation of UHF as a going television service.

Accordingly, the recommended solution for the cities discussed above is the removal of the ungranted VHF channels from New Orleans and Beaumont-Port Arthur (channel 4 in each instance), the substitution of channel 4 for ungranted channel 13 at Biloxi, Miss., and the addition of channel 13 to Pensacola and channel 4 to Lake Charles. These changes would comply with existing separations. An alternative solution would be the addition of VHF channels on a reduced mileage basis at Pensacola and Lake Charles.

STATEMENT OF CARMEN MACRI, PERMITTEE OF UHF TELEVISION STATION WQIK-TV, JACKSONVILLE, FLA.

On July 29, 1955, WQIK-TV (then WOBS-TV) filed with the Federal Communications Commission a petition for rulemaking to partially deintermix Jacksonville, Fla., to UHF predominant and to increase the number of commercial VHF channels allocated to Savannah, Ga., from 2 to 3. On August 30, 1955, WQIK-TV filed a supplement to its rulemaking petition, pointing out that, as a result of its deintermixture proposal, a VHF channel also be allocated to Brunswick, Ga., WQIK-TV's proposal dovetailed in with the deintermixture petition, filed April 14, 1955, of Storer Broadcasting Co. and Gerico Investment Co. for Miami-Fort Lauderdale, Orlando, and Tampa-St. Petersburg, Fla.

On November 10, 1955, the Commission dismissed some 35 deintermixture petitions without prejudice to their subsequent reconsideration on the merits in a general rulemaking proceeding ordered that same day. WQIK-TV's petition was not considered on its overall merits. The Commission, as Chairman McConnaughey told you on February 20, 1956, has not yet rejected deintermixture. WQIK-TV filed comments in the Commission's general rulemaking proceeding on December 15, 1955, and reply comments on February 8, 1956.

Deintermixture of VHF and UHF channels to the greatest extent possible without disrupting existing television operations has been urged in very many of the comments and reply comments which have been filed in the Commission's general rulemaking proceeding. Most of the major organizations in the industry have endorsed deintermixture of one sort or another, including the American Broadcasting Co., National Broadcasting Co., Radio Corporation of America, Columbia Broadcasting System, General Electric Co., Storer Broadcasting Co., Westinghouse, and RKO Teleradio.

The problems confronting UHF broadcasters are so well known to this committee that discussion would serve no useful purpose. In short, intermixture has not worked. It has not resulted in the development of a fully competitive nationwide television service. By way of example, WQIK-TV calls attention to the Jacksonville, Fla., and Savannah, Ga., areas with which it is very familiar.

At the present time, Jacksonville is allocated channels 4, 12, 30, and 36 for commercial use and channel 7 for noncommercial educational use. Channel 4 is assigned for use by station WMBR-TV, which began operation on October 16, 1949. Station WJHP-TV has operated on channel 36 since December 13, 1953. WQIK-TV holds a construction permit for channel 30. An application for a noncommercial educational television station on channel 7 was filed on November 18, 1953, but no final action has been taken on that application. Channel 12 is presently the subject of a comparative hearing in which an initial decision was released April 4, 1955.

Savannah, Ga., is allocated channels 3 and 11 for commercial use and channel 9 for noncommercial educational use. Channel 11 is assigned to station WTOC–TV, which began operation on February 2, 1954. On January 26, 1955, the Commission made a final grant after hearing to WSAV, Inc., for operation on channel 3, and operation thereon should commence in the near future. On May 25, 1953, the board of public education for the city of Savannah and the county of Chatham filed an application for a noncommercial educational station on channel 9, which application is still pending.

The city of Brunswick, Ga., has a population of 17,954 (1950 U. S. census). It is presently allocated UHF channels 28 and 34, but no applications have been filed for either of these channels. Brunswick and its environs is a VHF-only area. It receives VHF fringe service from stations WMBR–TV, Jacksonville, Fla. (channel 4), 57 miles away and from WTOC–TV, Savannah, Ga. (channel 11), 68 miles away. If the city of Brunswick is to have its own local television station at any time in the immediately foreseeable future, such station must be on a VHF channel.

During the past 2 years WQIK–TV has surveyed the Jacksonville market and studied the progress of UHF stations in other areas to determine whether it would be economically feasible to construct and operate its proposed UHF station in Jacksonville. It has reluctantly concluded that probably no UHF station and certainly no two UHF stations can hope to survive in a market which already has a prefreeze VHF station on the air, and which, after the conclusion of the channel 12 hearing, will have a second local VHF station. At the present state of television development, an affiliation with one or more strong national networks is of great importance to the economic survival of any television station and an absolute necessity to a UHF station in an intermixed market which must provide popular programs to develop and maintain UHF receiver circulation. In Jacksonville the prefreeze VHF station now carries the network programs of CBS and ABC. The existing UHF station carries NBC and occasional ABC programs. Judging from experience in other markets, the second VHF station will probably obtain a basic NBC affiliation shortly after it goes on the air. ABC, in order to remain competitive with the 2 dominant networks, will seek to place at least its better programs on 1 of the 2 VHF stations. The VHF stations will thus absorb the bulk of the better network programs, leaving only secondary affiliations and the less desirable programs for their UHF competitors, if in fact they still have any UHF competitors. The pattern already established over the country whereby CBS and NBC enjoy the lion's share of far-reaching VHF facilities will thus be extended to the very serious detriment of the third network and the general public.

In view of the overwhelming evidence that the advent of a second VHF station in a market, no matter how large (Jacksonville is the 60th in the Nation), is inevitably followed by the demise of the UHF stations in that area, WQIK–TV has been forced to the conclusion that construction and operation of a UHF station in Jacksonville, under the present television allocations for that city, would be most foolhardy. The station would be foredoomed to failure.

Jacksonville could be partially deintermixed by changing the educational reservation from channel 7 to channel 12 and the removal of channel 7. This would not produce complete deintermixture. There would still be the one prefreeze VHF station. Deintermixture, however, is not a goal in and of itself. The desired aim is to reduce VHF competition to a level which will permit the survival of UHF stations. It is believed that, in a market as large as Jacksonville, the removal of one commercial VHF channel from the market is adequate to insure the success of UHF service.

WQIK–TV fully appreciates the fact that the removal of a VHF channel from Jacksonville would not guarantee the financial success of UHF stations in that market. Nevertheless, WQIK–TV is confident that, through efficient operating procedures, including the joint use of AM–TV facilities and personnel, and without sacrificing program quality, multiple UHF stations in the Jacksonville market can achieve modest financial success. If Jacksonville is partially deintermixed, WQIK–TV will proceed expeditiously with the construction of its station, and will begin the operation of that station at the earliest practicable date.

Partial deintermixture of Jacksonville can be achieved quite simply and in full compliance with all the mileage separation and other requirements of the Commission's rules. The public would not be injured by such deintermixture.

The owner of each television receiver in the Jacksonville area would continue to receive as many signals as he now receives. The number of receivers in the Jacksonville metropolitan area (Duval County) capable of receiving UHF as well as VHF stations is now more than 60 percent of the total number of television homes in the area. Thus, as a result of the proposed change, a large majority of the set owners in the market would receive service from more stations than they can now hope to receive.

The removal of channel 7 from Jacksonville would permit its assignment to Savannah (which has no UHF channel and in any case could not support a UHF station), and would also permit the assignment of channel 8 to Brunswick. As shown above, Brunswick cannot have a local television station unless it gets a VHF channel.

The Jacksonville and Savannah markets are the 60th and 115th in the Nation, respectively. Each of these markets needs at least three fully competitive television stations so that residents of the respective service areas can have a choice of the national network offerings of all the networks. Similarly, Brunswick needs at least one local television outlet.

In addition to the above, partial deintermixture of Jacksonville when combined with deintermixture of the Miami-Fort Lauderdale area would permit the assignment of a third VHF channel to Orlando (channel 7) and Tampa-St. Petersburg (channel 10), both of which cities will otherwise be limited to 2 stations. Thus, deintermixture in Florida will substantially improve television allocations in six separate markets without dislocation of existing stations or hardship on the public. Clearly deintermixture is the recommended solution in this area.

UNITED STATES SENATE,
Washington, D. C., April 26, 1956.

Hon. WARREN G. MAGNUSON,
Chairman, Senate Interstate and Foreign Commerce Committee,
United States Senate, Washington, D. C.

DEAR SENATOR: I am enclosing copies of letters and telegrams I have received in regard to the television broadcasting study you are presently conducting.

I would appreciate very much your committee incorporating these letters into your study since they represent the thinking of constituents of my State.

Regards.

Sincerely,

HOMER E. CAPEHART.

HOOSIER STATE BANK OF HAMMOND,
Hammond, Ind., April 24, 1956.

Senator HOMER CAPEHART,
Washington, D. C.

DEAR MR. CAPEHART: I would like to express my support toward the bill now in Congress, which will permit the great expanse in the future of television and all-channel system comprising 12 VHF channels and 70 UHF channels.

Please register my support in favor of this bill.

Very truly yours,

JOHN F. WILHELM, *President.*

WAGNER & MALO,
Hammond, Ind., April 23, 1956.

Hon. HOMER CAPEHART,
United States Senate, Washington, D. C.

DEAR SENATOR CAPEHART: As a private citizen interested in the complete and democratic progress of the television industry, will you please use your influence with Senator Magnuson and his committee to recommend utilization of the UHF band or all channel system. I am reliably informed that if Lake County and other sections of our State are to ever have its own television system, the UHF band must be used.

Sincerely,

HAROLD C. WAGNER.

DELPHI HIGH SCHOOL,
Delphi, Ind., April 24, 1956.

Hon. HOMER E. CAPEHART,
The United States Senate, Washington, D. C.

DEAR SIR: I have recently read where the Federal Communications Commission has been refused additional high frequency channels now reserved for governmental use. Also that the Magnuson committee has had hearings on the UHF-VHF situation.

Due to the fact that the FCC is awaiting recommendations from the Magnuson committee before going ahead with a competitive television system for the United States, I strongly recommend that you use your powers to get the Magnuson committee to act on this all-important matter.

We need a competitive all-channel television system so that small towns such as ours will continue to operate a television station for their home audience.

Sincerely yours,

EDWARD J. CASASSA.

HOUSE OF REPRESENTATIVES,
STATE OF INDIANA,
Indianapolis, April 24, 1956.

Hon. HOMER E. CAPEHART,
Senate Office Building,
Washington, D. C.

DEAR HOMER: It appears that there is a matter before the Magnuson committee in which WFAM-TV is very much interested and I am told by them that a little insistence from the House and Senate to the Magnuson committee will bring about recommendations to the FCC for an all-channel competitive television system in America. Such action would, as I understand it, provide a fair and equitable climate for all operators including WFAM-TV. I know anything you can do to bring about such a recommendation would be very much appreciated by our local station.

Very sincerely yours,

C. G. BALL,
Joint Representative, Tippecanoe and Warren Counties.

COLUMBIAN PARK,
Lafayette, Ind., April 24, 1956.

Hon. HOMER E. CAPEHART,
United States Senate Building,
Washington, D. C.

DEAR MR. CAPEHART: From recent publicity we have noted that the Federal Communications Commission have been refused additional very high frequency channels now reserved for governmental use. We have also noted that the Magnuson committee have had extensive hearings on the UHF-VHF situation.

We also understand that the FCC is awaiting recommendations from the Magnuson committee before establishing a competitive television system for the United States.

We, therefore, strongly recommend that you use your influence to get the Magnuson committee to act rapidly on this all-important matter so that we will have in the very near future a competitive all-channel television system so that small towns such as ours will continue to operate a television station for their home audience.

MRS. ELIZABETH SHARPLESS.

JEFFERSON HIGH SCHOOL ATHLETIC DEPARTMENT,
Lafayette, Ind., April 24, 1956.

Senator HOMER CAPEHART,
Senate Office Building,
Washington, D. C.

DEAR MR. CAPEHART: I am of the understanding that the FCC is awaiting recommendations from the Magnuson committee before establishing a competitive television system for the United States.

Since I am a member of the athletic department of the local high school, I strongly recommend that you use your influence to get the Magnuson committee to act rapidly on this all-important matter so that we will have in the very near future a competitive all-channel television system so that small towns such as ours will continue to operate a television station for their home audience. I feel that the use of television for school sports activities is very important.

Sincerely,

J. C. LYBOULT, *Ticket Manager.*

LAFAYETTE NATIONAL BANK,
Lafayette, Ind., April 23, 1956.

Hon. HOMER E. CAPEHART,
Senate Office Building, Washington, D. C

DEAR SENATOR CAPEHART: According to recent publicity I have noticed that the Federal Communications Commission have been denied additional very high frequency channels now reserved for governmental use. I have noted also that the Magnuson committee have had extensive hearings on the UHF–VHF situation. It is my understanding that the FCC will have to wait recommendations from the Magnuson committee before establishing a competitive television system for the United States.

I would appreciate it very much if you would use your influence to urge the Magnuson committee to act rapidly on the all-important matter so that we will be able to have a competitive all-channel television system in the very near future so that small towns, such as ours, will continue to operate a television station for their home audince.

With kindest regards.

Sincerely yours,

BURR S. SWEZEY, Jr., *Vice President.*

[Telegram]

BLOOMINGTON, ILL.

Senator CAPEHART,
Senate Building, Washington, D. C.:

Will greatly appreciate any help you can give in getting the FCC to take some sort of action on the UHF situation by June 1.

Best regards.

WORTH S. ROUGH, *Manager, WBLN–TV.*

[Telegram]

MUNCIE, IND.

Senator HOMER CAPEHART,
United States Senate, Washington, D. C.:

Retel concerning our request that you contact members of FCC concerning action on allocations problem, we now also urgently request that you contact all members of Senate Interstate and Foreign Commerce Committee asking them also to write to the FCC Commissioners urging them to take some action on allocations problem.

DON BURTON,
BILL CRAIG,
Station WLBC–TV, Muncie, Ind.

TRI-CITY RADIO CORP.,
Muncie, Ind., April 13, 1956.

Senator HOMER E. CAPEHART,
Senate Office Building, Washington, D. C.

DEAR SENATOR CAPEHART: We are writing to you with respect to the hearings now being held before the Senate Committee on Interstate and Foreign Commerce in Washington, D. C., to determine the remedial action to be taken to provide a nationwide competitive television system.

At the present time there are now in operation 464 television stations in the United States. Of these 464 television stations, 365 are very high frequency (VHF) stations operating on channels 2 to 13 inclusive, and the remainder are ultrahigh frequency (UHF) stations operating on channels 14 to 82, inclusive.

All television stations which commenced operation prior to April 1952 are VHF stations (channels 2 to 13), and UHF television stations (channels 14 to 82) were authorized by the Federal Communications Commission's sixth report and order of April 11, 1952.

For a nationwide competitive television system UHF stations are necessary because there are 70 UHF channels and only 12 VHF channels. There are certain technical problems, however, facing UHF stations. In the first place, the great majority of receiving sets being built in the United States today are equipped to receive VHF stations only, and a relatively small percentage are equipped at the factory to receive UHF television stations. This is due in major part because of the fiercely competitive situation in the receiving set business, and the fact that it costs $15 to $35 more to construct a television set which will receive both the VHF and UHF stations. Also, in order to receive UHF stations, it is necessary for the receiving set owner to install a special UHF television receiving antenna which costs from $25 to $50, depending upon the distance from the operating UHF stations. For those television sets not constructed at the factory to receive UHF television stations there must be a set conversion in the field when desired by the set owner at a cost of from $20 to $50 in addition to the UHF antenna installation previously mentioned.

Furthermore, VHF stations are able to transmit the signals for a longer distance than UHF stations with a similar amount of power because of the fact that the higher frequencies for UHF television stations do not follow the curvature of the earth to the same extent as the VHF frequencies, but travel on a nearly straight line from the transmitting antenna. This means that a UHF station in order to have comparable coverage with a VHF station, if possible at all, must have a great deal more power which, of course, means a considerably more expensive installation. The situation is somewhat tantamount to two automobiles—one of which requires more gasoline (UHF) than the other (VHF) to travel the same distance.

UHF television stations were provided for in the Federal Communications Commission's sixth report and order in April 1952 because it was recognized that only 12 VHF channels with required minimum spacing of 170 miles utilizing the antenna heights and powers then contemplated could not possibly provide for enough television stations to have a truly nationwide competitive television system. This means that only 12 VHF channels do not permit many of the sizable communities of the United States to have their own television station for the presentation of entertainment, news, and local public expression, including a platform for the presentation of viewpoints of the legal representatives of our Nation to their constituents.

The plight of the UHF television stations has become increasingly more serious with the increase of power and antenna heights by VHF stations with the result that these VHF stations extend their signals more deeply into the towns and communities previously served by UHF-only stations. Moreover, as the FCC has authorized VHF stations to move their antenna sites away from the communities originally assigned so as to cover a variety of markets it has encroached upon the UHF television stations' service areas and ability to survive. This is known as market straddling and we can list two specific examples. UHF station KCEB in Tulsa, Okla., was forced off the air, and another UHF permittee never constructed the station as a result of VHF station KTVX, which was allocated to Muskogee rather than Tulsa, Okla., locating its antenna site 23 miles from Muskogee and actually closer to Tulsa than to Muskogee. UHF station KNUZ–TV, Houston, Tex., also was required to terminate operations chiefly because VHF station KGUL–TV (which had been assigned to Galveston) was permitted to locate its transmitter close enough to Houston to make it a Houston station for all practical purposes. This was further aggravated recently by the FCC authorizing a further transmitter move by this same Galveston station to a location even closer to Houston.

In all, the present problems for UHF stations arise from the following aspects:

(1) *The FCC's sixth report provided for both UHF and VHF stations in the same city and in areas within 60 miles from VHF stations.*—VHF stations with maximum power and antenna height put viewable signals in areas as far distant as 60 miles so that a viewer in many instances is content to limit himself to that signal rather than to spend the additional amount of money to convert his set or erect an antenna to receive the local UHF stations.

(2) *Networks have favored VHF stations rather than UHF stations as affiliates,* and have switched from a UHF to a VHF station when the latter came on the air after the former had been in operation for some time. Contracts with

UHF stations usually have a short cancellation clause, so that the UHF television station operates with the sword of Damocles dangling over its head. Network programs are the lifeblood for the successful operation of a television station and its very existence can be eliminated with the deprivation of network programs. By reason of the encroachment of the VHF stations' signals into UHF stations' service areas, some 58 UHF stations have been compelled to leave the air, and 109 UHF permits have been returned by the permitees. This, of course, has both direct and indirect adverse effects upon the remaining UHF television stations now in operation which presently number slightly less than 100.

(3) *The FCC has not taken any positive action for VHF–UHF deintermixture.*—During the hearings before the Potter subcommittee of the Senate Committee on Interstate and Foreign Commerce, in 1954, there were encouraging statements by the then Chairman of the Federal Communications Commission with respect to selective deintermixture for VHF and UHF stations. A number of applications were filed by various stations in then exclusive UHF markets (but where VHF allocations had been made and no VHF station was on the air) by reason of such encouragement of the possibility of selective deintermixture. This deintermixture for elimination of local VHF stations from UHF communities so that the latter stations could survive, however, has not materialized. In fact, the FCC has denied all petitions for deintermixture and granted VHF applications for certain of those areas in which only UHF stations had been in operation. While allegedly these petitions were denied without prejudice to the parties renewing their requests in a general television rulemaking proceeding now pending before the Commission, it is obvious that for all practical purposes, the "denial without prejudice" is one in name only.

Station WLBC–TV is one of the so-called successful television stations in operation in the United States at the present time. We have viewed with growing concern, however, the many UHF television stations which have been forced to suspend operation, and know of a number that "are hanging on by the skin of their teeth" awaiting some remedial action by either the FCC or the Congress.

From experience in operating a UHF television station for nearly 3 years as well as our active participation in the broadcast industry for more than 30 years, we feel that the following remedial steps should be taken:

(1) *Deintermixture.*—This would provide for a reallocation of channels so that only all VHF or all UHF stations would be grouped together in the same community or the same area.

(2) *Reduction of present VHF powers.*—This would reduce the coverage of present high-powered VHF stations, and enable UHF stations to compete more successfully.

(3) *Reduction of present VHF stations' tower heights.*—In those cases where it would not be practical to reduce the tower height itself, a corresponding reduction of power could be accomplished, thus further enabling the UHF stations to compete more effectively with VHF stations.

(4) *Reduction of presently prescribed minimum VHF mileage separations.*—With the reduction of such mileage separations, additional VHF stations could be granted to increase the number of television stations in the United States.

(5) *Limitation of television coverage areas to their own communities.*—With such a limitation television stations would compete against each other in the same community and would not encroach upon the service areas of stations in far distant communities.

(6) *Use of directional antenna systems for allocation purposes.*—With the use of directional antennas for allocation purposes many more VHF stations could be allocated at closer distances than now prescribed.

(7) *Elimination of the excise tax on all-channel receivers.*—With the elimination of the excise tax on all-channel receivers, the ultimate cost to the consumer for an all-channel set would be substantially the same as for a VHF-only set with the result that the distribution of all-channel sets which could receive both UHF and VHF stations would be encouraged.

(8) *Reduction of common-carrier cable and microwave-relay costs.*—A reduction of such costs would enable extension of network service to stations which cannot now afford such network programing because the market does not warrant the cost to the network of having that station as an interconnected affiliate.

Unquestionably, unless positive and early remedial action is taken, as many as 50 more UHF television stations will soon be required to suspend operations with the result that millions of dollars will have been wasted in television transmitting equipment and the cost to the public of converting receiving sets, thousands of persons employed by UHF stations are already and will be without jobs, and, most important of all, the communities concerned will be without those stations for local outlets over which civic and community leaders and their congressional representatives can discuss important local, national, and international subjects.

We feel that the Congress which supervises the actions of administrative agencies such as the Federal Communications Commission should take the necessary action to assure that there will be a truly nationwide competitive television system rather than a handful of powerful VHF television stations constituting a monopoly of the media of mass communication by television—unquestionably the most important communications media of our time. If we can supply any further information do not hesitate to let us know, and we will await hearing from you with respect to action taken from your end to remedy the present television situation in the interest both of your constituents and the country as a whole.

Sincerely,

DONALD A. BURTON,
President.
WILLIAM F. CRAIG,
Vice President.

CITY OF LAFAYETTE, IND.,
MAYOR'S OFFICE,
April 20, 1956.

Hon. HOMER E. CAPEHART,
Senate Building, Washington, D. C.

DEAR HOMER: I have been informed that the Federal Communications Commission has turned down application of any additional very high frequency stations.

It would therefore be necessary, in order to have cooperation in the United States, to utilize the ultra high frequency bands.

It seems that the Magnuson committee has voted to act favorably on an all-channel system.

I will most certainly appreciate your support in getting the Magnuson committee to act immediately.

Sincerely,

K. R. SNYDER, *Mayor.*

FIRST MERCHANTS NATIONAL BANK
& TRUST COMPANY OF LAFAYETTE, IND.,
April 20, 1956.

Hon. HOMER E. CAPEHART,
United States Senate, Washington, D. C.

MY DEAR SENATOR CAPEHART: It is my understanding that the Warren G. Magnuson committee has completed the investigation of VHF and UHF television.

I request that you urge the Magnuson committee to make recommendations for an all-channel competitive television system in this country.

This will enable cities like Lafayette to have a television station of their own.

Respectfully yours,

M. J. FERRITER, *Assistant Cashier.*

CHARLES L. SNYDER, INC.,
Lafayette, Ind., April 18, 1956.

Senator HOMER E. CAPEHART,
United States Senate, Washington, D. C.

DEAR SIR: We urge you to recommend positive and immediate action on the proposals set forth by the Committee for Competitive Television.

Thank you for your attention on this matter.

Sincerely,

C. L. SNYDER, *President.*

LAFAYETTE, IND., *April 20, 1956.*

Hon. HOMER E. CAPEHART,
Senate Office Building, Washington, D. C.

DEAR SENATOR: I understand now that the Federal Communications Commission has been refused and additional very high frequency television channels from the Government. This means that in order to have a competitive television system in America, FCC must utilize the ultra-high-frequency station band.

Therefore, we urgently request that you use your influence with the Magnuson committee for recommendation to the FCC for a competitive all-channel television system for America. This will enable many cities, such as our own, to have its own television station.

With kindest personal regards, I am,

Yours very truly,

GLENN C. NEIDIGH,
Chairman, Republican City Committee.

LAFAYETTE COOPERATIVE ELEVATOR CO.,
Lafayette, Ind., April 20, 1956.

Hon. HOMER E. CAPEHART,
Washington, D. C.

DEAR SIR: From recent publicity we have noted that the Federal Communications Commission have been refused additional very high frequency channels now reserved for governmental use. We have also noted that the Magnuson committee have had extensive hearings on the UHF-VHF situation.

We also understand that the FCC is awaiting recommendations from the Magnuson committee before establishing a competitive television system for the United States.

We, therefore, strongly recommend that you use your influence to get the Magnuson committee to act rapidly on this all-important matter so that we will have in the very near future a competitive all-channel television system, so that small towns such as ours will continue to operate a television station for their home audience.

Yours truly,

W. L. WOODFIELD, *Manager.*

WFAM-TV,
Lafayette, Ind., April 18, 1956.

Senator HOMER E. CAPEHART,
United States Senate,
Washington, D. C.

DEAR HOMER: I would appreciate it very much if you would request of each member of the Magnuson committee, who are investigating the UHF-VHF situation, to offer definite recommendations to the FCC within the next 10 days. We hope the Commission will make recommendations to the trade within the next month and a half. They have sat on their hands for more than 2 years, and many of the UHF's have fallen by the wayside, but we now believe we have a fighting group and at last, according to Chairman George McConnaughey's talk at the convention in Chicago, are causing the FCC to wake up and follow the line of procedure that we outlined to them.

We should also like for you to write the members of the FCC requesting that they come out with a recommendation for a competitive television system for the country now. This will save many UHF operators. It's the logical solution, and it's the FCC's duty to see that this is brought about.

Thanking you and kindest regards.

Your very truly,

O E. RICHARDSON, *President.*

TEMPLE ISRAEL,
Lafayette, Ind., April 25, 1956.

Hon. HOMER E. CAPEHART,
Senator from Indiana,
Washington, D. C.

DEAR SIR: From recent publicity it has been noted that the Federal Communications Commission has been refused additional very high frequency channels now reserved for governmental use. It has also been noted that the Magnuson committee has had extensive hearings on the UHF–VHF situation. We understand that the FCC is awaiting a recommendation from the Magnuson committee before establishing a competitive television system for the United States.

We, therefore, strongly recommend that you use your influence to get the Magnuson committee to act rapidly on this all-important matter so that we will have in the very near future a competitive all-channel television system so that small towns such as ours will continue to operate a television station for their hometown audience.

I have the honor to remain,

Very truly yours,

Rabbi N. WILLIAM SCHWARTZ.

[Telegram]

EVANSVILLE, IND., *April 26, 1956.*

Hon HOMER E. CAPEHART,
Senate Office Building,
Washington, D. C.:

Imperative that FCC be urged immediately by you and Senate Interstate Commerce Committee to take prompt action to resolve a definite policy with regard to future TV allocations system in this country. FCC has had over 2 years to study problem and has all necessary information and opinion to decide question. Nevertheless all pronouncements by FCC have indicated a policy of indecision and inaction. Failure of FCC to act endangers future development of TV in this country. Public and entire TV and electronics industry have great stake in future of TV and are entitled to know now which way we are headed in order to determine set buying and further expansion and improvement of a competitive TV system. We are not asking you to take a stand for or against us or anyone else. Only asking that you take a stand against FCC's indecision and inaction. Whole country and entire industry entitled to a verdict now before further delay causes irreparable harm. Respectfully request that you so communicate to the FCC and Senate Interstate Commerce Committee and advise us of results.

Kindest regards and best wishes.

JESSE D. FINE,
President, WFIE–TV.

[This letter and the one following were inserted on June 11, 1956]

COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE,
May 1, 1956

Hon. GEORGE C. MCCONNAUGHEY,
Chairman, Federal Communications Commission,
Washington, D. C.

DEAR MR. MCCONNAUGHEY: I have read with interest a copy of the speech which you delivered to the 34th annual convention of the National Radio & Television Broadcasters in Chicago on April 17.

I was particularly interested in your suggestion of a crash research development program on UHF. If this proposal is designed to stimulate a concentrated effort on the part of the industry to develop more efficient UHF transmitters and receivers to the end that UHF be made more nearly competitive with VHF, I would think that this was very constructive.

However, my attention has been drawn to one sentence in which you say—"Once this development program has been completed, the Commission and the industry will have a sound technical basis for making a long-term decision on the merits of UHF."

To the extent that this might be construed as indicating the Commission would postpone decisions on allocation changes designed to preserve UHF until such a program is completed, I would think that this would be unsound. The Commission has long since decided that UHF must play a vital part in a nationwide, competitive television system, and this is strongly reinforced by the action of the Office of Defense Mobilization in indicating that no additional VHF channels could be made available by the military.

It would seem to me that the Commission should go ahead with its consideration of changes in the allocations plan and I should hope that some kind of initial decision on this matter, laying down policies to be followed in preserving UHF, could be arrived at within a matter of a very few weeks. All the members of the committee have been receiving a tremendous volume of correspondence from not only UHF broadcasters but influential persons in communities now served by UHF, urging the committee to instruct the Commission to take some affirmative action not later than June 1, 1956. While it is quite clear that detailed changes in allocations cannot be made by that time, it would seem to me that the Commission could announce its preliminary conclusions before that date and then institute whatever proceedings may be necessary to implement these policies.

I would very greatly appreciate your comments on the proper interpretation to be placed on your remarks at Chicago as well as your best estimate as to the time when some action by the Commission on UHF can be expected.

Sincerely yours,

WARREN G. MAGNUSON, *Chairman.*

FEDERAL COMMUNICATIONS COMMISSION,
Washington, D. C., May 14, 1956.

Hon. WARREN G. MAGNUSON,
Chairman, Committee on Interstate and Foreign Commerce,
United States Senate, Washington, D. C.

DEAR SENATOR MAGNUSON: In my recent speech before the convention of the National Association of Radio & Television Broadcasters, I urged that a crash research development program on UHF be undertaken immediately. Once this development program has been completed, the Commission and the industry will have a sound technical basis for making a long-term decision on the merits of UHF.

In your letter of May 1, 1956, concerning my recent remarks, you state that if the crash research program is designed to stimulate a concentrated effort on the part of the industry to develop more efficient UHF transmitters and receivers, it is a constructive one. However, to the extent that such a program would postpone decisions on changes in TV allocations designed to preserve UHF until such a program is completed, you submit that it would be unsound. You urge that the Commission proceed with its consideration of allocation changes and that some kind of initial decision be reached in the next few weeks.

In urging a crash development program for UHF, I in no way intended that other possible actions be held in abeyance. On the contrary, I contemplated that as a necessary adjunct to the research program, the Commission would be doing everything possible to improve the immediate television situation and to assist UHF. I certainly agree with you that it would not be in the public interest to withhold action until the research program can be completed.

The Commission, as you know, is now actively considering the matter of television allocations and is devoting a great portion of its time to this complex problem. We are aware of the necessity of taking action at the earliest possible time and will do everything in our power to do so. However, we want to make sure that we afford careful and detailed consideration to all of the many proposals that have been urged upon us in order that we may determine which offer the most promise.

You suggest that while the Commission clearly cannot accomplish detailed allocation changes by June 1—the date by which a number of parties urge that action be taken—the Commission announce its preliminary conclusions before that date and then institute whatever proceedings may be necessary to implement them. While I cannot predict precisely when the Commission will take action, the highest order of priority is being given the subject, and I am confident that we will be able to take the next step in our proceeding within the next few weeks. As you point out, we will not be able to make final allocation changes at this stage in the proceeding, but we will be in a position to issue a proposal for specific allocation changes, as well as suggestions contemplating longer range solutions to the television problem.

Sincerely yours,

GEORGE C. McCONNAUGHEY, *Chairman.*

[Inserted on June 11, 1956]

JOINT COUNCIL ON EDUCATIONAL TELEVISION,
Washington, D. C., May 22, 1956.

Hon. WARREN G. MAGNUSON,
Chairman, Senate Interstate and Foreign Commerce Committee,
Senate Office Building, Washington, D. C.

DEAR MR. CHAIRMAN: Your committee has been studying current problems in the field of telecommunications, including the obstacles that are being encountered in utilization of the ultra-high frequency (UHF) channels allocated for television broadcasting. The Federal Communications Commission has likewise taken official cognizance of the UHF difficulties, and is presently engaged in a rulemaking proceeding to determine what action might be taken to improve the situation.

The Joint Council on Educational Television (JCET) is directly and deeply concerned with the UHF problem, and has participated both in the hearings conducted by your committee and in the proceedings before the Commission. Our most immediate interest, of course, lies in the channels that the Commission has reserved for noncommercial educational television, but we are fully aware that the future of educational television is dependent upon a sound allocations policy for the Nation as a whole.

Of the 258 channel assignments reserved for educational television, 86 are in the VHF and 172 are in the UHF range. There are 21 noncommercial educational television stations now in operation: 16 of these are VHF and only 5 are UHF. In addition to the five communities where educational UHF stations are already on the air, UHF channels have been reserved in New York, Los Angeles, Philadelphia, Baltimore, Washington, Cleveland, Buffalo, Atlanta, Kansas City, and many other communities in which large universities or other important educational institutions are located. It is apparent, therefore, that both the VHF and the UHF channels are of vital importance to educational television, and that its future development is seriously threatened by the adverse factors that have plagued and delayed the development of UHF television generally.

Accordingly, the JCET has followed with close attention the testimony before your committee and the comments that have been filed in the Commission's rulemaking proceeding. We believe that both inquiries are of great value, and in their light we have come to certain conclusions about the UHF problem, which are embodied in this letter.

Above all, we are convinced that the development of a satisfactory national television service, ample for the expanding and varied requirements of the American future, cannot possibly be achieved without vigorous and extensive exploitation of the UHF channels. Several proposals have been advanced which envisage the concentration of television broadcasting in the VHF channels, but these offer only a restricted and incomplete service wholly inadequate for our foreseeable needs.

The converse suggestion, that the VHF channels should be abandoned in favor of a purely UHF allocations system, is perhaps closer to the mark. Nevertheless, it does not appear feasible or desirable in the present state of the art. Certain technical problems in the UHF field, and the enormous investment by the public in VHF receivers and by broadcasters in VHF transmitters, alike dictate caution before so radical a shift is settled upon. If, in the course of scientific advance, a purely UHF service should emerge as the best solution, still there would necessarily be a considerable period of transition and conversion, to minimize capital sacrifices and avoid the loss of service to millions of viewers.

But whether the ultimate allocations basis of television broadcasting be purely UHF or both VHF and UHF, it is plain that the UHF channels must be a stable and vigorous if not the dominant component. "There is no known alternative," Dr. E. W. Engstrom of the Radio Corporation of America pointed out in the course of your hearings, "for we need the UHF channels in addition to the VHF channels for our still-growing black-and-white service and for the color service which is the newest of the mass communications media."

From the time of its inception as a broadcasting service in the Commission's 1952 television allocations plan, UHF television has confronted two primary obstacles: The existence of millions of receivers equipped only for VHF viewing, and slower technical development of UHF. These adverse factors have badly undermined UHF's ability to compete with VHF, and have tended to "snowball" so that UHF troubles are aggravated today far beyond what they were 2 years ago. The manufacture of all-channel receivers has declined, the viewing public has been slow to spend the money for conversion of VHF receivers to all-channel reception, networks have been reluctant to affiliate with UHF stations, and many UHF broadcasters have found it necessary to suspend operations.

If the present dangerous trend is to be checked, and UHF television put back on the road to health and growth, it appears to us that three basic steps must be taken:

(1) The manufacture of all-channel receivers must increase sharply, and substantially all receivers offered for purchase must be capable of all-channel reception;

(2) The competitive position of UHF must be bolstered by the creation and preservation of substantial geographical areas in which UHF is the sole or predominant television service; and

(3) The technical problems of UHF transmission and reception must be promptly and vigorously attacked, and the frontiers of the art pushed forward so that UHF will be as familiar as VHF to television engineers and servicemen.

It will be noted that the first of these measures is primarily the responsibility of the Congress, the second of the Commission, and the third of the telecommunications industry. In our opinion, each of the three is vital to the sound development of our national television system, and only by such a broad plan, and with the joint participation of Government and private industry, can a favorable resolution of this dangerous dilemma be achieved.

All-channel receivers.—At the inception of the UHF television service, it was hoped and widely expected that its growth would be sufficiently rapid so that the manufacturers of television receivers would, as a matter of enlightened self-interest, "push" the sales of all-channel receivers. For reasons which are common knowledge in the industry, these expectations have not been fulfilled. It is our understanding that fewer than 15 percent of the receivers currently being manufactured are equipped for all-channel reception, as compared with about 30 percent 3 years ago.

Of all the threats to the survival of UHF television, this is by far the most serious, for it is making a bad situation constantly worse. Nevertheless, in a highly competitive field such as the manufacture and sale of television receivers, it is unrealistic to expect that all-channel receivers will be produced in quantity under present circumstances. The only possible solution appears to be some governmental act that will make it economically advantageous for the manufacturers to abandon VHF-only models, and thus insure the distribution of all-channel receivers. We believe that this will require action by the Congress.

It has been proposed, for example, that the 10 percent Federal excise tax should be lifted from all-channel television receivers, and left applicable to VHF-only sets. Budgetary objections to this course of action may be insuperable, and suggest the alternative of raising the rate of tax on VHF-only sets, perhaps to 20 percent. Obviously, there are many possible variants of the basic proposition. One which might warrant consideration is reduction of the rate on all-channel receivers to 5 percent, the same as is applicable to most other comparable commodities.

Objection may be raised to such proposals on the ground that they would involve a tax discrimination against the inhabitants of areas served only by VHF stations. As we understand it, the purpose of the differential would be simply to insure that purchasers of new television receivers would obtain an instrument capable of receiving the UHF transmissions which, as a matter of national policy, will be a major component of television service throughout the Nation. However, the same objective might be accomplished without altering the tax situation, by an outright statutory prohibition—based upon the Federal Government's constitutional powers in such fields as interstate commerce and national defense—of the manufacture for public sale and distribution of television receivers not equipped for all-channel reception.

We have been reluctant to reach the conclusion that Federal legislation is called for. Whether by tax differential or penal provisions, the effect of the proposal will be to furnish an economic subsidy or statutory monopoly for all-channel television receivers. Fortunately, and unlike the subsidies that have been granted in certain other fields, it may be reasonably expected that the need of preferential legislation for UHF television receivers would endure for only a few years.

Deintermixture.—Under the Commission's 1952 allocation plan, the VHF and UHF channels are intermingled throughout the country, and both types are often assigned side by side within the same communities. From an engineering standpoint this is an efficient basis, for any zonal or regional limitations on the use of frequencies leads to waste through their nonuse in the areas from which they are excluded. From an economic standpoint, however, the intermingling of VHF and UHF has subjected UHF television everywhere to the direct competition of VHF stations, on terms extremely favorable to VHF, and customarily disadvantageous or even fatal to UHF.

We do not believe that it is necessary or would be desirable to tear up the present allocations scheme and substitute one based on complete geographical segregation of UHF and VHF stations. We do believe, however, that UHF must be given a certain amount of protection against the competitive incursions of VHF, in particular areas where VHF service can be dispensed with or limited in quantity, without detriment to the quality or variety of program service available to the public. Such protection can be given by an allocations policy commonly referred to as "selective deintermixture."

In communities where three or more VHF stations have already been established, there is little that can be done for the protection of competing UHF stations, and their main hope will lie in the distribution of all-channel receivers and technical progress in UHF transmission and reception. But where UHF stations have acquired a foothold and are either free from the competition of VHF or have a chance to survive the competition of 1 or even 2 existing VHF stations, surely their prospects should not now be darkened by the establishment of additional VHF stations. So, too, there may well be particular areas in which a single existing VHF station could be required to shift to a UHF channel without unreasonable hardship to the viewing public and with considerable benefit to UHF service as a whole.

The Federal Communications Commission, to which Congress has delegated the authority and responsibility for television allocations, now has this problem under consideration in its current rulemaking proceeding. We are aware that the Commission's task is a delicate and difficult one. But it seems to us that the facts and logic of the present situation, and the serious plight of the UHF stations that are now threatened with even more extensive competition from VHF rivals, must inevitably lead the Commission to adopt a limited policy of deintermixture. Such deintermixture, to be most effective, should provide adequate separation of UHF and VHF markets.

Technical research.—In his recent address at the annual convention of the National Association of Radio and Television Broadcasters, the Chairman of the Federal Communications Commission proposed an immediate "crash research development program on UHF" to the furtherance of which all sections of the telecommunications industry would contribute. Chairman McConnaughey proposed a "twofold approach * * * concentrating on both the UHF receiver and the UHF transmitter" and gave voice to the hope that better UHF receivers could be designated.

We believe that an intensive and broad-scale UHF research program is vital to both the rapid amelioration and the long-term solution of the UHF problem. Fortunately, there are encouraging signs that the telecommunications industry is aware of its responsibilities in their respect. For example, the Radio-Electronics-Television Manufacturers' Association has informed the Commission of their availability to "organize a program of study which * * * might encompass, for example (*a*) measurements to indicate the effective coverage of UHF broadcasting under various conditions of terrain and power; authoritative information of this kind has never been available; and (*b*) reliability and cost of receiving equipment in the UHF together with potentials for improvement."

Of course, such a research program, although the primary responsibility of the industry, should be undertaken in close consultation with the Commission and other interested Government agencies. Indeed, the entire UHF problem calls for cooperation between Congress, the executive branch, and the industry. To be sure, each of the three major steps that we have proposed is the primary concern of Congress, Commission, or the private companies, as the case may be.

Nevertheless, each of the three likewise requires mutual support from all sides if speedy and effective results are to be forthcoming.

We have mentioned, and wish to stress in conclusion, the need for prompt action. A critical situation has arisen, the resolution of which will inevitably be costly and, in some respects, painful. It would have been helpful if these or comparable steps had been taken earlier, but further delay will make the situation even more difficult.

A nation's capacity for growth and even for survival may be gaged by the vigor and resilience with which it treats its ailments and grasps its opportunities. How to achieve an ample and flexible system of television broadcasting is certainly not the smallest of the social challenges we face today. We strongly urge that your committee now take action on the basis of the useful inquiry that it is conducting, and we hope that our suggestions may be of assistance in the shaping of an effective program for the salvation and growth of UHF television.

On February 29, 1956, Ralph Steetle, executive director of the Joint Council on Educational Television, made an appearance before your committee in connection with the current proceedings relating to UHF. This statement is presented by the Joint Council on Educational Television as a supplement to the one presented by Mr. Steetle, and it is requested that it be incorporated as a part of the record of these proceedings.

Respectfully submitted.

ALBERT N. JORGENSEN, *Chairman.*

[Inserted on June 11, 1956 (with one enclosure]

O'NEILL BROADCASTING CO.,
TELEVISION STATION KJEO,
Fresno, Calif., June 1, 1956.

Mr. KENNETH A. COX,
Committee on Interstate and Foreign Commerce,
United States Senate, Washington, D. C.

DEAR KEN: I am sending you, under separate cover, a coverage map of many of California's television stations which reach the Central Valley. These are actual station coverage maps received from the stations indicated on the map.

I would appreciate it if you would enter this map as a part of the record should there be more discussion as to whether or not white areas will be served by channel 12 in Fresno.

Also, enlcosed is a copy of the 1956 ARB Metropolitan Area television coverage survey. I am sure the report for the city of Merced will stand to dispute the testimony given by Bill Lodge of the Columbia Broadcasting System as to the KJEO and UHF coverage in the city of Merced.

Please accept my thanks for the courtesies shown me on my trip to Washington, and I wish to commend you and your committee for the job you are doing for the salvation of UHF television.

Kindest regards.

Sincerely,

JOE DRILLING, *Vice President.*

1956 ARB METROPOLITAN AREA TELEVISION COVERAGE

TO OUR CLIENTS

The information contained in this report gives you a very material advantage over organizations to whom it is not available. If these firms obtain access to copies of the study, it not only represents a complete violation of ARB's regulations, but it greatly decreases your competitive superiority. Also, of course, any organization using this material without sharing the cost of obtaining it is unfairly creating higher costs for all subscribers.

In your own interest as well as ARB's, we, therefore, urgently request your cooperation in observing our regulations covering use of this report. These regulations are detailed on the introductory page.

Thank you very much.

AMERICAN RESEARCH BUREAU, INC.

Introduction

On the following pages are detailed results of studies conducted to determine television saturation, coverage, and viewing preference in 225 key markets (including 234 different cities) largely untouched in television audience research. The survey was conducted during the period January 10–February 5, 1956. Also appended are saturation data from the regular ARB metropolitan area reports in additional markets covered by these surveys.

The information was secured by calling approximately 500 families selected by random pattern from the appropriate telephone directories (including toll calls) in each city and asking the following questions:

1. Do you have a television set?

2. (*a*) Which TV channels can you receive on your set, and from which cities do they come?

(*b*) Are there any other channels you can get?

For each channel received, ask:

(*c*) About how often did your family turn on channel (give number) during the past 7 days—less than 3 times, or more than 3 times?

3. (*a*) Which channel is viewed the most in your home after 6 in the evening?

(*b*) Which the next most?

4. (*a*) Which channel is viewed the most in your home on weekdays before 6?

(*b*) Which the next most?

Interviewers were trained to probe sufficiently (especially on question 2), so that full information would be received. All markets were surveyed in exactly the same manner, and may be compared with each other. In some markets, where many different TV stations are available, interviewers had difficulty in obtaining responses to the "station viewed most and next most" questions, giving rise to high "no choice" figures. Whenever given, multiple answers were accepted with the results apportioned equally among the stations mentioned.

ARB has attempted to distribute the sample in each area within the standard metropolitan district, which in most cases is the home county. In some instances, for geographical reasons, this has not been feasible, and a modified area has been used. In stating the area covered if, in ARB's opinion, more than 80 percent of a county by population has been covered, the entire county is shown. In all other cases the area covered has been described as precisely as possible, omitting mention of any county which was covered by less than 10 percent of the sample. In cases where more than one city is contained in the local telephone directory, these other cities are listed and the aggregate population covered is estimated in the coverage statement.

All stations reported under "able to receive" by less than 20 percent of the television families in the area are not shown separately in this column or the "viewed more than 3 times" column. Only stations with more than 5 percent in any one of the "viewed most" or "next most" columns are shown in these categories. It is felt that this policy will lead to much more realistic coverage analysis.

All material in this report is based on directory sampling and is, of course, subject to sampling deviations and other factors beyond ARB's control. Every precaution has been taken to insure accuracy of the material. Beyond this, ARB can assume no further responsibility other than to correct errors, if any, as promptly as possible.

It is our belief that the results, although limited to telephone homes within the total directory zone, should be more than sufficient for practical business decisions.

Due to the fact that the following material is highly confidential and its possession by subscribers gives them a material advantage in the purchase and sale of television time, rather severe restrictions must be placed on the dissemination of the information contained in this report. All material is copyrighted and must be used only within the subscriber's own organization (including branch offices). No further copies may be made for outside distribution and, although personal presentations may be made using the report, no copies of the information may be left with outsiders. Any public issue of all or any part of this report to the press or any other outlet is strictly forbidden. Inasmuch as the subscribers to the report have carried the cost of the study, these restrictions must be applied out of fairness to them.

For further information about this or succeeding studies, please contact the nearest ARB office.

[Received after the conclusion of the hearings]

STATEMENT BY PHILIP MERRYMAN, PRESIDENT OF THE COMMITTEE FOR HOMETOWN TELEVISION, FILED WITH THE SENATE INTERSTATE AND FOREIGN COMMERCE COMMITTEE IN CONNECTION WITH THE COMMITTEE'S HEARINGS ON NATIONAL TELEVISION ALLOCATIONS

First, may I express the thanks of the Committee for Hometown Television for the opportunity to file this statement with your committee. Having presented the case for our committee at a previous hearing, my purpose now is to assess the recent testimony of the networks and the allocations proposals of the Federal Communications Commission as published June 25, 1956.

The FCC's recent hearings lasted 7 months. The real, rock-bottom net of these hearings—as shown in the FCC's June 25 proposals—is sad and simple: The FCC Commissioners have downgraded their original priority 2 in favor of achieving "* * * a nationwide, competitive television system," a goal which is not even mentioned in the Federal Communications Act, which speaks rather of a "fair, efficient, and equitable" distribution of facilities.

You will recall that the FCC translated its congressional mandate into a series of priorities. Priority 1 was to provide all areas with at least 1 service, now about 90 percent attained. Priority 2 was to provide the largest possible number of communities with at least 1 television station, a priority still about 90 percent short of attainment. Priority 3 was to provide as many communities as possible with multiple service. It is worth noting in passing that the FCC considered the priorities as just that—goals to be sought in a descending order of preference.

But in its June 25 proposals, the FCC orders a series of deintermixture hearings forthwith—and, after concurring that conversion to all-UHF is the only way to achieve priority 2 (hometown television), it relegates that whole matter to the status of a long-term "study." I submit that "study" is most often the polite synonym for "stall."

As for deintermixture as presently applied by the FCC, it has almost nothing to do with priority 2. I can count on the fingers of one hand the number of communities which will get their first television facility as the result of such deintermixture. On the contrary, what the FCC's deintermixture is obviously aimed at is to increase competition in those areas already supplied with television. While this is an objective with which I can take no exception, it has nothing to do with the Communications Act's demand for a "fair, efficient, and equitable" distribution of facilities, and in any case ranks well below the requirement to supply as many communities as possible with television facilities of their own.

I think there is now no significant disagreement with the thesis that the future of United States television must be based on an all-UHF system. Consequently, all actions taken by the FCC from this point on must be judged by this criterion: Do these actions have as their primary objective the advance of United States television toward an all-UHF system? At this juncture, any administrative action with a lesser goal is merely obstructive.

What happened? How could the FCC spend 8 months considering hundreds of written comments and listening to millions of words of testimony before this committee with the avowed objective of implementing priority 2, only to bypass it in favor of this contraband concept of "competitive" television?

The answer lies partly, I think, in those "millions of words" I just referred to, words spoken mostly by the representatives of networks. The network heads testified on the defensive, under attack for the practices of option time and "must buy" and monopoly. Pressed on the latter point—monopoly—Mr. Kintner for ABC and Mr. Sarnoff for NBC both took the position that there was nothing wrong with TV that more outlets wouldn't cure, a position with which the FCC also agrees publicly in its proposals of June 25. The trouble was, however, that these admissions were soon lost to view in the networks' vigorous campaign for what they called more competition, by which they meant more competition between networks, no matter with the price to be paid by the loss of local network facilities, the loss of what I might term "priority 2 stations."

Let me say parenthetically that the Committee for Hometown Television has never advocated the destruction of networks, nor Federal legislation controlling network operation. Nor have we advocated elimination or reduction of option time. We recognize that so long as networks are a primary necessity for the national distribution of programs, they must have adequate option time privileges. We do deny that networks are the only possible means of distribution; and we do maintain that they should not be artificially sustained by Government policy to the detriment of competing systems of program distribution. But it was not difficult to see that when the networks preached "competition" within this context, what they were in fact seeking would simply bypass priority 2 and the locally owned facility.

Unfortunately, in its search for a solution, the FCC appears to have lost its way. "A nationwide, competitive television system" has been substituted for the original "fair, efficient, and equitable" distribution of facilities as the primary goal. Deintermixture has received immediate action, while conversion to all-UHF has been slowed down to a study. In a pattern with which the FCC has already made us uncomfortably familiar, the words are for hometown television but the deeds are for the networks. However good its intentions may be, the effect of the FCC's latest proposals is to line it up once again on the side of the networks and monopoly.

In television allocations, the truest test of intentions today is to be found in the answer to the question: Will this action give another community is own elevision facility? When we put this test to the FCC's latest actions, the answer is "No."

I would not pretend that each witness before the FCC is not in some sense a special pleader, and if I make the impeachment to the networks, I must also accept it for the Committee for Hometown Television. Of course, one reason that we have fought for the implementation of priority 2 is that it will benefit the UHF operators and independent VHF operators whom we represent. But I must make a distinction between our special pleadings and those advanced by the networks. Our's correspond precisely with the public interest, with the burden of the Communications Act, with the FCC's own avowed policy for protecting the public interest. The pleadings of the networks, on the contrary, run counter to the public interest, reaching their nadir, I submit, in the submissions of CBS. Here we had Mr. Frank Stanton basing his case for the networks on repeated assertions that the public interest required adoption of his views and defense of his practices; yet Mr. Stanton is also the spokesman for the network which seriously advanced as its solution to the allocations problem the complete jettisoning of UHF in favor of its all-network, 100-market concept; and Mr. Stanton is also the gentleman who has recently been quoted in the press to the effect that he did not propose to leave the committee's hearings with less than he went in. I submit that in the special pleadings you gentlemen are bound to hear, it makes a vast difference whether a position corresponds to, or is inimical to, the public interest.

You may perhaps recall that when the Committee for Hometown Television first advocated wide-ranging deintermixture, we stood alone. Today, we are, of course, gratified to see that the FCC has adopted this much of our program. But if we favor deintermixture, and the FCC has given us deintermixture, you may wonder why we now seem to belabor the FCC. The reason is simple: we favor deintermixture as an interim, ameliorative measure, the first step on the road to conversion to UHF. Without the second and bigger step of conversion to UHF, deintermixture—while welcome—is not enough; it gets us only part way to priority 2, half way to hometown television.

But the FCC, in its June 25 proposal, treats deintermixture as an end in itself, as a step to insure that "* * * nationwide competitive system." In other words, the FCC looks on deintermixture as a means for satisfying the networks' spurious and self-serving cries for more duplicating outlets for the use of the networks. This kind of deintermixture corresponds much more closely to the demands of priority 3, than to those of priority 2.

The FCC's report, having dealt with deintermixture as a thing-in-itself, then changes the subject and proposes its study of UHF conversion in such language that it is clear that implementing action isn't even yet on its agenda.

What then does our committee propose as the correct course of action?

First, and above all, I might repeat what we said in our original comments before the FCC, filed last December 9: "Both the Congress and the FCC have agreed that it is categorical national policy to assure the future of hometown television, priority 2. To implement this policy, the Commission must restore its priority 2 as a current objective." Which is to say, deintermixture must be treated, judged and granted only as part of an overall plan to convert to UHF, and not as a sop to the aspirations of networking.

Second, since conversion to UHF now seems inextricably tied up with the hearings proposed by the FCC, let the FCC make haste. Speed is essential at this stage of the operation, essential to rescue the UHF stations still hanging on, essential to preserve the integrity of the plan from the attacks which the networks will continue to mount, essential because FCC Commissioners come and go, administrations come and go.

It seems to me that, in one way, American television has come a long way in the last 7 months. At least we have mined out one essential truth: The only way to achieve a real national television system is through the unrestricted use of UHF. Let us not fritter this discovery away, let us not allow it to be watered down, dissipated in a torrent of words, confused by specious counsel. Let's hang on to it, protect it, and so be able to use it.

To this end, I say that nothing will be as useful, indeed as essential, as simple administrative speed. If the FCC must hold its hearings, let it hold them now, and finish them soon, while the momentum built up by these hearings is still an effective force.

Opponents of priority 2 have already revealed at least one tactic they propose to use: Delay. If we should go all UHF, goes the new line, we must be careful not to rob the set-owning public. Agreed. Now let me quote you the words of Mr. Henry C. Bonfig, president of CBS—Columbia Broadcasting System—as reported in the Wall Street Journal of January 9, 1956. Says the Journal "Mr. Bonfig said during the last quarter of 1955 nearly 1 out of every 3 TV sets sold was a replacement."

Our third proposal is that the FCC proceed with UHF conversion on a case-by-case basis.

Ever since the FCC issued its sixth report and order, it has been evident that the Commissioners had committed themselves to an erroneous policy, and that policy has been under steady and mounting attack. Under these circumstances, the Commissioners have quite understandably come to rely more and more on their engineering standards, less and less on their policy in making decisions. Policy has been debatable; but engineering standards are immutable and can be cited without recourse.

The result is that today the Commission is using a set of standards wholly inapplicable to the facts, in lieu of policy. A case in point is the table of separations, which has been invoked time and again to deny applications, as though the table were a sacred truth. But it is now evident to everybody—including the FCC, which proposes to amend it—that this table is unrealistic.

To overcome this lag between fact and policy with the least possible dislocation, we recommend that the FCC approach each application on a case-by-case basis, that is, on its own merits. The intent here, of course, is that in all applications which could bring television to a new community, the FCC occupy itself as a matter of policy in searching for reasons or methods by which the licenses can be granted rather than in applying with an even, judicial hand some totally in applicable rule simply because the sixth report and order created it.

Finally, let me speak for the UHF stations still lost in a sea of V's. Today we are no better off than we were 7 months ago; in fact, about a dozen UHF operators have given up in that period. The FCC now holds out the prospects of all UHF conversion, but to us this may be useless boon. We will all be dead and gone unless the FCC acts soon.

It has been suggested in these hearings that the main reason UHF operators find themselves in trouble today is not because of the failure of FCC policy but because they are poor businessmen, inexperienced in the field of entertainment. The facts speak otherwise. For instance, the four stations which originated the Committee for Hometown Television all operate very successful radio stations, and have for long periods. For instance, my own station, 30 years old this year, is now enjoying the most prosperous year in its history, is also the current winner of the national DuPont Award for Public Service.

We find ourselves in the present dilemma largely because we relied on the FCC to implement the policy it established, specifically priority 2. We are the casualties of an administrative failure.

We agree that the public's investment in VHF sets must be protected. But by the same token, we feel that the UHF stations which the FCC led down the garden path also have their claim to administrative dispensation.

It is not enough, I submit, to say with the FCC that we should have all UHF and maybe some day we will. It seems to us that the 100 UHF stations now facing or through bankruptcy should not summarily be dismissed; within the bounds of the public interest, speed and ingenuity and good will should be enlisted in the effort to bring hometown television to our own communities.

By this we mean—

> If an existing UHF station is the only television facility in its community (and therefore a means of implementing priority 2) it should receive all the administrative help it needs to survive.
>
> If that administrative help must include a temporary VHF license, pending conversion to all-UHF, then the FCC should do its utmost to grant it.
>
> If granting a temporary VHF license would involve some viable and temporary modifications of the FCC's antiquated engineering standards, then the FCC should undertake them.

And by this we mean: The way to build the UHF system we want is to protect the UHF stations we've got.

[Received after the conclusion of the hearings]

FEDERAL COMMUNICATIONS COMMISSION,
Washington, D. C., July 24, 1956.

Mr. KENNETH COX,
Counsel, Senate Interstate and Foreign Commerce Committee,
Washington, D. C.

MY DEAR MR. COX: In keeping with informal conversation with our office, enclosed are three tables:

Fifteen communities in which UHF stations continued to operate after VHF went on the air.

Sixteen communities in which UHF stations suspended operation after VHF went on the air.

Number of postfreeze TV stations in operation, July 1952 through June 1956.

Very truly yours,

DEE W. PINCOCK, *Acting Secretary.*

[1] Station resumed operation on this date.

Number of postfreeze TV stations in operation, July 1952–June 1956

	Number of VHF stations			Number of UHF stations		
	Going on the air	Going off the air	Total on air end of period	Going on the air	Going off the air	Going on air end of period
July–December 1952	11	0	11	6	0	6
January–December 1953	110	1	120	117	2	121
January–December 1954	69	3	186	25	29	117
January–December 1955	49	0	235	9	27	99
January–June 1956	20	0	255	4	9	94
Total	259	4	255	[1] 153	[1] 59	94

[1] These totals refer to the number of different UHF stations which went on the air and off the air during the above period. The columns do not add to the totals shown since 8 UHF stations went on the air twice during this period; of these 8, 3 went off the air a second time while 5 were still on the air as of June 1956

[Received after the conclusion of the hearings]

UNITED STATES SENATE,
COMMITTEE ON FINANCE,
July 27, 1956.

Hon. WARREN G. MAGNUSON,
United States Senate, Washington, D. C.

DEAR SENATOR: Thank you very much for your letter of July 16, urging the elimination of the excise tax on all-channel color television sets

Let me assure you that I shall keep your interest in mind and in the event hearings are held on this subject next session, you will be notified and given an opportunity to personally present your views.

With kindest regards, I am,

Cordially yours,

HARRY F. BYRD,
Chairman.

[Received after the conclusion of the hearings]

FEDERAL COMMUNICATIONS COMMISSION,
Washington, D. C., August 6, 1956.

Hon. WARREN G. MAGNUSON,
Chairman, Committee on Interstate and Foreign Commerce,
United States Senate, Washington, D. C.

DEAR SENATOR MAGNUSON: This is in reply to your letter of July 16, 1956, which refers to my letter of June 6, 1956, to you, in which was enclosed an exchange of correspondence between Senator Bricker and myself together with a copy of certain financial data for 1955.

This same information was submitted to Congressman Celler on the same basis as that on which it was furnished to you, for his use in connection with hearings before the Antimonopoly Subcommittee of the House Judiciary Committee. You have been correctly informed that it has now been made a part of the record before that subcommittee.

Sincerely yours,

GEORGE C. MCCONNAUGHEY,
Chairman.

CONTENTS

APPENDIX

Hearings held in connection with this Television Inquiry are being printed in four volumes, as follows:

Part I. UHF-VHF Allocation Problem (testimony of Federal Communications Commission).
Part II. UHF-VHF Allocations Problem.
Part III. Subscription Television.
Part IV. Network Practices.

TELEVISION INQUIRY

(Subscription Television)

MONDAY, APRIL 23, 1956

UNITED STATES SENATE,
COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE,
Washington, D. C.

The committee met, pursuant to notice, at 10 a. m., in room G–16, the Capitol, the Honorable Senator Alan Bible presiding.

Present: Senators Bible, Potter, and Purtell.

Senator BIBLE. The committee will come to order.

The committee is now turning its attention to a somewhat different phase of its television inquiry, the question of subscription television. Before calling on our first witness, however, we have received a number of items which should be inserted in the record:

First, is the additional testimony of Norwood J. Patterson, the general manager of KSAN–TV, channel 32, San Francisco, Calif., who originally appeared before this committee on February 27, 1956. His additional statement relates to the economic consequences of deintermixture to operators of stations affected.

Second, is a letter, dated April 2, 1956, from Dr. E. W. Engstrom, senior executive vice president, Radio Corporation of America, who testified before this committee on March 15, 1956. This letter furnishes data requested by the committee as to the cost of increasing the effective radiated power of a UHF station from 250 kilowatts to a thousand kilowatts.

Third, is a statement of Louis Lubin, the chairman of the businessmen's council of Americans for Democratic Action, commenting on the insufficiency of competitive channels, on the resulting lack of advertising time for small-business men, on certain network practices, favoring deintermixture as an interim measure, suggesting that this committee's ad hoc committee of engineers should have been broadened to represent business, and so forth.

Fourth, is a statement of Dr. Edward Lambert, of the University of Missouri, which operates KOMU–TV, who outlines the station's locally originated programs and emphasizes the importance of wide-area coverage in relation to its operations, in reply to testimony of Mr. Harold Thomas and Mr. Philip Merryman on February 27 and 28, 1956. This statement will be inserted in the record and printed in conjunction with such earlier testimony.

NOTE.—Staff members assigned to this hearing: Kenneth A. Cox and Wayne T. Geissinger, special counsel; Nicholas Zapple, communications counsel.

Fifth, is a statement by Sidney W. Dean, Jr., of New York City, supporting subscription television and proposing to limit it to a class of stations especially licensed for that purpose.

(This material will be found as follows:

(Items 1, 2, and 4 are printed in the second volume on the UHF–VHF Allocation Problem at pp. 1009, 698, and 1010, respectively.

(Item 3, because it refers to both allocations and subscription television, is printed at p. 1009 in the second volume on the UHF–VHF Allocation Problem, and is also set forth below.

(Item 5 is set forth below.)

(In addition, a letter from the national legislative committee of the American Legion, forwarding a resolution of the national executive committee of the American Legion urging the continuation of free television broadcasts in the interests of hospitalized veterans, which was inserted into the record on March 14, 1956 (see p. 630 of second volume on the UHF–VHF Allocation Problem), is printed at this point at the request of said committee.)

STATEMENT OF LOUIS LUBIN, CHAIRMAN, BUSINESSMEN'S COUNCIL OF AMERICANS FOR DEMOCRATIC ACTION

I am Louis Lubin, chairman, Businessmen's Council of Americans for Democratic Action. I submit this statement on behalf of the council.

The Businessmen's Council of ADA is an organization of businessmen concerned with giving expression to the liberal point of view within the business community. We believe that there is a liberal view on the question of this Nation's television policy. The views set forth in this statement represent a cross section of the council's opinion and experience rather than the view of any individual member.

The present availability of usable television stations and networks is now wholly inadequate for free competition, and flexible use of this powerful advertising medium by smaller and medium size, as well as large, businesses. Advertisers must buy low-cost mass audiences in order for television advertising to be profitable. On this basis, the number of VHF stations with large audiences is so few that their time is largely sold out and their rates and terms are no longer determined by competition, which is essential to a self-regulating industry. There are only 12 markets in the United States with 4 or more stations, and only another 22 markets with 3 stations in the same VHF or UHF frequency band. Only 57 additional markets have a choice of 2 stations in the same frequency band.

This lack of usable stations has similarly limited advertisers' choice to only two live networks which can give reasonably adequate national coverage. These two networks are sold out of evening time. Like the stations, the networks have taken advantage of this shortage to inflate rates, take over control of programing by selling programs in forced combination with their time, improperly influence local affiliations, promote their film, talent, and station representative subsidiaries, etc.

These conditions have resulted in a very high concentration of television advertising usage by a relatively small number of very large businesses. These large advertisers are able to preempt preferred times, programs, and stations under highly favorable quantity discounts and terms of options and renewals with which smaller advertisers cannot compete. The net effect is that these few large television advertisers can buy advertising audiences in terms of cost per viewer per minute of commercial time that may be as little as one-tenth of the net circulation cost of smaller advertisers who can only secure small audience programs at high open rates.

We favor the restoration of free and open media competition as the only basic solution to this situation. In our opinion, there is need for at least 4 national live networks, supplemented by additional independent stations in the 125 largest markets.

We would first favor a high-level study by the Congress of the present and future needs of advertisers as well as all other groups in the population. We favor the development of other forms of economic support for broadcasting, such as pay television, provided they will be assigned additional, exclusively licensed channels so as not to displace or restrict the growth of free commercial television.

In our opinion, it will require at least as many as the 70 UHF channels to provide an adequate television communication system for the total needs of business as well as other services. The ultimate gradual transfer of all broadcasting to the UHF band should be considered. As an interim measure, only, we would favor deintermixture of the UHF and VHF markets, each on its own merits.

Finally, we deplore the fact that the Senate committee's "ad hoc" group of advisers does not include representatives of business, journalism, publishing, entertainment, education, social and political institutions, etc., who are actual or potential users of television, as opposed to its present makeup which is dominated by the representatives of the networks, and station owners who have large vested interests in maintaining the present scarcity of facilities.

We would appreciate it if this statement could be made a part of your committee's record in this matter.

APRIL 20, 1956.

From: Sidney W. Dean, Jr., 94 MacDougal Street, New York 12, N. Y.
To: The Interstate and Foreign Commerce Committee, United States Senate.
Subject: Testimony on subscription[1] television.

FOREWORD

I address these comments to the Commission entirely out of my interests and responsibilities as a private citizen. My qualifications include 20 years of business experience in communications and media planning, marketing management and consulting, and various positions in civic and educational organizations. I have no investments in broadcasting or related equipment firms; I have no business gain or private interests to express beyond my long and carefully considered conviction that a proper system of audience payment for broadcasting will serve an indispensable role in attaining a free and diversified way of life for our Nation.

A. SUMMARY OF TESTIMONY

1. Subscription television is entirely in the public interest. Without an optional, competitive system of audience payment, broadcasting can never be a truly free and diversified medium like print, and can never serve the variety and essentiality of needs of the public, the creative professions, and the legitimate enterpriser.

2. Subscription television should be immediately licensed for exclusive, full-time station usage. But it should not be licensed for mixture with commercial, noncoded, sponsored television, in order not to interfere with its useful growth or deprive the public of "free" advertiser-sponsored television.

3. The present usable TV spectrum is wholly inadequate for the potential of commercial television, let alone new subscription stations. The foreseeable future need is for not less than the 70 UHF channels. Only a radical remedy, like the gradual transfer of all TV to UHF, will solve the problem.

4. The Congress should immediately establish a select committee on the total problems and opportunities of both sponsor-paid and public-paid broadcasting. As a first step, it should appoint an advisory council of journalists, educators, entertainers, writers, artists, political and social scientists, publishers, motion picture producers, businessmen, and advertisers to define present and potential total needs and opportunities for broadcasting services by all types of economic support, both free sponsored, educational, and public service, and audience payment.

B. SUBSCRIPTION TELEVISION IS IN THE PUBLIC INTEREST

The very structure of a free society is formed by the nature and controls of the communications systems which give it self-expression and cohesion. Democracy, as a system of representative self-government, has been most successful, and defensively most secure from external and internal attack, where a high level of literacy through universal education combined with a comprehensive,

[1] Terminology: In conformity with the Commission's language, the phrase "subscription television" is employed by me as a generic term for any system which permits a voluntary payment by the public for selected individual programs whose length and program charge may be varied by the program's sponsor.

diversified system of communications has given "the consent of the governed" its most effective expression.

The goals of our American way of life also seek to assure that individual self-expression and self-realization, in their widest political, economic, and cultural meanings, have the fullest scope consistent with justice and national security.

To realize these objectives, our constitutional tradition requires that the press and media of communications be freed to the greatest possible extent of technical or regulatory restrictions which might impede the flow and competition of ideas and services or obstruct free personal and business enterprise in the profitable development of innovations and improved services.

Our printed press is remarkably free to new ideas and services, since creative writers and publishers have relatively unlimited access to paper, ink, presses, and many channels of distribution to the public. It is responsive to the wants of practically every segment of the public, since small editions or units of circulation can be profitably sold to the public as books, pamphlets, or magazines in a variety of formats and prices.

In the print media, also, there has been ample opportunity for free circulation of literature, even books and magazines, which could be profitably conducted by advertisers, educational and social organizations, religious institutions, and frankly avowed political groups and lobbies. This mixed system of print communications has been responsive to our incredibly diversified and expanding communications needs and a thoroughly healthy influence on our lives.

But this situation has not existed in broadcasting. Its inflexible economic structure led to the almost accidental development of advertising as its only source of income—contrary to the opinion of Secretary of Commerce Herbert Hoover in 1926, who predicted that it would be supported by public subscriptions. Without the benefit of foresight, the licensing of radio frequency channels expressly prohibited the coding of broadcasts which is necessary for public payment systems. In fact, most of the radio frequency spectrum is now licensed for coded signals which the public cannot utilize. It would do no damage to the principle of the best use of the air in the public interest to permit the use of an additional portion of the broadcast band to coded broadcasting for pay and private profit. The present "free" broadcasting channels, like all the rest of the spectrum used by private firms and individuals, is in fact, and properly, licensed for private profit.

May I respectfully submit that both the public and our governmental agencies need to reexamine the validity of the so-called freedom-of-the-air issue? To the extent to which freedom of the air is equated with the constitutional privileges of freedom of the press, there is no precedent for assuming that freedom of the air requires free circulation, or no payment by the recipient. By analogy, this would equate freedom of the press with a requirement for free public circulation of our newspapers and magazines, which have permits to use the public mails at a public financial loss.

I therefore submit that a system of subscription broadcasting regulated to insure free access and free competition is completely consistent with traditional American freedom of the press. As is the case in the press, exemplified by shopping newspapers and free-circulation business magazines, it is best assured by a mixed system in which the publisher, sponsor, or producer is free to charge or not to charge, and in which the channels of distribution, mail, express, stores, carriers, etc., are eqally accessible to all.

The objection that there are not sufficient broadcast channels in the radio frequency spectrum to permit free access to all would-be broadcasters is not a pertinent argument for restricting broadcasting to free circulation, any more than it is a valid reason for restricting broadcasting to paid circulation. It is an unfortunate technical limitation that makes it all the more important that our public broadcasting policy require that our systems—pay, free, and educational—be diversified and open to competition between systems, as well as within systems, for both public audiences and public revenue.

If necessary to satisfy a semantic or regulatory technicality, an adjacent portion of the broadcast band could be ruled a commercial band for the purpose of subscription broadcasting. In either case, the objective is to free public broadcasting for both free and paid circulation, as is print and every other medium of communication.

A broadcasting policy for the United States must also deal with the realities of power and control. A communications system which does not provide the maximum of free access to ideas and services based upon providing equal opportunties to people for self-expression, and capital for profit, invites undemocratic forms of distribution and control of power over our minds and institutions.

In the photographic exhibit entitled "The Family of Man," now being shown in museums, there is a graphic vista of rooftops with their forests of television antennae to lend meaning to the quotation of Thomas Jefferson displayed below: "I know of no safe repository for the ultimate powers of society but the people themselves."

A direct public payment for a product or service is a voluntary, selective ballot which not only measures the usefulness of that service but provides the economic incentive for invention, competition, and expansion. As in other fields, free competition between systems, as well as between individual products or services, provides yardsticks of value as well as stimulants and assurances of enterprise.

Free broadcasting, due to its inescapable economic limitations, has lacked these essential elements and benefits of competition; free broadcasting has lacked a practical economic mechanism for profitably serving the multitude of less-than-majority tastes and interest; free broadcasting has been a force for social, cultural, and political conformity rather than of diversity; free broadcasting has provided inadequate rewards for innovation and penalized risk-taking; free broadcasting has tended to reward the facilities operator rather than the risk-taking producer and creative writers and artists; free broadcasting is a static and conservative force rather than a stimulant to growth and progress.

No other system of private communications or institutions which serve these many purposes has developed without this essential element of direct public payment and responsiveness. Not even Government itself, when it established free public education, regulated against paid private systems of education.

Many of our wisest and most objective men in public life, including educators, social scientists, creative writers, and artists, now believe that the past 30 years of experience in radio, and a few years of television, have proved by demonstration that the present economic system of broadcasting cannot satisfy the great and expanding needs for information, education, cultural, and entertainment services which could be provided by a diversified broadcasting structure with a wider economic base and greater opportunities for new ideas, people, and capital.

For these and many other reasons, it is in the highest public interest to establish a system of broadcasting providing for public payment. This system should be added to, but not displace, the already established systems of free commercial and educational broadcasting.

The following sections of these comments are intended to demonstrate that a new additional system of subscription television is now practical, and suggest standards for such a system. The questions and issues asked by the Commission's notice are answered in context.

C. PRINCIPLES FOR ESTABLISHING SUBSCRIPTION TELEVISION WITHIN A MIXED SYSTEM OF COMMERCIAL-SUBSCRIPTION-EDUCATIONAL BROADCASTING

There are three requirements essential to the public interest for the accommodation of a system into the present structure of broadcasting. The basis of these three requirements will be expanded in later sections of these comments.

1. Three classes of licenses must be established to define and regulate the services of each of the three types of stations: Commercal, subscription, and educational.

2. There must be a greater number of stations available in every area of the country in order to give each of the three systems of broadcasting free scope for audience and revenue development and maintain competition between stations, networks, and services.

3. Each station, whether it is commercial, subscription, or educational, must have equal access to the public.

To comment upon these requirements more fully:

1. Three types of licenses should be established:

(*a*) Commercial stations will broadcast uncoded sponsored or sustaining programs, but may not employ coded or subscription television systems.

(*b*) Subscription stations will broadcast coded subscription (see "definition") programs, as well as uncoded sustaining programs, but may not broadcast uncoded, sponsored programs.

(*c*) Educational stations will broadcast uncoded programs but may not employ coded subscription systems nor accept payments from noneducational sponsors. They will retain their present right to solicit funds or sell teaching aids, etc., on a voluntary basis.

(Educational institutions or firms may sponsor coded subscription broadcasts on subscription stations.)

The purpose of this program is to maintain not less than the present amount and kind of free commercial broadcasting now available, and prevent, through unrestricted licensing, the possibility that subscription television might displace free television even in the popular listening hours. By the separate licensing system proposed, all advertising revenues will be reserved for a permanent system of free, uncoded, broadcasting adequate to support not less than the present number of commercial stations, and undoubtedly more.

2. The channel requirements of such a mixed system may vary from 6 or 8 up to 12 to 20 stations per area, depending upon the ability to pay and the advertising productivity of the areas served. Since this is principally a function of the population, this range will vary with the population of each area. The following table is purely for illustration:

	A large population area	A small population area
Commercial stations	7	4
Subscription stations	7	4
Educational stations	2	1
Total	16	9

I am informed by engineers that the UHF band will provide a minimum of service from ten or more station channels for each and every area in the United States. By some variance to favor the heavily populated areas which contain two-thirds of the United States population, this number might be increased up to 20 channels in these large areas.

3. All television stations must ultimately move to the UHF band to satisfy the requirements of equal access to the public for each and every station.

I am informed that the additional cost and problems to the public involved in all-band VHF-UHF reception are a serious, if not an insuperable, obstacle to giving each station in every area equal access to the public. The record of UHF stations seems to prove this.

Therefore, to meet the requirements for equal access and opportunity for 8 up to 20 stations in a given area, 1 band allocation seems essential, although advocated by me solely on the basis of the technical counsel I have received, rather than as a matter of principle.

4. The timetabling and regulation of eventual discontinuance of VHF and transfer to UHF must be fairly, carefully, and slowly carried out. Some of the principles of such a shift might be:

(*a*) The establishment of a cutoff date for VHF 3 to 5 years in the future.

(*b*) The immediate granting of UHF licenses to VHF stations, with incentives to construct UHF transmitters to provide dual VHF–UHF services, as dual AM-FM services are now provided.

(*c*) Accelerated technical and marketing research programs with Federal funds, to minimize both the public's and the broadcaster's costs and burdens of conversion.

5. Safeguards and incentives for the investors and operators of exclusive subscription television stations must also be fairly and carefully developed. Some of the principles might be:

(*a*) Trial licensing of subscription stations in only a few large markets.

(*b*) Permitting, for an interim period, acceptance of advertiser sponsored, uncoded programs in those areas served by fewer than four, for example, commercial stations.

6. Methods of safeguarding the investments of commercial stations must also be fairly and carefully developed. Such principles might include:

(*a*) The setting of a cutoff date before which a commercial station might freely convert to a subscription license.

(*b*) After that date, the establishment of criteria for permissive conversion from a commercial to a subscription license.

(*c*) Incentives, such as tax writeoffs, to VHF stations to finance the construction of UHF transmitters to provide dual service during the transitional period.

7. Methods of safeguarding and compensating the public who have VHF-only receivers must be fairly and carefully developed. Such methods might include:

(*a*) Federally aided technical and marketing research to assist in developing minimum cost UHF conversion.

(*b*) Waiver of excise taxes, etc., on UHF receivers and converters.

(*c*) Possible income tax writeoffs on an amortized basis for obsolescent VHF receivers.

D. THE PUBLIC NEEDS, AND WILL PROFITABLY SUPPORT, A NATIONAL SYSTEM OF SUBSCRIPTION TELEVISION

My analysis of United States Department of Commerce studies of consumer expenditures indicates that the public is now spending about $15 billion a year for recreation, private education, and other outlays which are roughly equivalent to the services that a developed, national system of subscription television might provide. Excluded from this are $8 billion expenditures for public education, $2 billion for private education, and such speculative but potentially large sources of new revenue as the employment of subscription television for fund-raising by philanthropic, religious, and political organizations.

I will not document the variety of programing that the unprecedented convenience of subscription television will tap nor quote from the public surveys that have been made of its popularity where tested. I believe that the program services of subscription television will be substantially noncompetitive in both types and variety with commercial television.

In my judgment, a national subscription television system can attain an annual rate of gross revenue of four to five billion dollars by the end of its second year. This is equivalent to about $100 per set per year, or $2 per set per week.

This compares with the present annual rate of television advertising expenditures for facilities and programs of $1 billion. In the foreseeable 5- to 10-year future, it is unlikely that the economics of advertising will give television an annual revenue in excess of $2 billion.

A potential of 4 to 5 billion dollars annual revenue provides adequate profit incentives for the capital investment to establish subscription television. The following comparison between the present financial structure of the telephone industry and that of a potential subscription television industry supplies some basis for confidence in the availability of capital.

	Present telephone system	Potential subscription television
Telephones and sets, total	53,000,000	
Residential	32,000,000	40,000,000.
Revenue, annual	$5.4 billion	$4 to $5 billion.
Revenue per phone or set	$100	$100.
Investments, total	$16.2 billion	$15 billion.[1]
Investment per phone or set	$300	

[1] Rough estimate of present gross public and industry investment, unadjusted for depreciation, replacement, obsolescence, price deflation, etc.

I conclude that there is every reason to believe that creative American capitalism can and will supply the dynamics and leadership for a new industry of this magnitude and profit opportunity.

E. THE TECHNICAL SOLUTIONS FOR SUBSCRIPTION TELEVISION ARE NOW AVAILABLE

I am not qualified to evaluate the merits of the various proprietary systems now offered. However, it seems to me that many of the essential technical elements for a uniform, low-cost, dependable system are either in the public domain or available for patent pooling. These elements would appear to consist of a decoder plus a recording device like the A. C. Nielsen Audimeter which registers upon a tape the channel, day, and time of use. These elements lend themselves to an integrated system of tape collection and low-cost electronic computing, accounting, and billing operations.

It must be a requirement of any licensed system that it be uniform nationally, with a minimum service and maintenance load. It should also be a requirement that the public could rent all equipment on a telephone-type service basis so that nothing would need to be bought, or obsolescence risked. With a revenue potential of $100 per home per year such a system is financially feasible.

F. THE OPPORTUNITY TO PRODUCE OF SPONSOR SUBSCRIPTION PROGRAMS MUST BE FREELY AND EQUALLY AVAILABLE TO ALL, AND BE SUBJECT TO FEDERAL REGULATION

The regulatory structure of a subscription television system should have as a goal free, competitive, and identical access to any and all types of producers or sponsors. Such producers might include present motion-picture and theatrical producers, broadcasting network organizations, talent organizations, package houses, sports organizations and promoters, educational institutions, charitable organizations, churches, political parties and civic organizations, United States and foreign governments and agencies, publishers of books and magazines, lecture, concert, and musical groups, recreational and hobby groups, museums and art organizations, news and editorial syndicates, film and recording organizations, private individuals and business firms, etc.

To assure free and equal opportunity of access to all prospective "producers" (sponsors, publishers, program promoters, etc.) the services of the stations, their interconnecting networks, and the public collection system should be available on a flat rental fee basis, with the same rate, terms, and services for all. No brokerage, bulk wholesaling, or preemption of facilities should be permitted by anyone, including the station or networks. The program unit should be held to a reasonable maximum length (perhaps 2 hours) and sold only on an individual program or weekly cycle basis. No stations, interconnecting networks, or public collection system can be permitted to preempt time, secure preferential rates or services, or enforce "package deals" requiring purchase of talent, services, etc. If these distributive services also decide to establish program-producing organizations, there must be no preferential or preemptive controls over time or facilities.

Equal opportunities to secure and pay for time must be available to political opponents and opposing sides of controversial issues.

It is an important feature of this proposal that the capital risk for each program be assumed by the producer or sponsor, rather than by the station, interconnecting network, or public collection system. These latter distributive and collection services would set a flat rental which would give them a fair rate of return governed by competition from other subscription stations and criteria established by complete disclosure of financial results. The major profit opportunities and risks would thus accrue to the program producer or sponsor, and his creative personnel—writers, directors, artists, teachers, etc. The producer's gross profit solutions would be a function of the anticipated audiences available at the variable choice of prices which he may set. For example, a selective interest program, like a lecture or chamber music concert, might be as profitable a venture with 2 percent share of audience at $1 as a popular sports event with 10 percent at 25 cents.

Such a system should multiply present levels of personnel as well as the business incomes of these creative arts. Our enterprise system will respond with the new talent, ideas, and services for richer, more stimulating, and rewarding communications in education, entertainment, information, throughout our daily lives.

THE AMERICAN LEGION,
NATIONAL LEGISLATIVE COMMISSION,
Washington, D. C., March 6, 1956.

Hon. WARREN G. MAGNUSON,
Chairman, Senate Interstate and Foreign Commerce Committee,
Washington, D. C.

DEAR SENATOR MAGNUSON: Referring to the hearings now being conducted by the Committee on Interstate and Foreign Commerce relative to TV network regulation and UHF problems, I understand that no particular bills are under consideration but that the attendant problems are being studied by the committee.

I am taking the liberty of enclosing copy of resolution No. 105 adopted at the May 4–6, 1955, meeting of the national executive committee of the American Legion, urging the continuation of free television broadcasts, especially in the interests of hospitalized veterans.

I would indeed appreciate it if you would be good enough to have the enclosed resolution given consideration by the members of your committee during their deliberations on this problem. If possible, I would also appreciate the resolution being incorporated in the record of the committee's hearings.

Thanking you for your cooperation and consideration, I am,

Sincerely yours,

MILES D. KENNEDY, *Director*.

NATIONAL EXECUTIVE COMMITTEE OF THE AMERICAN LEGION

Meeting held May 4–6, 1955

RESOLUTION NO. 105

Committee: Department of New York.
Subject: Continue free television broadcasts in interest of hospitalized veterans.

Whereas the Federal Communications Commission is considering applications by patent holders seeking approval of systems whereby hitherto free television broadcast channels would be diverted to programs requiring payment by owners of receiving sets for the privilege of watching said programs; and

Whereas approval of any system requiring payment by the viewer for TV programs constitutes a definite threat to free programs now enjoyed by thousands of veterans in Government and private hospitals in all parts of the country; and

Whereas in many instances where it was permitted, American Legion posts and units of the auxiliary donated radio and television sets for the use and enjoyment of hospitalized veterans as a contribution to the morale and recreational therapy of those veterans; and

Whereas the American Legion has the responsibility for maintenance and repair of these television sets which would include the responsibility of installing decoders, coin boxes, or other gadgets under the pay-to-see-TV system; and

Whereas petitioners for pay-to-see TV are making definite statements that popular sporting events such as championship boxing bouts, world series baseball games, college and professional football games, and other attractions will be among their programs; and

Whereas this particular type of entertainment is enjoyed perhaps more than any other by the hospitalized veterans; and

Whereas suggestions have been made that Federal legislation might be sought to gain approval of pay-to-see TV; and

Whereas the Federal Communications Commission has asked all interested parties to file written reports dealing with the legal, factual, and public-interest aspects of pay-to-see TV on or before May 9, 1955; and

Whereas the national rehabilitation commission of the American Legion has taken this matter under advisement: Now, therefore, be it

Resolved, That the national executive committee of the American Legion requests the Federal Communications Commission and the Congress to make no rulings, nor pass any legislation changing the fundamental system of broadcasting and telecasting in the United States, hitherto devoted to free entertainment, information, educational, and other programs, which bring unlimited hours of enjoyment to millions of Americans including the hospitalized veterans whose welfare has been and always will be the prime concern of the American Legion.

Senator BIBLE. Our first witness this morning will be Mr. James Landis, the counsel of the Skiatron Electronics & Television Corp., and these various letters and statements to which I have just referred can be inserted in the record.

Mr. Landis, we are very happy to have you with us.

STATEMENT OF JAMES M. LANDIS, SPECIAL COUNSEL, SKIATRON ELECTRONICS & TELEVISION CORP.

Mr. LANDIS. Thank you. May it please the committee, for some 5 years now I have acted as special counsel for Skiatron Electronics & Television Corp., a New York corporation engaged in research activities in the television field.

Skiatron is one of three American companies which have actively developed and promoted subscription television systems, sometimes called pay-as-you-see television. These three systems have a number of differences with regard to the mechanical details of their operation. All of them, however, are basically alike in that they code or scramble the television signal at the point where it is broadcast over the air. The viewer thus receives upon his set an image that is utterly scrambled and audio signals that are unintelligible. However, at his receiving set the viewer will have a device known as a decoder, which, given the right combination, can be set automatically or otherwise to decode the signal being transmitted.

It is proposed that a consideration be asked of the viewer for providing him, program by program or week by week, with the right combination. A prime difference between the three systems lies in the manner in which the decoding combination is provided the viewer. One would do it by a coin-slot machine, another originally by the use of the telephone and presently, as I understand it, by the transmission of a key number to which dials in the receiving apparatus would be set. Skiatron has developed a card system upon which an electronic code is imprinted which, when inserted into the decoder, will automatically clear the image.

Skiatron has spent a great deal of time, effort, and money in developing what it conceives to be a simple and flexible method for decoding scrambled television programs. In this connection it has worked actively with International Business Machines to produce a simple and cheaply electronically printed card, together with methods for distributing the card and methods for accurately and automatically billing customers on the basis of how many programs on the card the customer chooses to use. These develpoments are at the point where they are ready to be put into commercial use.

Mr. Cox. Do I understand, Mr. Landis, that the same electronically printed card can be used to receive more than one program, then?

Mr. LANDIS. Yes; the card will have a series of programs for 2 weeks or 3 weeks or a month, and then the viewer who wishes to see a particular program will punch that particular program and that will record the fact that he has seen that program.

Mr. Cox. And that requires, then, the return of the card so that your organization can check the number of items punched and determine the amount that should be billed?

Mr. LANDIS. That is right. That is the way in which we have worked it out with the IBM people. The mechanical methods for encoding and decoding programs, though mechanically complex, are essentially simple to the user. The encoding mechanism is portable. It can be carried in two large suitcases. It can be installed in an hour or so at any broadcasting station so as to enable that station to code any program it chooses to transmit.

Mr. Cox. Is it proposed to sell these to the broadcaster or to license them to him?

Mr. LANDIS. It is not proposed to sell the encoding mechanism. It is proposed to rent it or lease it to a telecasting station. It is proposed to sell the decoding apparatus.

Mr. Cox. Now the complete encoding operation, then, is carried on at the television licensee's headquarters—at his transmitter or at the studio?

Mr. LANDIS. At the transmitter is where it is carried on. The decoding apparatus in the home of the receiver is a small enclosed box which can be installed by any trained television mechanic in a half hour or so. It can be manufactured to include within the box a UHF converter so that the consumer, with the acquisition of the box, will have available in one instrument both a decoder and a UHF converter. On the basis of mass production these decoder-converters can be produced so as to retail in the neighborhood of $40.

Senator BIBLE. Who pays the $40—the man that has the TV set?

Mr. LANDIS. The man that has the TV set.

Senator BIBLE. Very well.

Mr. COX. Do you propose to manufacture them yourself or to license the manufacture by others?

Mr. LANDIS. License the manufacture by as many as we can possibly get.

Mr. COX. Do you have a commitment from manufacturers to support this ultimate cost of $40 that you mentioned?

Mr. LANDIS. Yes; this figure is based on estimates given to us by 5 manufacturers who have examined the entire decoding apparatus, and they have come up with figures that average, as I say, in the neighborhood of $40 based upon a hundred thousand decoders.

Mr. COX. I take it, though, that even though this decoding apparatus may include a UHF converter, it would still be necessary for a set owner to purchase a tuner which would permit him to tune UHF channels, assuming the set he has purchased presently is only capable of tuning channels 2 through 13?

Mr. LANDIS. Yes; I suppose it would. It is hoped, however, that with the adoption of the system new television sets will be manufactured with decoder-converters already built in to the receiver in the same manner that converters now are available at the time of the purchase of the set.

Mr. COX. Do you have any estimate, then, as to the total cost to a man owning a VHF-only set who might desire to purchase your decoder and be able to receive encoded signals from a UHF station—that is, in terms of the decoder, the new tuner, and the installation of the UHF antenna if he doesn't already have one?

Mr. LANDIS. I do not have in my figures an estimate as to the tuner. The decoder and converter would run $40. Is Mr. Shanahan, your engineer, in the audience? Would you have an estimate on the tuner?

Mr. SHANAHAN. I think you probably misunderstood the question there. The tuner is the UHF converter we were talking about. There is no additional tuner required.

Mr. COX. This is a tuner that appears on the front or some easily accessible part of the set?

Mr. SHANAHAN. All standard television sets already have a tuner, from 2 to 13. The UHF converter will bring the signal down to one of the unused VHF channels.

Mr. COX. Well, if I understand you then, Mr. Shanahan, the converter converts a received UHF channel to one of the VHF channels, so it is only necessary to use the VHF tuner that is already available on the set?

Mr. SHANAHAN. Yes.

Mr. Cox. However, it would be necessary to have a UHF antenna, I take it?

Mr. SHANAHAN. That is correct.

Mr. Cox. And those cost, for installation, in the neighborhood of what?

Mr. SHANAHAN. I would not care to commit myself on that right now.

Senator BIBLE. Could you supply it for the record? We are trying to find out how much does this additional mechanism cost the actual user. I think that is a rather important question. Could you supply it for the record?

Mr. SHANAHAN. Right now?

Mr. Cox. No, at a later date.

Mr. SHANAHAN. Yes; we will.

Mr. Cox. Does this $40 figure which you quote include installation, or is there going to be added an installation charge for actually installing this decoder-converter on the set?

Mr. LANDIS. The $40 figure does not include the installation. We figured that the installation cost may be around $5 or thereabouts. The installation process is very simple.

Mr. Cox. How long does it take to install it?

Mr. LANDIS. About a half hour.

Mr. SHANAHAN. That is reasonably conservative, a half hour. That includes taking the back of the set off, pulling off a couple of tubes, installing adapters between the tube sockets and the tubes themselves. There is no actual wiring involved.

Mr. Cox. How many connections to the set are required?

Mr. SHANAHAN. On the average set, four connections, and these are all available by unplugging tubes in the set, sticking an adapter between the tube socket and the tube itself, and replacing the back of the receiver.

Mr. Cox. Now does this require that the serviceman making installation check the decoder in operation?

Mr. SHANAHAN. Let's say if a scrambled test pattern is available on the air, he can check it. However, the installation is so simple that, in general, it is not necessary for him to do that.

Mr. Cox. You may go ahead.

Mr. LANDIS. One more word with regard to the mechanics of the operation. The mechanical feasibility of subscription television has been proved beyond any doubt. For years Skiatron and Zenith have been on the air on an experimental basis, coding programs generally transmitted over the air and decoding them effectively at various points within the area of reception by these stations. Furthermore, the coding and encoding is a secure process, secure in the sense that the codes cannot be broken by outsiders except at an enormous and unprofitable expense. Skiatron's code, for example, of which there are at least a half million variations available, is contained in its electronically printed card so that even discovery of what the code on a particular card may be would be useless without reprinting and distributing cards containing this code—a process as to which both know-how and appropriate machinery is in the possession of Skiatron.

Mr. Cox. Now do I understand that the same identical card would be issued to all subscribers for the programs of a given month?

Mr. LANDIS. That is right.

Mr. Cox. And the decoder installed on every set is the same?

Mr. Landis. Yes; when I said the same identical card, there are variations possible. You might want, for example, to send a card to a particular group of people, a particular professional group, but I do not think that varies the nature of the question you tendered me.

Mr. Cox. Then if someone were to be desirous of trying to pirate the program, it would be a simple matter to get the card for the current month, and he would then have in his possession at least the information which, if he can interpret it, would make it possible for him to substitute electronically the impulses which will be transmitted by the circuit?

Mr. Landis. It is theoretically possible, but then to sell and distribute them he would have to sell and distribute a card containing that particular code.

Mr. Cox. And you would rely basically on the honesty of the public, the reasonableness of your prices, and the possibility of restraining such activities as unfair competition—or how are you going to protect yourself against a man who sets himself up to sell these?

Mr. Landis. We have certain legal remedies that would be available under the circumstances, but I think that the practical remedy is that the difficulty—the problem of detection is enormously expensive. These cards, to get at the combination you really have to tear them to pieces and probably the way to get at the combination would be by some device of finding exactly what the code is and what the electronic responses are that would be necessary to do the decoding.

Now then to duplicate that, once you have got the formula, to duplicate that in the type of card that we would distribute seems to me—in the first place, it is a species of larceny, and for that to go on in a mass way seems to me impossible.

You see, if we had just a simple dial setting for every decoding, it would then be easy for somebody to simply print the number and everybody would set his dial to that number without any cost, but here you actually have to have the type of card inserted into the machine, and to be in possession of a card of that type and to duplicate that in any mass volume seems utterly uneconomic and unprofitable for whoever might engage in it.

Mr. Cox. So you would concede the possibility of the matter being deciphered, but you think as a practical matter it is a risk that your company is willing to accept?

Mr. Landis. Oh, yes. We have gone into that quite a bit. The purpose of presenting the situation of subscription television to this committee is, however, not to demonstrate the mechanical feasibility of any particular system.

This committee, as I understand it, is concerned with the general economic and social phases of the existing television industry, the dominance of the networks in that industry, the practices they have pursued and still pursue to retain and increase that dominant position, the consequences that ensue to independent and nonaffiliated television stations, particularly in the UHF area.

Subscription television has a place in this inquiry insofar as the opening of television to a system of this type may introduce new and effective competitive forces that may open television broadcasting to independent enterprise and independent entrepreneurs, who presently, as a result of the economic structure of the industry, are effectively excluded from participation.

One way to combat monopoly and monopolistic practices is to restrain them by the strict enforcement of our antitrust laws. A second way is to create an economic atmosphere that will allow the introduction of competitive forces that can effectively dissipate the control hitherto exercised by a highly concentrated industry. Indeed, a comparison might be made between our antitrust problem and the conservation of wild game and fowl. In the latter field we have rigorous laws limiting the time and manner of hunting. At the same time, however, we create game and bird sanctuaries where the breeding of new life and new flocks can go on unimpeded.

Mr. Cox. In connection with your concern for monopoly, I would like to ask whether or not it is Skiatron's position that the Federal Communications Commission should license all three of the proposed systems, and any others that might be developed, or whether it is suggested that the Commission should select the best available system and license that exclusively, or authorize that exclusively.

Mr. Landis. I speak of that later here, and I show that we do not desire any exclusivity in the matter at all.

Mr. Cox. Fine, I will wait until that point.

Mr. Landis. Subscription television's position before this committee is not to complain about practices presently pursued by the networks and seek their abolition. It is to impress upon this committee the need for aiding it to have a small place in the sun so that it will have a chance with its own money and its own ingenuity to compete with the operations presently concentrated in the hands of the networks. That it can probably do so in an effective manner is perhaps as eloquently evidenced by the concentrated opposition of the networks to the introduction of subscription television.

Before the FCC, before other governmental bodies, in the press and before the public, the networks have consistently and persistently opposed every plea by subscription television for an opportunity to be permitted to sell its system to the public. This unanimous, concentrated and bitter opposition would not have absorbed the time and energy of these networks, did they not believe that in subscription television there was a serious threat to the dominant and controlling position that the networks now occupy in the field of television.

I pass by at this time lightly the opposition of the motion picture exhibitors. Their opposition stems from a different source. They happen to be in the same camp as the networks but for utterly different reasons. Forced to accept the fact of television, they wish to limit its effectiveness, for their fundamental desire is to choke off any further competition for the amusement dollar. In the past decade they have experienced the impact of television upon movie attendance and any improvement in telecasting would obviously increase that impact to their economic detriment. Indeed, their opposition boils down to one simple fact, an opposition to the improvement of home entertainment so as to force people to seek their entertainment on a mass basis, preferably in their theaters.

Mr. Cox. You would agree, then, that the authorization of subscription television might substantially impair the revenues of theater operators?

Mr. LANDIS. It would cut in. It would be another competitive force cutting in on the amusement dollar—by that I mean the amount of money that people have available for entertainment. We would be competing with that, and its impact would be felt in every field where the amusement dollar is being spent, probably in the moving picture field, as well as elsewhere. Maybe more so there.

Mr. COX. Does Skiatron propose, as do some of the other proponents of subscription television, to purchase outright the moving pictures produced in Hollywood or elsewhere, or would it simply seek limited exhibition rights?

Mr. LANDIS. I do not think one can answer that question definitively at this stage. We are too far from the economics of operation to be capable of answering a thing of that nature. I think, though, that your beginnings of course would be in purchasing limited licensing rights. The extent to which you could get them for any particular picture would depend, of course, upon the size of your pocketbook and the ability of your system to return enough revenue to justify a price that might be paid.

Eventually you may get into the problem of production yourself but in my experience, and I have had considerable experience in the moving picture field, the combination of production with other factors is not a wise thing. Somebody usually suffers as a result of that.

Mr. COX. Don't you have, though, in this situation, in addition to the present competition between television service offering one kind of program, with some movie fare, and the moving picture theater, you have here a situation where, if you buy the motion picture outright, you have cut the theater owner off from a supply of a commodity in which he deals; and if you simply purchase limited rights of exhibition, as I understand it, it is intended to do this early in the game so that it is still attractive to the public, you then are competing with him with the very thing that he proposes to show in his theater.

Mr. LANDIS. Well, if you bought the motion picture outright you would be foolish not to preserve what we call the residual value in a motion picture. In other words, after exhibiting it on television, then you would try to sell it down the line in theaters so as to get those residual values out. If you licensed it for a particular exhibition, you might license it as a first run or as a neighborhood run or as a second neighborhood run, cost determining, because these runs have great differences in value.

Now, if you had it as a first neighborhood run, obviously it would still have had its Broadway or its downtown run before that time, and you might come in at that stage. Just where you would come in is a matter of economics which has to be judged when you really get into operation.

Mr. COX. But you feel that it would be economic to offer first-class film product at a much earlier time than it is now being offered by television?

Mr. LANDIS. I think so, because I think we can produce the revenue along that line which is incapable of being produced at the present time under the existing system.

Mr. COX. Isn't that fact basic to any system of subscription television, in the sense that feature films will be the one most reliable and most available source of entertainment?

Mr. LANDIS. Yes, it is always there. You can always put it on. You don't have to wait for a good day like an athletic event. You can always stage a movie in the way in which you want to. It is a stable source of entertainment today—even on television or anywhere else.

The basic challenge that subscription television offers is a challenge to the very foundations upon which the television industry today rests. So far as broadcasting goes, television broadcasting has only one source of revenue—the advertising dollar. Its entire base rests upon that portion of the advertising budgets, broadly speaking of manufacturers of products for mass consumption, that is devoted to television. Subscription television, like the theater and the movies, seeks to derive its sustaining revenue directly from the consumer, and thus depends upon its existence for its ability to furnish entertainment for which, because of its quality or its character, the consumer is willing to pay

It is not my function nor my purpose to criticize existing television programing. Indeed, I think the industry as a whole is to be congratulated on its achievements. With the mass markets that we in America possess, capable of sustaining vast and expensive advertising campaigns, the television industry has succeeded in capturing sufficient revenue to bring the American public a program fare of which the Nation can rightly be proud. Nor is it my function to criticize or comment upon the interspersing of telecasting with so-called commercials. This, after all, is a matter of taste and there are many people who read the advertisements of Life and Fortune with an avidity equal to that with which they read the text.

Mr. Cox. Is it your proposal that subscription television be free of commercials?

Mr. LANDIS. It is our proposal that subscription television should be free of commercials. We believe that it would be better, and in accord with our general concept of programing, to eliminate the commercial from the screen.

Mr. Cox. And you would propose that the FCC so provide by rule?

Mr. LANDIS. We would not object to that at all. Whether the FCC should take action of that nature and make that a requirement is up to them, of course, but we certainly would not object and we would urge it.

Good as our programing fare is, there are recognized gaps in telecasting. I shall discuss them in a few minutes and point out the ability of subscription television to fill these gaps.

Before doing so, however, I feel it is essential to dispel certain myths that have grown up about subscription television, or been inspired by those whose self-interest has led them to oppose it. The common objection voiced to subscription television, and I could almost guarantee that you will hear that objection voiced before the committee, is that subscription television will require people to pay for what they now receive free and without charge.

Nothing is further from the fact. The proposals of the proponents of subscription television do not seek to convert channels now being effectively utilized for so-called free telecasting to a pay-as-you-see basis. They seek instead to utilize channels and frequencies incapable of being effectively employed under our existing system, to offer the public a supplementary television service which the public may or may not choose to buy.

Substantially every community today possesses channels of this type. New York City, for example, has three frequencies still unutilized. Philadelphia has also three, and so on down the line. Indeed, less than one-third of the available frequencies, of which there are 1,875, are being utilized today. Worse than this, expert testimony by CBS, never yet disputed, states that the economics of our present television system will permit the economic use of only 588 out of these 1,875 available channels.

True, most of these unutilized channels are in the UHF band, although a considerable number are VHF frequencies. It is the UHF channels that Skiatron has requested permission to use and only such VHF stations that the Commission finds cannot continue to use the frequency assigned to them.

I need not, before this committee, detail the plight of the UHF stations. Their basic difficulty stems from the absence of any programing sufficient to induce an audience chiefly equipped with VHF receivers to spend the money necessary to add converters to their sets so that UHF telecasting is able to reach them. Substantially speaking they have succeeded only in communities where no television was theretofore available, so that the initial purchase of a receiving set by a consumer had to include the cost of conversion. True, the engineers have said that VHF broadcasting has advantages in coverage as against UHF broadcasting. The basic problem, however, is a matter of economics and not engineering. The few sops that have been thrown to UHF thus far have not even begun to effect a cure of the situation.

Subscription television, however, has much to offer in the UHF field and with that in mind Skiatron shaped its proposal to the Federal Communications Commission with the purpose of aiding the UHF situation in a significant way. But before I present just how such aid can be effective, let me indicate the prime areas in which subscription television would and could operate.

Programing by the existing advertiser sponsored stations is controlled by one outstanding economic principle, which is, that the cost of programing plus the cost of transmission must not exceed the value to the manufacturer of the advertising contained in or surrounding the program. Different manufacturers, because of the nature of their goods, will evaluate the cost differently. The average, however, is admittedly about seven-tenths of 1 cent per household reached by the program. This means that a program costing $50,000 must, as a matter of economics, draw a listening audience of over 7 million people, or one that costs $100,000 must draw about 15 million people. There have been programs broadcast which have, according to the rating services, attracted up to 25 million and 30 million listeners.

The figures that I have given are the figures for black and white transmission. The costs for color broadcasting are still in the realm of speculation, but it seems agreed they will be in the neighborhood of 1½ to 2 times as much.

Mr. Cox. That would apply only to the actual cost of transmission, not to the matter of programing?

Mr. LANDIS. No, I do not think so, because the nature of the sets, the cost of the sets, the requirements for color and what not——

Mr. Cox. Costumes?

Mr. LANDIS. Yes, it means you have to increase that cost too.

These figures alone determine the limitations of present television programing. It must as an economic matter have a broad mass appeal and reach for a common denominator which will appeal to audiences of millions of people. It should contain nothing that would offend against the sensibilities or prejudices of any substantial group of people. For example, a producer recently told me that his sponsor insisted that in a certain historical skit he was producing, the presentation of General Grant as an efficient and humane general should be subdued because too many people, particularly in the southern section of this country, still held a different picture of him.

Mr. Cox. Well, wouldn't you find that the producers of subscription programs would also seek the largest available mass audience in order to increase the revenues that they can obtain from this service and that, therefore, they will also seek to find entertainment attractions that will appeal to as many people as possible?

Mr. Landis. They will naturally have a series of programs which will be devoted to a mass appeal, but I think when you analyze the situation you can recognize that subscription television, to operate effectively, cannot rest alone upon that concept. It has to rest, and I think myself more largely, upon the concept of appealing to specialized audiences rather than to mass audiences. Not that it won't appeal to mass audiences. A thing like a prizefight obviously does, but there is a range of programing possibly with regard to specialized audiences that can be both profitable to subscription television and, I think, of tremendous public importance to the system as a whole.

Mr. Cox. That is based on the premise that when you reach a smaller audience you will charge a higher fee in order to produce the same revenue, if the costs are the same, or that programs for these specialized audiences may be less expensive so they can be provided at the same fee?

Mr. Landis. I think I answer that in these next few paragraphs if I may continue.

Mr. Cox. Fine.

Mr. Landis. This basic economic limitation on programing does two things. It places a top limit on the cost of programing, and it also requires that, given a cost from $30,000 to $50,000, the program must be of the type that has a mass appeal to millions of viewers. A third subsidiary effect of these economic requirements, effective particularly in fields where contemporaneous presentation of a scene is of vital importance, such as athletics where the uncertainty of the outcome is a primary factor in audience appeal, is the danger that the available box office to the producer will be radically reduced without any compensating advantage to him.

Subscription television rests upon a different set of economic requirements. If we assume that the cost to the viewer of a particular program is $1, 1 consumer under this type of programing is economically equivalent to 140 consumers under the existing advertiser-sponsored system. In other words, if an audience of 7 million people is required to support a particular program under the existing system, an audience of 50,000 would support the same program given subscription television.

Mr. Cox. That would be only, however, if you did not propose to take care of the operations of the subscription system. In other words, you are using here the costs of broadcasting an unscrambled picture for that comparison.

Mr. LANDIS. Yes; you may say I ought to add something between 10 and 15 percent to that for the administrative costs of operating the subscription television system.

Mr. COX. And there must, of course, be a profit, I assume, for the manufacture of the equipment, the local agency which is handling the administration of this matter, and for the programer as well.

Mr. LANDIS. Well, I think that is all present in the normal program anyway. There is an element of profit to the advertising agency, to the entertainers, all that is present in that estimate.

This is where the value of subscription television, in my opinion, lies. It permits a flexibility of approach simply impossible under the existing system. If more money is required for programing that has a mass appeal, more money for this purpose will be available. The first run of any outstanding feature motion picture on Broadway at one theater can easily gross a million dollars. Oklahoma, for example, has already topped a million dollars at its showing at the Rivoli Theater on Broadway, and is still going strong. No sponsor can afford a price of that type, and if a producer sells a picture for less than that price to television he cuts in directly not only on its Broadway but its neighborhood grosses. Outstanding prizefights and other athletic events suffer from the same consequences. The loss to the box office is not compensated for by the revenues derivable from television. This is the reason why these events are commonly blacked out in the area where they take place, such as prizefights, professional football games, baseball games such as those played by the Braves in Milwaukee.

But the economic implication of subscription television has, perhaps, fundamentally more important consequences from the public interest standpoint than the fact that it will be able to provide mass entertainment of the type described, not now available on television. With the ability of subscription television to subsist on limited audiences, it can devote itself to programs having only a specialized appeal. Opera and ballet, for example, have not demonstrated their ability to attract mass audiences of 5 to 7 million people. But I am confident that in the New York area alone, with its more than 3,500,000 television sets—which I understand is now about 4½ million—programs of this character could easily attract an audience of 100,000, sufficient to support their presentation. The same thing would be true of music and classic theater presentations, while the tentacles of one's imagination slip as they try to grasp the impact of subscription television in the field of education.

Mr. COX. It is not conceivable though, is it, that you can put on a program for an audience of a hundred thousand in New York City with as much return to all those concerned in subscription television as you can by putting on an entertainment which would appeal to millions of people all over the country? There could not possibly be as much differential in the charge between one program and another as to allow for all that.

Mr. LANDIS. I am not sure that I get your point now.

Mr. COX. I take it there would be a top limit beyond which you would not propose to charge anyone for subscription television. Do you have any such figure in mind?

Mr. LANDIS. I doubt whether you could collect four or five dollars.

Mr. COX. I understand that the telemeter coin box will only go to $2. Do you have some such limit in mind?

Mr. LANDIS. No, there is no limit of that nature of a mechanical type. What you can get for a television performance is rather hard to guess. I do know, and I did make a personal examination of this, that in the last Rocky Marciano fight they were charging at drive-in theaters as high as $15 a car and individual seats in individual theaters were running at $4 to $6.

Some people pay under certain circumstances. Now, of course, if you disseminate that entertainment more widely than we do with so-called theater television, the likelihood is that the price will drop because that sense of exclusivity—sort of special privilege—loses its value. I do not know what you can get for a television program.

Mr. COX. As you take this program out of New York, however, in order to broaden your audience, then you are going to run into the telephone companies' cable charges.

Mr. LANDIS. That is right.

Mr. COX. And the expenses of purchasing time on stations in additional markets, so that you will increase all of your costs except the original programing costs which is a fixed item.

Mr. LANDIS. That is a fixed item but at the same time the amount of revenue that you are likely to get from taking it out would probably beat the line charges considerably, and since you have no more additional program cost it might be available for that purpose and you might even, we will say, sell the program, if you could sell it in Pittsburgh and Cincinnati, at a lower price than you sell it in New York.

Mr. COX. Do you have any idea what would be a cost to a subscription consumer of a typical program of, say, the Metropolitan Opera?

Mr. LANDIS. Yes; I do have an idea. We spent considerable time with the Metropolitan people inquiring as to what it would be, and I think for around from twenty-five to thirty thousand dollars, provided that it was not an intermittent affair so that you had a regular schedule for it, you could carry opera in reasonable fashion.

Mr. COX. And you think that that figure, plus the costs of transmission, could be supported by this audience of a hundred thousand?

Mr. LANDIS. I think it could be supported in the New York City area alone. You cannot get a seat today at the Metropolitan Opera for the balance of the season—well, you probably cannot get one next fall. The demand is there.

Mr. COX. Well, I return now to my original question. Suppose you charge this audience of a hundred thousand viewers $3 so that you have a gross income of $300,000 of which you are going to have to spend twenty-five or thirty thousand dollars for the program, plus the administrative charges, the time charges, the station and other technical expenses.

Mr. LANDIS. Which would probably run very high there because you would have an hour there, that may be sixty or seventy thousand dollars.

Mr. COX. So you get your basic costs up to at least a third of your expected gross in New York City. Now aren't there other programs of a broader appeal which you could offer to the owners of these four and a half million sets which would produce higher net revenues to the subscription programer than he can ever hope to get from catering to the tastes of a hundred thousand opera lovers?

Mr. LANDIS. Yes; I imagine there would be, but they would be limited. They would be rather limited—I am not sure that we can produce entertainment that will be—that 15 million or 25 million people will pay for at 50 cents or a dollar a throw. That type of entertainment is pretty rare.

Mr. COX. To the extent it exists it would be natural to suppose that the subscription programer will provide that type of programing, simply from an economic compulsion, unless it is proposed there be some type of limitation imposed by the Federal Communications Commission on the type of program that can be offered.

Mr. LANDIS. I would think the same principles—even more radical principles—would apply to the licensing of subscription television as to ordinary television, namely, that you cannot present a program without having some reference to programing for the public interest as well as for private profit.

Mr. COX. As I understand your suggestion, one of your arguments for subscrpition television is not that it will provide the same thing, but a higher type of programing, and in order to do that it will have to furnish programing that will appeal to more restricted audiences. The point I am trying to get at is whether this can ever be achieved unless the Commission adopts limitations on the kind of programing that subscription television can furnish by specifying that it will be of certain types and in certain proportions.

Mr. LANDIS. My point there is this: Say you have 40 hours of programing to fill a week. I do not believe you could fill 40 hours of programing of that nature with the kind of programing that would appeal to millions of people and for which millions of people would pay a certain sum of money.

You might be able to fill 6 hours of the 40 hours. You would then have a balance of thirty-odd hours. Now that thirty-odd hours can be used, in my judgment, economically by this type of specialized programing that I have been talking about. It can be used profitably that way and that type of programing cannot be put on today profitably.

Mr. COX. Now you mentioned the figure of 40 hours. That is roughly one-third of the program time of a typical television station per week. Is it your suggestion that the number of hours of subscription programing offered by a television licensee shall be unlimited by the Commission, or that the Commission might impose restrictions upon the maximum amounts of such programing that can be made available?

Mr. LANDIS. In our proposal to the FCC we have suggested a time limitation of this character and we also suggested, not a time limitation, but a limitation as to what time of day would be available.

Mr. COX. Well, was it this 40 hours?

Mr. LANDIS. It was 40 hours.

Mr. COX. And what were your limitations as to periods of the day?

Mr. LANDIS. I think about a third of it was to be not during what might be called the evening quadrant.

Mr. COX. That is that would leave two-thirds or somewhere in the neighborhood of 25 hours, which would be 3 hours a night, 7 days a week.

Mr. LANDIS. Yes.

Mr. Cox. Which would substantially absorb all of the prime time of the station offering this program.

Mr. Landis. Yes, of that particular station.

I would like to cite one actual instance to illustrate my point. Advances in medical science in recent years have been rapid and significant. There is, however, a definite social problem in educating the mass of doctors to the developments that have taken place with regard to new drugs, new methods of treatment, and new operating techniques.

A year or so ago Skiatron, with the help of the New York Academy of Medicine, put on an hour's show over WOR, all of which was done by eminent medical practitioners and half of which was devoted to an operation. The program was scrambled and decoders were placed at various points in the New York area where doctors were invited to assemble. The program was such a success that the New York Academy of Medicine and other professional associations supported the pending petition before the Federal Communications Commission in support of subscription television.

The question that arises is why a program of this nature cannot be carried by the existing system. The answer to this is twofold. In the first place, there are only about 20,000 doctors in the New York area. This is too small an audience to attract an advertising sponsor; even too thin to justify a sustaining program. It is sufficient, however, to support a subscription program, and few doctors would hesitate to subscribe to a continuing program of this character that they can view at their homes and at a convenient hour. Secondly, some of the programing, such as an abdominal operation, is not of the type that should be generally broadcast. But broadcast in a scrambled fashion, and limiting the decoding cards to professional men, just as subscriptions to medical journals are limited, offends no one and permits the type of dissemination of modern medical knowledge that a community so desperately needs.

Mr. Cox. Now this, then, is the situation you referred to earlier where you would issue during the current month a special card available only to medical practitioners which would make available this particular series of programs.

Mr. Landis. That is exactly what I had in mind.

Mr. Cox. It is also true though, isn't it, that at the time that you are taking care of the requirement of these 20,000 doctors, the particular television licensee broadcasting this program will provide nothing for the rest of the public.

Mr. Landis. He cannot do it at the present time, I suppose, until some device of multiplex comes into existence and that seems quite a ways away as yet. Obviously, you cannot carry two programs at the same time on the same screen.

Mr. Cox. So that at the same time that you have economic pressures to put on programs with broader appeal to the extent that they are available, you would also have some pressure from viewers, at least during prime evening hours, to provide a kind of programing that they would be interested in?

Mr. Landis. Yes; you would have that pressure, undoubtedly. In the medical field, curiously enough, a time that seems to be rather preferable to the doctors is around 11 o'clock in the morning. They seem to be assembled in the hospitals or at their officers or something of that type and the evening is not regarded by the men who did that programing for us as a particularly desirable time.

Mr. Cox. You cannot get too many of them together in one place, though, or it is going to reduce the revenues?

Mr. Landis. They would be in their homes. We only had available a certain number of limited decoders which we spread around in a limited area.

How many audiences of that type can be economically served by subscription television is any man's guess, but it is not beyond the bounds of realistic imagination to envisage audiences large enough to support a course even in differential calculus. The evidence of a widespread demand for adult education is overwhelming, and the contributions that subscription television can make to the fulfillment, fires, as I have said before, the imagination.

The objections that the networks make to the authorization of this system do not, except for propaganda purposes, rest on the intrusion of subscription television on "free air" broadcasting, for, as I said before, subscription television is perfectly willing to limit itself, at least for a reasonable period, to channels not now capable of effective utilization.

Mr. Cox. What would such a reasonable period be?

Mr. Landis. We suggested that the limitation be absolute for a period of from 3 to 5 years. After that it might be desirable to reconsider the entire situation and see whether or not that limitation should be changed, altered, or abandoned.

The real objection that the networks have rests upon the fact that a day possesses only 24 hours. What is limited is audience time and not air frequencies. The networks, for all practical purposes, are today absorbing this audience time, and the vast television audiences of the Nation are in a very true sense their captives. They fear and resent any effective competition for this audience time, and they fear any fractionalization of that audience time by the capacity of a competitive television station to appeal to specialized groups, who instead of viewing westerns, crime stories, and I Love Lucy, might be potential buyers of toothpaste or cosmetics or beer. Their basic plea is to maintain their existing dominance in the field of telecasting—a dominance that approached oligopoly if not monopoly.

Mr. Cox. Well, at the present time they are competing, in at least 2 markets, with 4 independent television stations for the attention of the audience and I assume it is only because you feel you can offer attractions of a kind that are not now available to those four stations that you feel that they would suffer any injury from your entrance into the market?

Mr. Landis. That is exactly it.

Mr. Cox. Well, now I assume that one consequence of any dilution of their audience would be that the figure—the cost per home tuned in—which you have quoted, of some seven-tenths of a cent would be increased.

Mr. Landis. It might very well.

Mr. Cox. To the extent that you were able to divert their audience. Now is there a danger, in so doing, that you will render the advertising service which they perform uneconomic so that the funds now channeled into television advertising would be diverted to other mediums?

Mr. LANDIS. You see the danger that they face is this: Say today they can appeal by a particular program to 15 million people. If we intrude and take say 2 million of those people away, their potential audience is limited to 13 million people. Therefore, I as an advertiser would pay less for a program that only reaches 13 million people than 15 million people. That in turn has its effect upon the amount of money that they can put into the program. It does. It will have that type of effect.

Mr. COX. In other words, as the audience available to this sponsored program is reduced, either costs must be reduced, which means the program becomes even less able to hold its audience, or the charge made to the advertiser must be increased and may eventually reach a point where he will not pay it?

Mr. LANDIS. That, of course, must be qualified by one other thought. I do not want to dodge this fact because we should face it, but I think it has to be qualified by another thought, namely, that the type of programing that we envisage may very well appeal to groups of people who are not tuning in on the existing system, the existing programs. I think there is a vast group of people of that type.

No one can size it up or tell you how many millions there are, or hundreds of thousands, or anything of that type. Only experience will show. I recognize, and I do not think one can dodge the fact, that if we successfully compete for an audience that remains static, naturally we reduce the value of the programing to the advertiser and he will pay less. That after all is a doctrine of competition. I think it is in the public interest that the public be able to choose between the various different fares that are offered to it.

Mr. COX. Would the public interest be served, though, if in the process of choosing, to the extent of buying a certain limited program of particular attraction at the outset, you set in operation a chain of consequences which will gradually weaken sponsored support of television to the extent that either the programs made available without charge are reduced or that sponsors in large numbers start abandoning the medium, either going to others or perhaps petitioning the FCC to eliminate the restriction that you suggest on commercials so that they can ask to be permitted to commercialize on your programs, since that is where the audience is?

Mr. LANDIS. That might happen. I think that is somewhat pushing the potential consequences of the introduction of subscription television too far.

The degree to which it will effectively reduce what you might call the circulation of the networks at the present time—I doubt whether it will be too heavy. It may be one night, or at any particular time, but when you consider that the prime fare of subscription television, day in, day out, will be the specialized audience type of thing, the impact of that upon the networks' audiences cannot be too severe.

Mr. COX. But as a matter of fact, no one really knows.

Mr. LANDIS. No; no one can tell you one way or the other.

No proponent of subscription television, to my knowledge, seeks any exclusivity for his particular system. We in Skiatron would willingly see as many manufacturers as possible turn out decoders.

Like Gillette, our prime sources of revenue will be the programs or blades and not the razors. We have told the Federal Communications Commission that such patents as we possess in the manufacture of decoders will be freely licensed to all comers on a reasonable royalty basis. We welcome the thought of competition, not merely with the existing television broadcasters but among ourselves. We know that our survival will depend not upon how much toothpaste or cereal our programs will sell, but upon our ability to create and transmit programs for which viewers will pay a price despite the fact that they will continue to receive other programs without charge. On this gamble, we are asking for the right to risk our money—not that of the public.

Mr. Cox. Now does that mean then that you would contemplate that Zenith, Telemeter, and Skiatron might all be authorized by the Commission to put their systems into operation?

Mr. Landis. Yes; just as we have different manufacturers now manufacturing different radio sets.

Mr. Cox. Now can one set be subject to three of these decoders?

Mr. Landis. That is clearly possible and also it may be that the Federal Communications Commission would establish certain standards which everyone would have to meet, the way it has done in the television field.

Mr. Cox. And sometimes those standards result in only one patent holder being able to meet them; don't they?

Mr. Landis. Well, they shouldn't. With adequate cross-licensing you should be able to protect against that situation.

Mr. Cox. Isn't there danger that the public will be adversely affected if three separate systems are offered for sale in the market in a given community? Wouldn't at least some local specialization be desirable in order at least to eliminate confusion and the duplication of cost?

Mr. Landis. I doubt that. Take New York City: You have three baseball clubs in there offering their services to that public. You have your Brooklyn fans. You have your Bronx fans, and you have the Polo Ground fans. I cannot see anything radically wrong with three different systems competing within a single area for entertainment. They may or may not survive, one of them.

Mr. Cox. Well, in the first place, though, at least to the extent that the cost of a decoder is passed on to the set owner, if he has to buy three decoders in order to get all of the subscription programs available, you have multiplied his expense.

Mr. Landis. Yes; you have, if that is the eventual answer, but he does not have to buy all three. He may, if he chooses, buy all three, and then there is the other possibility that, just as today you have one instrument capable of receiving both VHF and UHF, you may develop exactly this kind of thing in that field, too.

Mr. Cox. You contemplate the manufacture of a system which can differentiate between all of these different broadcasts to the extent that it can actually apportion out the funds.

Mr. Landis. No; what I contemplate is this: There may be standardization in the field of reception. That does not mean that you might not have a few, or enough frequencies in the particular area, to have competitive subscription television in that area.

In other words, I can tune in on, we will say, station X which is broadcasting Skiatron's system. Then my revenue would go into

Skiatron. I can tune into station Y which is broadcasting Zenith's program. Then my revenue would turn into Zenith.

Mr. Cox. But, to divide that revenue, there has to be something in the set to determine which the man is watching.

Mr. Landis. We have that.

Mr. Cox. But you have it in your set—in the decoder you manufacture, and Zenith has it in the decoder they manufacture.

Mr. Landis. I do not think there would be too much ingenuity required to standardize the thing so as to enable it to be a useful device for the transmission of any subscription television program.

Mr. Cox. Now as I understand it, it is proposed that each one of these companies is going to go into each community. Each company has to set up its own local franchise holder, who will either sell or install the decoders. Each has to make contractual arrangements with television licensees for broadcast time, and each has to have connections with some kind of a local or national program source which will feed the programs into the system. And if you have three of these instead of one, then you will have trebled, approximately, the costs of providing subscription fare to the public.

Mr. Landis. I do not see why you say that, that it would increase the cost. Of course, one community, a particular community may not be able to stand more than one movie theater. New York, for example, can stand a great many different theaters. They all have their different means of buying tickets. I do not think that that is a discouraging matter.

Programing of the subscription television type, which has to depend upon public acceptance, seems to me to have a very distinct public virtue. Its content and its appeal will not be controlled by considerations of advertising value that may have little relationship to art or culture or education. And it is not unfair to suggest that under these circumstances a new approach to programing may come into being. If newspapers today were limited to the throwaway type, or the theater or the movies had no box office but only were gatherings for the intermittent hawking of products—a sort of glorified series of medicine shows—we would have an atmosphere in these fields somewhat akin to that which prevails in television today. The consequences of creating a new atmosphere, a new plane of reference, may very well be permeating but are certainly not to be feared.

I shall not go into the proposed methods of operation of subscription television, or the reaction of the public to our proposals as gaged by numerous surveys and experiments, as other proponents of subscription television will touch on these. But I do, in closing, wish to say a word on the position of our proposals before the Federal Communications Commission. Inasmuch as that Commission only a year or so ago, in a letter to Chairman Crosser of the Committee of the House of Representatives on Interstate and Foreign Commerce, stated that they had the power under the Federal Communications Act to authorize the encoding of television signals as a phase of broadcasting, and inasmuch as this same opinion was voiced before this committee by the present Chairman of that Commission and Commissioner Lee, I think it is unnecessary to dwell on the legal issue of whether subscription television can be authorized as a broadcasting service under the present law. I have, however, prepared a short brief on this point which I would like to leave with the committee.

Senator BIBLE. It may be included in the record at this point, Mr. Landis.

Mr. LANDIS. Thank you.

(The information is as follows:)

THE JURISDICTION OF THE FEDERAL COMMUNICATIONS COMMISSION OVER SUBSCRIPTION TELEVISION

THE COMMISSION CAN ACT NOW

1. On September 13, 1954, Skiatron, in its petition to the Federal Communications Commission, stated:

"The Commission has authority under title III of the Communications Act of 1934, as amended, to adopt such regulations as might be required with respect to matters such as the number and type of hours during which subscription programs could be broadcast by any station, the number of stations in any community which could engage in subscritpion operations at any one time. It has authority also to approve transmission standards for such operations.

"The Commission can therefore mold the use of subscription television to meet the urgencies of the UHF station. Only a determination to act and to act promptly is required. Technically the problem has been solved. All that is needed now is the authority to employ subscription television in the area of its greatest need."

Even today, there can be no reasonable dispute concerning the Commission's power to authorize subscription television. (Chairman McConnaughey's statement before this committee, February 21, 1956, transcript 611, printed record, p. 204.) That power is invested in the Federal Communications Commission by the Communications Act of 1934, as amended; accordingly, there is no necessity for further congressional legislation to establish this authority.

Congress, by creating the Federal Communications Commission, established a body of skilled experts in the field of radio communication with broad jurisdiction over all channels of interstate and foreign radio transmission. (Sec. 1 of the Communications Act of 1934 creates the FCC and authorizes it to "execute and enforce the provisions of the act." Sec. 301 prohibits the use of any apparatus for the transmission of communications by radio in interstate commerce, except in accordance with the provisions of the act and pursuant to a license granted under the act.) Within this broad jurisdiction, the Commission has not only the authority to act, but also the obligation to act on subscription television.

2. Further, the Federal Communications Commission has received certain directions from the Communications Act of 1934, as amended, which clearly substantiate the Commission's jurisdiction over subscription television.

Section 303, in setting forth the Commission's general powers, directs the Commission "* * * from time to time, as public convenience, interest, or necessity requires," to prescribe the nature of service to be rendered by each class of stations (303 (b)); regulate the kind of transmitting apparatus to be used (303 (e)); encourage the larger and more effective use of radio in the public interest (303 (g)); and make such rules and regulations not inconsistent with law as may be necessary to carry out the provisions of the act (303 (r)).

Section 4 (i), in broad terms, authorizes the Commission to "perform any and all acts, make such rules and regulations, and issue such orders, not inconsistent with this act, as may be necessary in the execution of its functions." Skiatron's proposal accomplishes these purposes not only by improving the quality and range of television programing, but also by creating a means for UHF and nonaffiliated VHF stations to secure that economic support so essential to their survival as part of our economic system. In fact, the Commission would be remiss in its duties if it ignored the potential of subscription television in creating a truly nationwide competitive television service.

SUBSCRIPTION TELEVISION IS BROADCASTING

3. Under these broad statutory powers, the Commission has the authority to approve and regulate subscription television whether subscription television be classified as a broadcast or nonbroadcast service. (The Commission recently authorized nonbroadcast services in the broadcast band as an economic measure to help FM licensees. (Functional Music, see FCC public notice 17751, March 22, 1955, and report and order in docket No. 10832, released March 22, 1955.)) However, subscription television, as proposed by Skiatron, clearly constitutes a broadcast service within the meaning of section 3 (o) of the Communications Act, as

amended. This section defined "broadcasting" as "the dissemination of radio communications intended to be received by the public directly or by the intermediary of relay stations." Neither this definition nor any other provision in the Communications Act of 1934 makes the absence of a charge to the listeners a prerequisite of broadcasting. The Commission has already recognized this by authorizing a radio subscription service as a broadcast operation.

Muzak Corporation (8 F. C. C. 581). Therein, the Commission stated:

"The service which this applicant proposes will be available to the general public; any member of the public, without discrimination may lease the equipment to receive the service. The distinguishing feature will be that those receiving the programs will pay directly rather than indirectly therefor. Operation of a station in this manner is within the definition of broadcasting" (8 F. C. C. at p. 582).

Like reasoning requires a determination that subscription television constitutes broadcasting.

4. Skiatron's programs are intended to be received by the general public; in fact, the very success of subscription television is dependent upon its ability to serve the general public. Further, Skiatron proposes to transmit a high quality program service for the public as distinguished from individualized messages. Under such circumstances, Skiatron's proposal satisfies all the requirements of broadcasting under section 3 (o) of the Communications Act of 1934, as amended. As the Commission stated in its comments on H. R. 6431, 83d Congress (a bill introduced by Representative Hinshaw to redefine "broadcasting" so as to make the absence of a charge to the general public a prerequisite to broadcasting; the bill died in committee).

"It would appear that the primary touchstone of a broadcast service is the intent of the broadcaster to provide radio or television program service without discrimination to as many members of the general public as can be interested in the particular program as distinguished from a point-to-point message service to specified individuals. If this is true, subscription services should properly be characterized as a type of broadcast service. For while particular subscription programs might have a special appeal to some segment of the potential audience, this is equally true of a substantial portion of the programing now transmitted by broadcasting stations."

5. A review of the early history of the radio industry, as well as the legislative history to the Radio Act of 1927, supports the premise that broadcasting is not to be restricted to programing received by the public without charge.

In 1927 radio was still young, and the means of remuneration for broadcasting had not, as yet, become established. Accordingly, Congress left it up to the broadcasters themselves to determine the source of their revenues and clearly contemplated that broadcasters might select as one of their choices a direct charge to listeners, and under the Radio Act of 1927, the questions of charging listeners was left solely to the individual licensees. The development of advertiser-sponsored television was the result of business practice and at no time stemmed from any legislative requirement. No change in this policy is evident in either the 1934 Communications Act or in the 1952 amendment to the Communications Act.

6. This congressional intent to free broadcasters from strict Government regulation over their business decisions has been recognized by the Supreme Court in the Sanders case (*Federal Communications Commission* v. *Sanders Bros. Radio Station*, 309 U. S. 470). There the Court stated:

"But the act does not assay to regulate the business of the licensee. The Commission is given no supervisory control of the programs, of business management, or of policy. In short, the broadcasting field is open to anyone, provided there be an available frequency over which he can broadcast without interference to others, if he shows his competency, the adequacy of his equipment, and financial ability to make good use of the assigned channel."

7. The business of broadcasting was left in the hands of the individual licensees. FCC Commissioner Robert E. Lee recognized this when he recently publicly recommended that subscription television be subjected to the trial of the free market price See also Commissioner Lee's testimony before this committee, January 26, 1955, transcript, page 66. There is no reason in law or fact to reject the viewpoint that the public be given the opportunity to test the merits of subscription television.

Report of proceedings held before the Committee on Interstate and Foreign Commerce Television Inquiry:

January 26, 1956, transcripht, volume 1, page 66 (printed record, p. 27):

"Commissioner LEE. I believe that you should give some consideration, for example, to subscription television as a related problem. That might sound strange, but after looking over the docket and discussing this thing with about everyone I could find, I feel there is some merit to considering subscription television on the UHF only under certain limitations, since their problem [the UHF] is a matter of revenue.

"If this thing is good, I feel that maybe it should be given a trial on UHF only, and under controls such as a percentage of the broadcast time. If you can broadcast on subscription television 10 percent of the time you are on the air, if you want more time for subscription, you have to give more free, and that sort of thing. Perhaps even consideration on some kind of limitation on the rates, and certainly not permit it where there is only one service; and that sort of thing. But I would hope that you would give it some consideration."

Transcript, volume 1, page 68 (printed record, p. 28):

"Commissioner LEE (continuing). My suggestion is to consider the limitations [to UHF] only as a beginning, perhaps eliminating the restrictions later. If this thing is in the public interest, you would presumably extend it, so that everyone could see it. It just occurred to me, reading these petitions, that since it is a matter of revenue, and the proponents say this is like Coca-Cola, there are so many millions of people even at a dime, if you can give them revenue they can stay on the air and provide a free service as well as the subscription service.

"Senator PASTORE. Until you decide the overall policy?

"Mr. LEE. That's right, sir.

"Senator PASTORE. I see."

February 21, 1956, transcript, volume 4, pages 515–516 (printed record, p. 166):

"Chairman George McConnaughey submitted written answers to questions raised by Senator Andrew F. Schoeppel on January 26, 1956.

"'Question. What is the status of subscription television, and what are your views?

"'Answer. The Commission instituted the subscription television proceeding on February 11 of last year to explore the question of whether it would be in the public interest to permit television stations to engage in subscription television operations on a regular commercial basis. Interested parties were invited to submit their comments in order to assist us in resolving the numerous legal, technical, and policy questions involved. When the time for filing comments expired, on September 9, 1955, the Commission found that the comments received totaled approximately 25,000 formal pleadings and less formal submissions which filled nearly 80 reference volumes. This is more than has been filed in any other docketed case in the Commission's history. Because of the nature of this proposal and the many questions and problems to be resolved, including the question of whether legislation by the Congress is called for, I am unable to promise the early conclusion of this proceeding. Moreover, our consideration of this matter must always yield to the need for the earliest possible resolution of the question before us in our current review of the established system of television allocations.'"

February 21, 1956, transcript volume 4, page 611 (printed record, p. 204):

"Mr. Cox. Without regard to the merits of the proposals, in the light of Mr. Lee's statement during the first day's hearing that subscription television might be a possible answer to the UHF problem, I would like to ask whether the Commission is still of the opinion expressed to the House Committee on Interstate Commerce in May 1954—that if it were to decide that a subscription service was in the public interest, does it feel it has legal authority to approve and to adopt a rule so providing?

"Mr. MCCONNAUGHEY. I think so.

"Mr. Cox. You are still of that view?

"Mr. MCCONNAUGHEY. I think so."

February 21, 1956, transcript volume 4, pages 622–623 (printed record, p. 207):

"Senator PASTORE. Isn't one of the important issues in this rulemaking process that you are undergoing now, with reference to subscription television the question as to whether or not you have the authority under the law?

"Mr. MCCONNAUGHEY. That question certainly does come into it, Senator. I say it does come into it. I think the general feeling is that possibly we do have the authority. But it is not too clear cut."

Mr. McConnaughey then refused to allow his staff legal adviser to answer a question as to whether or not the Commission had the authority to regulate subscription television.

Mr. LANDIS. There is an administrative phase of this problem that, however, should not be overlooked. Our own petition for an amendment of the existing rules was filed in September of 1954. Other petitions were filed shortly prior and subsequent to ours. A rulemaking proceeding on this subject was instituted by the Commission in February of 1955. Briefs and counterbriefs were filed with a closing date of September 9, 1955. Since then there have been 7 long months of silence.

As a former bureaucrat, I realize the loads of work that an administrative agency may be called upon to assume. I realize also that this proceeding has brought many comments from the public, due largely to the efforts of proponents and opponents to engender support from the public for a particular viewpoint. The value of the vast majority of these, if they have any value, can be extracted by the simple process of enumeration.

The delay to date is not too significant, but a continuation of this delay will have serious consequences. Not only is the institution and conduct of a proceeding of this character an expensive proposition, but maintaining in existence while the proceeding is pending a group of engineers, scientists, and executives, is practically essential if one wants to be in the position to go ahead full blast, if, as, and when the green signal is given. We are a small company, financed primarily with public money that has been openly invested on a known speculation. That, in my opinion, is right and in the tradition of our system of private enterprise. But, as delay continues, we find ourselves in a position where this financial drain continues and, if continued too long, the investors can easily end up without even having had a run for their money. The opponents unfortunately are not in that situation. Their aim is to maintain the status quo, and the status quo provides them with continuing revenues. No decision, in short, is as good as a decision in their favor.

What this committee can do about this situation, I do not know. But besides us—the proponents of subscription television—there is the UHF broadcasting industry. Like us the absence of any relief and the continuing pendency of their problem has already driven many of them to the wall. Perhaps there is no ultimate sound relief for the UHF situation. Our own proposals, however, we believe will afford a substantial measure of relief. Certainly, action and not inaction is called for and we hope devoutly that this committee will agree with us in that viewpoint and exert at least its moral influence in behalf of the formulation of a program now.

In closing, I want to express my thanks to this committee and its staff for this opportunity to lay before them the cause of subscription television, a cause which I believe is intertwined with those problems whose solution is the committee's major concern.

Senator BIBLE. We are very happy to have your statement, Mr. Landis.

Senator Purtell, do you have any questions?

Senator PURTELL. No questions.

Senator BIBLE. Senator Potter?

Senator POTTER. Mr. Landis, I regret I wasn't here earlier to hear the majority of your statement. I assume—Are you recommending a subscription plan similar to the Zenith plan?

Mr. LANDIS. Basically similar to the Zenith plan. As I indicated, there are certain mechanical differences between Zenith, ourselves, and Telemeter. The basic principles of operation are, however, the same, and as I said before, certainly we are not seeking a monopoly or an exclusive position here. We are in a sense joining with them in the hope that the Commission will amend its regulations so as to permit the encoding of the television signal.

Senator POTTER. How much would this cost the consumer or the receiver?

Mr. LANDIS. We figured, on the basis of estimates that we have gotten from manufacturers, and we have been rather careful on these estimates, these aren't just casual things, that it would cost the viewer $40 for a combination decoder and UHF converter. That does not count, however, the cost of any new antenna, if he needs those.

Senator POTTER. That is the cost for conversion of the individual set?

Mr. LANDIS. Conversion plus a decoding unit.

Senator POTTER. Then how much would it cost—say Mrs. Jones wants to see an opera in the evening? Is it a card system that you use?

Mr. LANDIS. Yes.

Senator POTTER. How much would that cost her to see the opera?

Mr. LANDIS. That is something you have to work out. We have figured on charges running anywhere from 25 cents to $1.50 or $2 for various type programs.

As to operas, it would depend upon the estimated audience that you have; your estimate of revenue has naturally got to be large enough to deal with the cost of the programing. Opera is a fairly expensive type of programing.

Senator POTTER. Of course the question that always comes up in considering this type of television is whether the public interest is being served if they pay for the service, and also the amount they would have to pay. Now, there would be a lot of difference between a program that might cost 25 cents for an hour and a program that would cost $2 for an hour, and I would think that that question is one that would have to be resolved.

Mr. LANDIS. I don't see how you can resolve it in advance. How much do we pay for a good show? How much do you pay extra for a musical as against an average drama? There are variations in price because musicals are more expensive to put on. How much do you pay for a road show like the Robe as against the ordinary A picture? Those are matters that are determined in our economy by the counterbalancing forces of demand——

Senator POTTER. I would like to observe that you would be taking a frequency that is now being used for actually free television.

Mr. LANDIS. No; that is our point; we wouldn't. We are asking to work on frequencies that are not being used at the present time, so that your Mrs. Smith, who might be interested in seeing the opera, if she didn't want to see it, all the other free programs would still be available.

Senator POTTER. You would have to have an allocation of a frequency, if it is not one being used, it is one that could be used.

Mr. LANDIS. It is certainly one that could be used, and under our present economic situation they are not being used, and there are hundreds of those available throughout the country.

Senator POTTER. Of course, sometimes I think that the advertising is much more entertaining than the program which we are watching.

Mr. LANDIS. That I don't dispute. I get a kick out of some of the advertising on cosmetics occasionally.

Senator POTTER. I do agree, however, I think that there is a tendency on the part of either the network or the individual station to try to squeeze in too much advertising, and I think they are killing the goose that laid the golden egg by continuing that practice. I don't think it is good advertising.

Mr. LANDIS. Well, some of it, I quite agree with you, is not good advertising. On the other hand, there is certain of it that is quite effective.

Senator POTTER. When you break into a show every 5 minutes for a minute spot it is disturbing, to say the least.

Mr. LANDIS. Yes.

Senator BIBLE. Mr. Landis, as I understand you from your first statement, the consumer's investment in this subscription television experiment would be approximately $45 plus a high antenna if you are using UHF; is that correct?

Mr. LANDIS. Yes; if he needs the high antenna. That depends upon the particular circumstances. He may or may not need the antenna. It would be about $45.

Senator BIBLE. The one thing I am not clear on is whether or not you have any general indication of what the public would be paying for these programs on a month's basis. You say you would limit your broadcasting to a 40-hour week. That is all you are asking.

Mr. LANDIS. I doubt whether we could fill 40 hours a week for a considerable period of time, and you as a consumer might not be interested in this particular type of program. You might only buy 1 or 2 hours, or 3 hours of time, per week.

Senator BIBLE. The thing that baffles me in your statement is this: You say that before I can enter this subscription television field I must invest $45 in the decoder and converter. Now, before I invest that $45, it seems to me that I should have some indication of what I am going to pay for the programs which I am going to be receiving.

Mr. LANDIS. Oh, unquestionably, Senator, you will, because you won't shove out $45 without knowing what your chances are, what you are going to get, and at what price.

Senator BIBLE. But you have no indication as to what those prices would be as of now?

Mr. LANDIS. We have estimated. None of our prices have ever gone over $2. But we have estimated potential audiences in the New York City area for these various types of entertainment and estimated costs with regard to it, and then come out with what we thought was a reasonable price.

Senator BIBLE. Does your study go beyond the field of opera, where you say it is a specialized field?

Mr. LANDIS. Oh, yes; we have gone into athletic events of all types.

Senator BIBLE. Attempting to tie up a world-series game exclusively, for instance?

Mr. LANDIS. No; actually what we are interested in is primarily in dealing with those events that you don't now see in New York City, like the pro football games. I believe you can get quite an audience for that purpose, and at the same time not damage severely the box office at the arenas. We have gone through a series of programs of this type, estimating costs, potential audiences, and the like, and, therefore what prices the public would have to pay in order to see them.

Of course, all of that depends upon the area that you serve. If you serve, say, Cincinnati as against New York, you have a different problem on your hands. You have that in the entertainment field today. You cannot get the prices in Cleveland, or even in Chicago, that you can in New York for theaters and movies.

Senator BIBLE. I recognize what you are saying, but when you are talking about any type of a sizable audience you still have a sizable investment by each television viewer, to the extent of $45 a person or a set.

Mr. LANDIS. That is right. Yet, I don't think it is sizable from the standpoint of an owner of a television set. He not uncommonly will spend $20 or $25 for some gadget that he thinks will improve his sense of vision.

Senator BIBLE. Of course, what you are saying is you are perfectly willing to take the risk, from the standpoint of Skiatron, to go ahead and see whether or not this does prove out profitably.

The thing that bothers me is, after you sell it to the television viewer on a subscription basis, and then he puts out $45, how far ahead does he have an indication of these programs he is going to pay for, for which he has already paid $45?

Mr. LANDIS. We have considered, and we may eventually turn to the idea of leasing these decoders rather than suggesting their purchase. Admittedly, the problem of leasing carries with it a considerably greater burden than of outright purchase, and it involves a larger capital investment on the part of the subscription television operator if he has to carry the large inventory of television decoders that otherwise he might dispose of to the public.

So I say our present plans are that we think that purchasing is perhaps the best move in this direction, but it may be that when we actually have a chance to operate we will be able to gather together sufficient capital and run a leasing scheme instead. I cannot guarantee any of these things, because you can't tell.

Senator BIBLE. I realize you are in a new field.

Mr. LANDIS. You cannot tell what the economics of a situation will demand of you.

Senator BIBLE. As I understand your statement, you have completely submitted your case before the FCC some 7 months ago.

Mr. LANDIS. That is right.

Senator BIBLE. It has been under submission for some 7 months. Do you have any indication of when you might possibly have a decision from them?

Mr. LANDIS. None whatever. When I say we have completely submitted it, we have submitted everything that the FCC has asked for.

Senator BIBLE. You have rested your case; is that a fair statement?

Mr. LANDIS. I wouldn't be at all disturbed if the FCC would say: "Well, yes, you have submitted all this material, but here is one area we want to know something more about; we would like to reopen the hearing on this point." I think that is a perfectly intelligible admission, and nobody would have any objection to that, but what we fear is a delay of, say, 4, 5, 6 years, as happened in color television. By that time our tongues will be hanging so far out we will be completely parched.

Senator BIBLE. The stockholders will be a little unhappy.

Mr. LANDIS. Yes; I think they would be.

Senator BIBLE. Fine, Mr. Landis. Thank you.

Senator POTTER. Do you envision a nationwide coverage?

Mr. LANDIS. Yes, eventually. Of course you would have to start off in one area and, hopefully, in an area that would be sizable enough. We couldn't start off and have much of a chance, we will say, starting off in Grand Rapids, but give us Cleveland or the Philadelphia area or the New York area—those areas would be a fair test of how this operation could go.

Senator Potter. Of course, you always have a problem that enters into a question of this kind. If a person buys a ticket to the opera or the theater, that is private property. It is a private undertaking, a private capital investment; but you are using public property when you are using the airways. To charge the public for the use of that property presents another question.

I have never been able to answer to my own personal satisfaction as to whether the public interest would be served by charging the public for the use of public property. Now, it is true, you would be furnishing the programs. The programs are also utilized by people furnishing advertising. But I do believe there is a difference between selling that property to somebody to put on a program and to use part of it to advertise his product, and to take it for a program and to charge the consumer just for the program. I don't know whether there is a difference or not, but it does raise a question.

Mr. Landis. I have never worried about that too much. After all, we use the power of eminent domain to get property for the railroads, and the railroads sell tickets, and they charge for their services, and it is all in the public interest. The basic thing is whether this is in the public interest, and if the public doesn't like it we won't survive; that is obvious.

Mr. Cox. In connection with your suggestion that perhaps subscription can help save UHF, approximately how long do you think it would take for you to get into effective operation, assuming the FCC granted authorization?

Mr. Landis. We have estimated that we could be into effective operation—that is, operation to the degree of, say, a hundred thousand decoders to start with—within 9 months after getting the signal light.

Mr. Cox. All right; now, what markets would you propose to go into first? Are you going into those areas that have UHF stations on the air losing money?

Mr. Landis. Preferably there, because you may have an audience that is half sold already. Those would be attractive areas, provided that you had enough consumers there to pay the cost of programing. You have to have that base in order to get good programing, or you have to have enough consumers so that you have enough of a specialized audience in order to meet the cost of programing.

Now, areas where that would be possible, and where you have UHF already operating—there are some areas in the Middle West that I think of around through Kansas City and St. Louis where you already have UHF operations, where you might move in initially with a type of subscription television that might be effective.

Mr. Cox. How long do you think it would take before you would have enough decoders out and in use that you could actually start to carry the kind of programing that you are talking about?

Mr. Landis. You mean carry it economically?

Mr. Cox. Yes.

Mr. Landis. Of course, we would have to operate in the red for a considerable period of time. There is no doubt about that, just as television itself had to do that when it started. We have figured that within a year and a half to 2 years—take an area such as the New York City area—if the demand was there we could have anywhere from 1½ million to 2½ million decoders available, from a manufacturing standpoint.

Mr. Cox. That was a year and a half to 2 years?

Mr. Landis. Yes.

Mr. Cox. In that case, of course, you are going to have to get a new station to go on the air. There is no UHF station in operation in New York.

Mr. Landis. There is a frequency open. There are 3 frequencies open, 1 which is commercial, 1 which is educational, and the third which is sort of semieducational, reserved there at the moment, but not too strongly.

Mr. Cox. This would require the construction of a new station?

Mr. Landis. Yes.

Mr. Cox. And isn't it true that engineers predict some difficulties in New York City on account of the buildings which might interfere?

Mr. Landis. It might; and yet one doubts as to whether it is quite as serious as indicated; not perfect reception but still reception sufficient to justify the operation of it in that area.

Mr. Cox. Have you proposed to the Commission not only that you limit your initial operations to UHF but that you make your initial efforts in any specified localities, or class of localities?

Mr. Landis. No; we haven't done that. We have just indicated the UHF field, but I see no reason why the Commission shouldn't suggest operation in those areas.

Senator Bible. Thank you very much for your statement, Mr. Landis.[1]

Our next witness is Mr. Raibourn.

Would you state your name for the record, please?

STATEMENT OF PAUL RAIBOURN, INTERNATIONAL TELEMETER CORP.

Mr. Raibourn. My name is Paul Raibourn; I reside in Southport, Conn.

Senator Bible. I note that your statement is very voluminous. Now, I certainly have no objection to having the statement incorporated in full in the record. I am wondering if it might not be just as effective if you could highlight that statement, hit the high points on it? I don't want to in any way curtail your presentation, but if you feel that you can make as effective a presentation by having the statement incorporated in the record, and then highlighting it in your oral testimony, that would be appreciated.

Mr. Raibourn. I think I can probably do best by taking the first 4 or 5 pages, and excerpts from the rest of it.

---

[1] By letter dated April 25, 1956, Mr. Landis requested that certain documents filed by Skiatron with the Federal Communications Commission be incorporated in this record by reference. Accordingly, the following items, which have been retained in the committee's files, are hereby incorporated in the record of these hearings by reference:

1. Petition for institution of rulemaking, dated September 13, 1954.
2. Comments in response to notice of proposed rulemaking, docket No. 11279, filed June 9, 1955.
3. Reply comments, docket No. 11279, filed September 9, 1955.
4. Comments, docket No. 11532, filed December 14, 1955.

Senator BIBLE. That would be very satisfactory, Mr. Raibourn. Thank you.

Mr. RAIBOURN. I have been connected with television broadcasting since before the late World War, having helped start television station KTLA in Los Angeles and station WBKB in Chicago. I am still president of station KTLA. In addition, I am a director and treasurer of the licensee corporation which operates television stations WABD in New York and WTTG in Washington, D. C. I participated as one of the founders of the Television Broadcasters Association which subsequently merged with the National Association of Radio and Television Broadcasters in which I have continuously served as a director until the present time. In addition, I am vice president and director of Paramount Pictures Corp., and also chairman of the board of directors of the International Telemeter Corp.

I appreciate the opportunity your committee has afforded me to appear before you and discuss the potentials of subscription television. I wish to state at the outset that I have tremendous faith in television as a medium for public service, and the further economic development of our Nation's resources. The power and impact of television upon public attitudes is in my judgment only beginning to be understood. I have been an enthusiast for television for years. The same cannot be said of all of the organizations, even the largest ones, which will appear before you on this question.

If we look back only 7 years we will find one of the largest networks dragging its feet in television professing lack of faith and one proponent of subscription television saying that sponsored broadcast television could never get off the ground. They have both since served ably and well in helping television along, but the existence of such differences of opinion in the not too distant past should point out to everybody that there is nothing sure with respect to television except its growth and that, in considering its future, one must return to the basic fundamentals of the situation to be sure that he is drawing inferences which the future will bear out.

This committee, I am sure, recognizes that basic to every consideration in evaluating the problems relating to television is the public's stake in this medium. Those in the limelight of television who appear before you in opposition to pay-as-you-see television represent total investments of around a billion dollars in facilities and plant. According to the Commission's latest economic report on television investments, the investment by the networks and all television stations as of 1954 was only about $315 million. When the public fully converts to color, as it will do, the total investment of American citizens in this service through the purchase of receivers will be close to $30 billion. So I appear today to make the obvious appeal that the interest of the public whose investment will be at least 30 times that of the very vocal group which presently dominates television should control our thinking. In brief, I do not believe that the control of the bark should determine what the dog shall do. The preferred position of the vested interests, particularly the networks, should not determine public policy in this important and dynamic field.

The Federal Communications Commission has probably told you that the volume of paper and sound which has been presented for and against pay television far exceeds that on any other subject with which it has had to deal. I find it a staggering job to keep up with it myself, but I can boil my reaction down to amazement that this very simple proposal that the public, with its huge investment in receiving sets, should not be permitted to choose.

We are here making a fundamental and I think truly an American appeal for the doctrine of competition. I can understand the position of the networks in resisting change and progress. Their present preferred position through restrictive covenants and exclusive arrangements with their affiliates when combined with the existing limited channels of broadcasting affords them the opportunity to determine, by and large, not only what the public shall see and hear, but what shall not be made available. I plead for access by the public to any and all programs and events it may want, and access by any and all producers to the sets for which the public has expended so much. I contend that the authorization of pay-as-you-see television is progress. If it succeeds, it will inject a much-needed competitive force into this industry; and the public, with $30 billion of potential investment, will benefit.

As I shall develop later, if subscription television does not win public acceptance, only those companies which invest their funds and energies in making it available will suffer. If the existing network structure cannot face this new form of competition, I raise the question as to whether it deserves to survive in its present form.

Mr. Cox. In your opinion, do you think that there is substantial danger that this competition might drive them out of business?

Mr. Raibourn. I don't think there is the slightest chance of it happening. The networks have rendered a great service to the public so far, but I insist that in this dynamic field the status quo should not be irrevocably fixed and that the networks, like every other American commercial institution, should be subjected to as much vigorous and healthy competition as the limited facilities in this field permit. In short, the umbrella of governmental sanctions, through approval of exclusive contracts, option time, and other artificial restrictions, should be removed, and I think this committee should reaffirm and make clear that network organizations are subject to antimonopoly laws just as other American businesses are.

Mr. Cox. Mr. Raibourn, are you familiar with the testimony offered recently by Mr. Richard A. Moore, of Los Angeles?

Mr. Raibourn. Mr. Moore sent me a copy.

Mr. Cox. Have you read it?

Mr. Raibourn. Yes.

Mr. Cox. I take it then, that this is in partial agreement with the conclusions he draws as to the factor of option time and desirable policy with respect to restrictions on that?

Mr. Raibourn. It is a partial agreement with his point of view. I am president of the station next door to his, and I have a great many of the problems.

Mr. Cox. You compete with him and with the 3 network-owned-and-operated stations there, as well as the other 2 independents?

Mr. Raibourn. That is correct.

In this connection, I oppose the licensing of networks for the simple reason that this might provide further insulation from competition and give them possible immunity to continue the present restraints which, in my judgment, must and should be removed if subscription television has a fair opportunity to develop as a genuine force in this industry.

For some time I have been at a loss to understand the attitude of my associates in the NARTB in opposing these new and intriguing opportunities for its television broadcast constituents. This organization, of which I have been a director, to my mind is not representing the best interests of the stations or the public. In spite of the many fine things which broadcasters and network organizations have done and are doing, this industry, in my judgment, will not attain its full potential and the statutory status of which it is capable so long as 2 or 3 organizations dominate and control the vast majority of television stations and the substantial part of the program content which is broadcast by these stations.

Further, I believe it would be a salutary project if this committee, in cooperation with the Federal Communications Commission, would take appropriate measures to require the American Telephone & Telegraph Co. to expand and improve interconnection transmission facilities and offer them to all seeking their use at tariffs which are reasonable and nondiscriminatory. If the American people are investing $30 billion, our great common-carrier system should be persuaded that it has a duty to organize its service so that the maximum use can be made by the public of their tremendous investment in receiving sets, and that facilities are available to all at any time who want access to these sets, anywhere in the Nation.

Senator POTTER. How is A. T. & T. discriminatory at the present time?

Mr. RAIBOURN. The rate structure is not based on individual broadcasts. The rate structure is based on the renting of services by the networks who can furnish programs over a period of time.

Senator POTTER. In other words, the networks get lower rates?

Mr. RAIBOURN. They automatically do through the fact they use the service so much.

Now, this paragraph probably should be modified today on the basis of some of the developments that were shown in Chicago last week, and I am referring to the use of the magnetic tape. For the first time it was possible to use magnetic tape.

Senator POTTER. Is that a reality now?

Mr. RAIBOURN. Yes, it is a reality now. The reality was best demonstrated by 78 orders for magnetic-tape recorders in Chicago last week. That is going to change this situation with respect to the telephone company to some extent. I am not prepared to say how much, and I don't suppose anybody else is, either.

Senator POTTER. And that should be a real challenge to the networks, shouldn't it?

Mr. RAIBOURN. It is a great help to the networks.

Senator POTTER. It should be a great challenge to the networks, because the independents now should be able to secure good programing.

Mr. RAIBOURN. In a much easier way.

Mr. COX. To the extent, though, that you would propose to provide sports you would still need live broadcasting which would require the facilities of A. T. & T.?

Mr. RAIBOURN. That is right.

Mr. COX. Isn't it true that in order to continue the usage of those facilities, it requires high-load usage in order to support them?

Mr. RAIBOURN. That is the way the rate structure has been set up.

The point I am making here is I question whether that is the best rate structure for the growth of television in the future, and also from the standpoint of the producers and the public.

Mr. Cox. You are proposing a limited amount of subscription programing?

Mr. RAIBOURN. I think there can only be a limited amount of subscription programing.

Mr. Cox. And to the extent it is limited you would not be able to feed into the telephone facilities programs on a sufficient volume to make their maintenance of these circuits economical?

Mr. RAIBOURN. I question whether that is something which actually exists, or something that exists in the rate structure.

Mr. Cox. Isn't there a limitation upon the number of circuits actually available as presently constructed?

Mr. RAIBOURN. There is.

Mr. Cox. Which would place you in competition with the existing networks for circuits in the event you wished to broadcast a program at a particular time?

Mr. RAIBOURN. There is.

Mr. Cox. Are there enough circuits so that you could have a circuit in addition to those occupied by the existing three television networks?

Mr. RAIBOURN. Not without a great deal of planning.

Now there is a lot of material remaining in this document. I can go ahead and read excerpts of it.

Senator BIBLE. You develop it in your own way, Mr. Raibourn, because the chairman certainly hasn't any disposition to cut you short on what you want to say.

Mr. RAIBOURN. The most important point, I think, that remains in this situation is the fact that here we have such an enormous present investment by the public in television receivers, we have a potential investment of approximately double that to convert to color, and the public may or may not have access to a great number of programs which otherwise it could have access to. Now when we look at these figures, if we take the total number of motion pictures that are produced in Hollywood at the present time, if we take the legitimate shows, the opera, the important sports events of the country—baseball, professional football, in fact all of them—and add them together and find out how much time they take up in a year, you reach a total of less than 2,000 hours.

Now in New York City we have seven stations on the air competing for the attention of the public. Those 7 stations are producing between 30,000 and 35,000 hours of entertainment a year; so at least in New York the possibility of subscription television removing from the public the access it has, through these stations, to sponsored and sustaining programs just does not exist. Your problem would be a little more acute in Washington because you haven't got 35,000 hours in Washington. But in my judgment from 35 years in show business I do not believe that you can get the public to pay for more than 1,500 or 2,000 hours of the material that is now available.

Senator POTTER. How much would the public pay per show?

Mr. RAIBOURN. The public pays per show in proportion to their desire to see the show. We at Telemeter figured at first that a dollar limit might be a fair limit.

Senator POTTER. Is that an hour, or per show?

Mr. RAIBOURN. Per show. When considering that for a show, you are considering a show that would last an hour and a half to 2 hours. We finally set the upper limit at $2, based on the inflationary movement up of admission prices to various events in the country. That is guesswork. I still must say that we have an aphorism in the show business—"The public is always right." They determine finally what you do and what you can do. Now if you start looking at this situation in terms of money, the amount of money that is taken in as film rentals for motion pictures in this country—that is not admissions to the box office, that is the amount they pay for the shows themselves—is in the neighborhood of $400 million a year. If you add to that the approximately 50 or 60 million dollars that is paid for legitimate shows, the $30 million for professional baseball, the $30 million for professional football, and then try to pick out a number of entertainments which could be added to that, you probably can get up to a figure of about $600 million a year that is paid for those things at the present time. When you compare that with the amount of money that the public is investing in television—that they have invested—they probably have invested $15 billion between their sets, their antennas, the service that they had to get them to work right—and it is probably going to be 1½ to 2 times that for color—I have to say to myself, I don't understand the amount of objection to the injection of this small area into this situation when it is going to add to the public's enjoyment.

Senator POTTER. What would be the mechanics involved assuming you wanted to broadcast the Washington Senators baseball game? Would the baseball company put on—would they receive the entire revenue?

Mr. RAIBOURN. The revenue would go to the broadcasting station. They would buy the time. There would have to be a service charge paid for the collection of the money, for all of the problems that will go in connection with this situation. We have discussed a great many ways of organizing this business, to get people interested in it. Our problem at the present time would be to get people interested and make them invest in it and get it started.

Senator POTTER. What has been the reaction of your sports promoters?

Mr. RAIBOURN. Can I introduce Mr. Paul MacNamara, who has spent a great deal of time on that?

Mr. MACNAMARA. The management of baseball are all for some sort of pay-as-you-see television because the baseball business, as a business, in America is being crippled with television. Twenty-two leagues did not start this year—were put out of business. Last year in Houston, Tex., at the minor league meeting, we went down there with a plan because it is that critical that they are looking for ways and means. I am getting to the answer to your question. But the background, I think, is important. Our plan for Cleveland, for instance, was that the minor leagues that come under the umbrella of telecasts originating in Cleveland—for instance, Cleveland is playing the Yankees and that game is going out over parts of Ohio where minor league baseball games are playing the same day. Very few people want to see Sandusky play when they can look at Mickey Mantle, so nobody shows up at the baseball park and the minor league goes out of business.

Now with the telemeter plan of metering, if the telecast of the Cleveland game was going out under the same umbrella method and you, as a fan in Sandusky living in the area of the baseball franchise for Sandusky, tuned into the Cleveland game and put in a quarter to see the game, some part of that quarter would stay in Sandusky and go to the owners of the Sandusky franchise, just as the Sandusky franchise holder for Coca-Cola would object if a red truck came up from Cleveland into that franchise area to sell Coca-Cola—but that is what is happening with the telecasting of baseball with minor league baseball.

But the question was, this would be very good for minor league baseball but how would Cleveland feel about it? So we suggested—Mr. Trautman, who is president, suggested that we meet with members of the National League and the American League to ask the question. They are supplying the entertainment for Sandusky in this case, but they also are well aware of the importance for baseball of the continuing existence of minor league baseball. The whole idea of baseball has to exist with a base of minor league baseball and at the present time it is getting knocked off.

For instance—and this illustration was given, in the Chicago meeting—Albany is playing New Haven in the Eastern League, late September night. This is the final game—if they win this game, they win the pennant, the flag in their race. I think the field in Albany seats 10,000 people. It is going to be played under lights, in perfect weather conditions. The same night in New York the Giants are playing the Dodgers and it is telecast. How many people paid to see this game, the final game? There were 34 paid admissions.

Now you go down to see Mr. O'Malley or Mr. Topping, the management people, and they are favorable toward it for another reason. If they can reduce the number of people that are getting it for nothing, they have a greater chance of selling it, and they are after all in the business of manufacturing a product like anyone else. They are manufacturing baseball entertainment and yet they are giving it away.

Now the advertiser, on the other hand, is getting very close to saturation as to what he can pay for these games. Well, if he is unable to pay any more, and what he is able to pay does not make up for the difference of the loss at the box office, then you have a problem where I don't think it will be too far in the distant future that baseball will be going off the air. It is beginning to go off the air a little now in certain situations in the United States.

The Hollywood Stars aren't telecasting their games this year. Cleveland has cut the number of games. So while the public may want it, and feel that they are entitled to it because they bought a set, there was nothing in the contract when they bought the set that said the Hollywood Stars have to go out of business, and I think that is a part of the economics of sports where pay-as-you-see television can make a contribution to keep it on the air for the public to see it.

Senator POTTER. Of course, I assume you could follow that to a conclusion that eventually they may be playing before empty stands.

Mr. MACNAMARA. No, on the other hand, they would be playing before more people because now let's say there are 3 million sets in New York, and whatever the rating might be might give them a million free admissions now. So with a million people seeing it—some of them interested, some of them very interested, and some of them only faintly interested—the people who were very interested might be willing to pay a quarter, although some of them would say "Well, if I have to pay money I am going up to the stadium," so we would reduce probably the number of people that would see the telecast, but we might increase the admission at the gate.

Mr. Cox. You feel, then, that in this instance the imposition of a charge for seeing something that is now, at least to some degree, available free is necessary in order to preserve the very medium that the people are enjoying.

Mr. MacNamara. I do not think there is any question about it, and I think if you talk to the heads of baseball who are very familiar with the economics of the thing, they will make the point real strong that they are getting killed.

Brooklyn won the pennant and is now playing 8 games or 6 games in Jersey City. You cannot do any better than win the pennant.

Senator Potter. It is going to be a great drain, though, on a husband who has a baseball fan as a wife home in the afternoon and these games are televised and she pays for them. It is going to be hard on the family budget. [Laughter.]

Mr. MacNamara. Well, maybe they will go to see the game. I do not think that the drain on the budget will be as bad a blow to the baseball fan as the elimination of baseball from television.

Senator Bible. What charge do you propose for seeing the New York Yankees and the Cleveland Indians play on a Sunday afternoon in Sandusky?

Mr. MacNamara. I think that will be determined by the number of seats available, but I would guess at somewhere from 25 to 50 cents.

Senator Bible. You may proceed.

Mr. Raibourn. I think I can conclude everything I have to say and leave the rest for the record with two statements: One based on a study made by the Columbia Broadcasting System and reported to the Federal Communications Commission, which is described at some length in here, in which they say they think a maximum of 585 stations is the maximum possibility in this country at the present time, under the present broadcasting setup. That, of course, is not what the Federal Communications Commission envisaged, nor what I think the people who dream of what television can do have envisaged. We have dreamed of television being something for the small town as well as the large city.

Subscription television is just another way of adding to the income and adding it in proportion to the desirability of the programs to the smaller groups of people.

Senator Bible. Mr. Raibourn, what type of specialized programs do you mention in your presentation? I notice, in running through it, you mention opera and stage presentations.

Mr. Raibourn. Sports.

Senator Bible. New movies?

Mr. Raibourn. Yes.

Mr. Cox. Education?

Mr. Raibourn. Education. To that one point I would just like to add the further point that I think the people who will benefit greatly by this are the broadcasters. They become a more general medium of reaching the public and in becoming a more general medium they have the possibility of higher revenue and more demand for their facilities.

Senator POTTER. What effect would this have on a neighborhood theater?

Mr. RAIBOURN. I think it would be very difficult for the neighborhood theater, but I think television is making it difficult for a great many neighborhood theaters now—especially those that play the secondary types of pictures.

Mr. COX. You suggested a while ago that in broadcasting a baseball game, quite possibly the baseball management might buy the time. Now if it was handled in that way so that the broadcaster can receive no more than his class A time charge, or whatever time charge is applicable at that time of the day, what incentive is there to him to disrupt his present arrangements and to broadcast this rather than a national spot program on which he can derive exactly the same revenue, with perhaps less difficulties?

Mr. RAIBOURN. Well, if he can derive the same revenue, there perhaps is no incentive. I think that any increased demand for his facilities is bound to allow him to make a larger charge for his time.

Mr. COX. If it is a better program he may get a better rating for it?

Mr. RAIBOURN. Yes.

Mr. COX. The point I am making is do you propose that the broadcaster will share in the revenue from the subscription program, in any way other than the present time charges?

Mr. RAIBOURN. I think you are going to have an adjustment here, and I cannot tell you exactly how it is going to be made. To the extent that the broadcaster is an entrepreneur himself and willing to invest his money to speculate on what the results will be, to that extent he should share in it. If he is unwilling to do that and merely wants to sit there and sell his time, he should not share.

Mr. COX. In other words, he has the option to reverse it. He can go to the baseball club and buy the game?

Mr. RAIBOURN. That is right.

Mr. COX. And then exact whatever is a fair share, over and above the administrative costs, out of the revenue that is derived?

Mr. RAIBOURN. That is correct.

Senator BIBLE. Mr. Raibourn, I think Mr. Landis developed the fact that—take the converter-decoder that he was testifying about—that it would cost the individual user something in the neighborhood of $45 per set. Now to take advantage of your device—does it have a specific name? You probably have developed it in the testimony.

Mr. RAIBOURN. The telemeter.

Senator BIBLE. How much would it cost the user to buy the telemeter?

Mr. RAIBOURN. Let me tell you where we stand on that question. We have made a great deal of studies. We conducted an extensive test in Palm Springs, Calif., over the wire, on this situation. This is our conclusion. That at $25 these would move like hot cakes. At $100 they would move with great difficulty. We expect to be able to sell our device, installed in the home, at somewhere between $30 and $50.

Senator POTTER. Is yours the type where you can pick up a telephone and call a certain number——

Mr. RAIBOURN. No; we are the ones that have the coin box where you put the money in.

Senator POTTER. The coin box?

Mr. RAIBOURN. Yes; we have great enthusiasm for that approach since we have always had great difficulty in the amusement business collecting for amusement after a person has had it.

Senator BIBLE. I think that is true not only of the amusement world. Let me develop that a little more thoroughly, though. I pay $30 to $50 for this telemeter that I put on my set. Now do you have any general estimate of what it would cost me per week? I notice you say here that you made the survey at Palm Springs, and I think that might be helpful. The thing I am interested in is after I have invested $50 in this telemeter, how much does it cost me to see what type of programs? Have you developed anything along that line?

Mr. RAIBOURN. We think most programs that would be an hour to 2 hours long would probably sell under $1. We expect, on the basis of what experience we have had and the study of the Zenith results in Chicago, for the amount that is paid per home to run in the neighborhood of $4 to $10 a month.

Senator BIBLE. That would be $4 to $10 a month, and that would entitle me to see how many hours of subscription television?

Mr. RAIBOURN. We would expect that that would probably entitle you to see on an average of about 20 hours.

Senator BIBLE. You believe that the maximum at this stage would be about 40 hours a week. Does that seem to be a fair figure?

Mr. RAIBOURN. I don't think you could find more programs that you could charge for than that amount.

Senator BIBLE. That would be the maximum?

Mr. RAIBOURN. Yes; that would be the maximum available to people. The use they would make of it would be somewhat less.

Senator POTTER. Then you would have people go round and collect from the coin box, and so forth?

Mr. RAIBOURN. Well, there are several ways this can be done. The coins finally fall into a small drawer-type of device which has a decoding mechanism connected with it, and that can be slipped in and out. You have two ways of moving, then. You can have somebody go around and collect them, or you can have a central station at a drug store, for example, where you put one in and get another one out.

Senator POTTER. Don't you think American ingenuity could devise a slug for that coin box pretty well?

Mr. RAIBOURN. I suspect so. But I think we are up against the same problem the telephone company is. When they find too many slugs in a pay station they take it out.

(Discussion off the record.)

Mr. COX. If you are going to sell the telemeter to a man, how can you ta'-e it out of his home?

Mr. RAIBOURN. We don't remove the telemeter. It is just a little drawer.

Mr. COX. But you substantially destroy the value. If you are going to stop it because he has put in too many slugs, you are going to leave him with a $30 investment.

Mr. RAIBOURN. Don't you think if he puts in too many slugs, we are entitled to do that?

Mr. COX. You could always demand that he substitute a nickel for a slug at that point, but you might have some trouble with him.

You mentioned the use of films and stage plays. Isn't it true that there is a fairly substantial portion of the entertainment made available in those forms which would not be suitable for use on television because you are taking it out of a restricted location and putting it into a living room at home, where it would be exposed to people who don't ordinarily go to a movie or a play?

Mr. RAIBOURN. Well, money enters into the question. You have a different type of supervision from what you have in the free sets. In free sets that you have in the home now, the parental supervision is sometimes a little difficult to exercise. There is a great deal of discussion in the television field at the present time as to how much of that is the broadcaster's responsibility and how much of it is the parents' responsibility.

Mr. COX. The point I have in mind is that if you broadcast a first-run movie at 7 o'clock at night, or 7:30, when the younger members of the family are still up, you may run into the problem that either it is paid for and is received and is found not to be suitable for all members of the family, or they simply bypass the product because they anticipate that it is not what they want for their children.

Mr. RAIBOURN. I have helped write both codes, and I am perfectly familiar with them, and they are not too different.

Mr. COX. You think that a movie which passes the code in Hollywood would satisfy the requirements of the NARTB?

Mr. RAIBOURN. I think most of them would.

Mr. COX. And you think it would be something that the public would be happy to have in the living room?

Mr. RAIBOURN. I think it would be something the public would like. We try to keep our motion pictures of that type.

Mr. COX. I take it, though, that there are certain themes——

Mr. RAIBOURN. And the most successful ones are that type.

Mr. COX. There are certain themes which can be treated on Broadway which would not be home entertainment.

Mr. RAIBOURN. I think that is quite true.

Mr. COX. You do not, as Mr. Landis did, suggest a limitation of availability of subscription programing to UHF stations; do you?

Mr. RAIBOURN. No; I do not. I am very disappointed as a broadcaster in the failure of the UHF stations to develop in the way that I hoped they would. We have a very difficult problem in this situation, and to some extent I must place the responsibility on the failure of the Federal Communications Commission to authorize UHF fast enough. You see, what happended was this: The lower channels were authorized, and they developed so fast while the Communications Commission was studying the problem of what to do about the additional channels that too many sets were in use by the time the authorizations were made.

Now, we are going to have a change in the sets in this country. That is going to arise with color. I hesitate even to suggest anything with respect to this, but certainly some thought should be given to the question of whether those new sets should not be available to both groups of stations.

Mr. COX. I take it, then, you don't contend that this is going to be of any substantial assistance to UHF other than in providing it, perhaps, with a type of programing which will attract people to convert so they can receive the U signals?

Mr. RAIBOURN. Yes; and the only assistance that UHF needs is two things. It needs money to live on, and that money only arises when there are sets that are available.

Mr. COX. Don't you face the problem that the subscription programer, when he goes into the market, is going to have the same desire as the advertiser to reach the maximum possible number of sets, and that if there is a low conversion rates he is going to try to make arrangements to broadcast his program on the VHF station?

Mr. RAIBOURN. I think that is entirely true.

Mr. COX. Then to the extent you broadcast programs on VHF stations you run into the point raised by Senator Potter. At that time, like Skiatron, you are displacing a program that otherwise would have been there free of charge?

Mr. RAIBOURN. That maybe can go over onto the UHF station.

Mr. COX. Well, presumably it hasn't been attractive to the subscription programer, so it may not be attractive to anyone.

Mr. RAIBOURN. Well, I think it is the responsibility of everyone in the television business—and I must include this committee and the Federal Communications Commission in it—to try to make those channels useful and available, because I don't see otherwise how a goal of a national system of television in which a smaller community has a chance to express itself can be realized.

Mr. COX. Now, do you have any proposed policy as to entrance into particular types of markets? Would you propose to undertake to provide subscription service in a 2- to 3-station market?

Mr. RAIBOURN. I certainly think it ought to be made available everywhere. I don't think it is going to develop that fast, and I think it will move into limited markets at the start.

Gentlemen, may I add something to this situation? I am not one of those who believes that subscription television could be put into existence tomorrow. There are too many interests involved. I think it is necessary for the Federal Communications Commission to make quite a study of this matter and to allow a great many people to be heard on this matter, including the manufacturers of sets who have not been heard as yet.

But prior to the time they do that it is necessary for them to say that subscription television fits into the present system of broadcasting, or some system of broadcasting which they devise, so that the whole industry can move together in setting up this situation and making it possible for the American public to have these advantages.

Now, until that is done—and we have not got over that point yet, that is the point at which discussion centers at the present minute—until that decision is made that this does fit in, and that studies are going to be made as to how to make it practical, from then on there is going to be a lot of people heard, and these problems of just how this is to be developed become the paramount ones at that moment.

The real hurdle now is the decision that this should be a part of the American broadcasting system.

Mr. COX. If you propose to go into a 2- or 3-station market, and it is of a substantial size, I assume that these stations have affiliations with the networks, so that you would require, actually, the suggestion you made a while ago of elimination or limiting option time in order to be able to get prime time in those markets?

Mr. RAIBOURN. That is right.

Mr. COX. Now, to the extent that you do into a two-station market and get prime time in the evening on one, we will say, of the stations, you have, during the period that program is being offered, reduced the choice of the viewing audience in this way: They still have 2 choices, as they had before, but 1 of them is available free of direct charge and the other requires the payment of 25 to 50 cents to a dollar?

Mr. RAIBOURN. That is correct.

Mr. COX. So that if there exists any substantial portion of the television- set-owning population who do not feel that they can bear this additional burden, you will have cut their choice in half by force of economics?

Mr. RAIBOURN. Yes.

Senator POTTER. Of course, it could go further. If this were carried out there is no reason for not having 2 subscription television broadcasts at the same time in a 2-station market.

Mr. RAIBOURN. I think it would be very possible for the Federal Communications Commission to put restrictions on the amount of this. I think the total restriction that exists because of the economics of the situation is one that is going to work pretty favorably to sponsored television, anyway. But you have this situation now which is one of the things that is causing the development of the community antenna situation around the country. There are a great many programs available from the networks which never reach communities unless somebody is willing to bring them in from some other source other than the stations, and in going around the country you find, amazingly, that there are certain programs which don't reach certain areas to any extent hardly at all.

Senator POTTER. You think the Commission should restrict it if the Commission should concur in allowing subscription television to develop?

Mr. RAIBOURN. I think it is a very possible thing for the Commission to do. I think they should study the matter before they make a decision with respect to it.

Mr. COX. Do you think that there is any possibility that, in order to supplement the available sources of programing that you have referred to, subscription programers will try to draw on the existing television talent and try to create for them new programs of a general entertainment character which they could offer?

Mr. RAIBOURN. That is the growth of entertainment, anyway. You start with a subject matter, or a talent which is comparatively unknown, and you build them up from there. Certainly, the motion picture is growing on television. Television is growing on the motion picture, and that process is still going to continue. That is utterly independent of what kind of systems you have.

Mr. COX. The point I have in mind is that in order to supplement movies, Broadway shows, sports, you might eventually create productions which are put on in a studio as networks presently do, using talent, stars, who are now on television, and compete with the networks with that kind of programing as well?

Mr. RAIBOURN. Absolutely. I don't think we are going to exclude Bob Hope from any one of these sets of facilities.

Senator POTTER. It is going to be rough on politicians, though, on subscription television. [Laughter.]

Mr. Cox. Don't you think they will pay to see you, Senator?

Senator POTTER. Maybe the Republican and Democratic hundred-dollar dinners could be converted to subscription TV.

Mr. RAIBOURN. That is something that has been mentioned that might appeal to the politician.

Mr. Cox. How do you propose to provide public-interest programs to the public through the subcription medium—that is, matters that are not entertainment in the sense that people are accustomed to paying for them, but things which are obviously of interest to them such as discussion of public issues? Would you try to provide that sort of feature?

Mr. RAIBOURN. Oh, certainly. I have received a great many letters on this subject since I started talking about it some years ago, and I find that there are quite a few people in the country who feel they would like to determine what they see on television. A great many of them have ideas about programs which are essentially of the character of being informative to them, to know what is going on, but which may not be of sufficiently wide interest to have them get on sponsored television, and those now are usually furnished by the networks on a sustaining basis.

Mr. Cox. You would have to make a charge for this, though?

Mr. RAIBOURN. Yes; you would have to make a charge if you furnished this. We still don't have any penny slots in the telemeter, but we do have nickel slots and dimes and quarters, and I think there would be quite a field for that kind of thing for people who were interested in that kind of matter.

Mr. Cox. Then suppose the President makes a report on the state of the Nation. Are you going to furnish that, or provide a facility for furnishing that, which is in any way comparable to that which is furnished by the present networks; and, if so, are you going to make a charge for it?

Mr. RAIBOURN. I don't think any one of us wants to charge for the President's speeches.

Mr. Cox. Well, are you going to provide them?

Mr. RAIBOURN. What do you mean by that? Are you expressing the idea that I think this will drive the present networks out of business, and we will have an entirely different structure? I don't believe that.

Mr. Cox. No; I am asking, though, that to the extent that you create a programing source which to some extent, at least, is going to feed these programs over the existing cable facilities, so that you in effect are operating a network—whether in that connection you propose to provide this wide range of programing now available, from the completely commercial to the completely sustaining, to the stations which have entered into arrangements with you; or do you think that they will take from you for pay and then turn to the network for a free sustaining program?

Mr. RAIBOURN. I think they will do both, and I suspect that the programs will be provided by the organizations which are engaged in subscription television and will be sustaining in character, and I am not so sure they might not use them to advertise their products.

They are going to have to advertise their products over the air, too, to get people to pay for them.

Mr. Cox. Do you propose to furnish this educational programing that you talk about on noncommercial stations only, or do you think that such educational programing could be made attractive for commercial stations and appealing to particular audiences?

Mr. Raibourn. I think it can be made attractive for commercial stations.

Mr. Cox. I assume that you are asking the Federal Communications Commission for a change in its rules to permit an educational station to make some charge for these programs, since, as I understand it, they would be in violation of their present regulations?

Mr. Raibourn. I think that is in our request. Our request is quite a long involved document.

Senator Bible. Senator Potter?

Senator Potter. I have no more.

Senator Bible. Thank you very much, Mr. Raibourn. We appreciate your testimony. I think it has been helpful to the committee.

Mr. Porter. Mr. Chairman, can Mr. Raibourn's statement be incorporated in the record as though read?

Senator Bible. Yes; that was my earlier order. It will be incorporated in the record as though read.

(The balance of Mr. Raibourn's statement is as follows:)

At first blush, it might appear anomalous for me to be here discussing subscription television in a hearing which is devoted primarily to the UHF problem and questions of network monopoly. But when I have concluded, I am confident that you will agree with me that subscription television is very relevant to the subject matter of your deliberations. For subscription television promises to make available new sources of programs and revenues, and, what is more, UHF stations will be on an equal footing with VHF stations in being able to earn the revenues which these new programs will make possible.

Moreover, the new programs thus made available will come from a myriad of sources which will mean a restoration of independence to the station operators. For when station owners can bargain with a score or more of sources for programs, they are beholden to no one source. The television broadcast field today is dominated by the networks because under our present system 2 or 3 networks are the principal sources of popular programs. The stations must stay on good terms with the networks and do their bidding or else they find themselves without network programs.

But I am a little ahead of my story. Let me start at the beginning by discussing some of the basic economic facts of television broadcasting.

Television broadcasting as we know it today is supported solely by advertising revenues. Business concerns use television for advertising because it is the most effective medium thus far developed for promoting the sale of products and services. Advertising expenditures, of course, represent only one item in the overall expense of doing business. These expenditures are deemed justified by business concerns only if they produce results. And it is axiomatic that results cannot be produced unless people are watching the program, for people who do not watch cannot be influenced by the advertising message and thus cannot be persuaded to buy the sponsor's product.

A study of current data on this subject is revealing as is shown by the following tables:

TABLE 1.—*Average cost per home tuned in per telecast for 59 sample 1954 programs (adjusted for half-hour basis)*

Cost per set: Less than—	*Number of programs*
1 cent	20
1½ cents	43
2 cents	50
2½ cents	55
3 cents	55
3½ cents	56
4 cents	57
4½ cents	58
5 cents	58
5½ cents	58
6 cents	59

Observe that 43 out of the 59 programs had an expenditures of less than 1½ cents per home tuned in for each half hour. This figure is for a wide cross section of television programs, some of which had large audiences and some of which had relatively small audiences. If we consider the top-rated programs, the figures per set tuned in drop sharply as the following table shows:

TABLE 2.—*Cost per TV home tuned in per telecast for top rated programs* [1]

Program	Cost per telecast	Number of homes tuned in	Cost per home reached adjusted to half hour
HALF-HOUR PROGRAMS			*Cents*
I Love Lucy	$88,600	17,892,000	0.5
Dragnet	78,077	14,658,000	.5
You Bet Your Life	80,562	14,468,000	.6
Jack Benny	95,110	14,399,000	.7
ONE-HOUR PROGRAMS			
Jackie Gleason	130,789	16,986,000	.4
Toast of the Town	115,615	16,130,000	.7
Disneyland	146,144	15,772,000	.45
Bob Hope	141,735	14,398,000	.5
Buick Berle Show	162,040	13,892,000	.6

[1] Covers the 9 top-rated shows for 2-week period ending Mar. 12, 1955. Peter Pan, the top-rated show, is excluded because it was a 1-time performance.

For the most popular programs, the cost per set tuned in, on a half-hour basis, is one-half cent. We thus have a range from a low of 0.4 cent per set tuned in to approximately 6 cents, with the greater majority falling in the category below 1½ cents per home tuned in.

These figures teach us two things: First, advertisers can afford to sponsor only programs which appeal to the largest possible audience. Shows which have limited audience appeal are unattractive to the advertiser, since the cost per set tuned in becomes prohibitively high. Second, the expenditure per home tuned in is abnormally low when judged by entertainment-expenditure standards. Multiply the 1½ cent figure by 3 to cover the average running time of a movie, 90 minutes, we arrive at an expenditure of 4½ cents for 90 minutes' entertainment. This compares with the 50-cent admission figure for most neighborhood theaters.

What lesson do these figures teach us? First, so long as advertising revenues are the sole support of television operations, commercial programs of necessity must be geared to the mass audiences. The advertiser can afford to present programs which appeal to the lowest common denominator of the mass audience, and which eschew any controversial topics which might offend the sensibilities of any portion of the audience. For wounded sensibilities mean not only a loss of audience, but what is more important to the sponsor, a transfer of irritation to the sponsor and his wares. The advertiser, as a matter of business economics, cannot afford to risk a program or a scene in a program which may irritate even a small portion of the audience, thus repelling rather than attracting customers. He has no choice, therefore, but to play it safe.

Each program must be carefully scrutinized to make sure that it will appeal to all people and that nothing in it will be considered controversial by any group. If there be a doubt, the doubt must be resolved in favor of exclusion rather than inclusion. This may be a fine dictum for the sponsor. It means an impossible obstacle to truly mature and artistic creativity.

The problem of presenting quality programs on television is complicated by the fact that almost all of the top TV network advertisers sell a variety of products—some appeal to men, some to women, and some to children. In this area of merchandising the product name is more important than the manufacturer's name. A variety of programs are required to push a variety of products. Thus, to sell Supersuds to women, Colgate chooses a daytime program, while a nighttime vehicle is used to encourage men to use Palmolive shaving cream. Similarly Gillette sells razor blades with the boxing matches at night, and Toni permanent waves in the daytime.

A great deal of this type of advertising depends upon repeated impressions for effectiveness. Thus, rather than splurge upon a high-budget, mass-appeal production, the advertiser will turn to a series of low-cost daytime soap operas where repetition of the sales message is more effective than a single high-cost promotion. For example, in 1954 Procter & Gamble ran 22 programs, including such fare as Welcome Travelers, The Seeking Heart and Three Steps to Heaven. Out of $31 million total TV network advertising expenditures by Procter & Gamble in 1954, about $23 million went for daytime programs, and about $8 million for nighttime programs. This pattern was repeated by other advertisers with the same sales objectives.

The second effect of television being dependent solely upon advertising revenues, is that educational programs, artistic programs, opera, good music, and other programs of high cultural value can get an airing only on a sustaining basis. The availability of such programs depends upon the willingness and ability of stations to present these programs on a sustaining basis. The station operator must not only be willing to forego commercial revenue in order to carry these sustaining programs, but in addition he must be willing and able to pay some of the expenses involved in presenting the programs—expenses which are borne by the sponsor in the case of commercial programs.

Moreover, the availability of such programs depends upon the existence of opera companies, symphony orchestras, repertory theaters, and so forth. Even in the largest cities these nonprofit organizations have great difficulties in supporting themselves. With television grounded upon advertiser support only, no vehicle exists for enabling the large television audience to contribute to the support of these nonprofit organizations. The advertisers cannot underwrite these programs, because their appeal is not broad enough on a cost per home basis to justify the expenditures. The viewer cannot help, because there is no means to elicit that help.

A third consequence is that the viewer is in no position to improve his lot. In the nonbroadcast world, if his tastes are not satisfied by the movie in the neighborhood theater, he can, by paying more money, go to an art theater, the legitimate theater, opera, concert, and so forth. His choice is bounded only by his taste and his pocketbook. In television he has no such choice. No matter what his taste; no matter what he is willing to pay; he can receive only what the advertiser can afford to bring him; he must accept the type of entertainment which can be bought for 1½ cents per half hour per home and which is acceptable to the mass audience.

The opponents of pay TV argue that the public gets what it wants on sponsored television. I agree that the public gets many fine programs on television and I want the public to continue receiving those programs. However, there are many fine high-caliber programs which sponsored television cannot possibly afford to bring in television. What we seek is simply to give the public an opportunity to indicate whether they desire to have such programs by paying for them. We do not seek a monopoly. We are happy to compete with sponsored television for audience, with the full knowledge that our entry in the field will spur sponsored television to produce better and better programs so that the audience will stay tuned to sponsored programs rather than tuned to a program for which a charge will be made. In turn, this competition will spur us on to produce distinctive programs for which the public will be happy to pay. Obviously, the public will not pay for a program if equal or superior fare is available without charge on a sponsored program. The competition between the two types of television will benefit the public.

The point has been made that pay television probably will dominate and drive out sponsored television. For two reasons I doubt that such a development is possible. The first one is that in New York City, for example, there are approximately 35,000 hours per year of free television.

The total of all of the programs, which, it seems to me, the public might be charged for should not exceed more than 2,000 hours per year at a maximum. Secondly, it should be remembered that the gross film rentals paid to producers in the United States is only about $400 million per year. This $400 million, with the revenues from admissions for legitimate theater, baseball, football, and boxing, probably do not exceed $600 million per year. Thus, there are certain economic limitations on the product available for pay television. It should be emphasized that these revenues appear relatively small compared with the public investment, particularly when it is considered that receiving sets become obsolete or must be replaced every 5 years or so.

Thus far, I have discussed in general terms the type of programs which pay TV can make available to the public on a regular basis. Let me now be more specific.

NEW MOVIES

Among the most important types of entertainment which could become available at home to the TV public if the financial base of TV broadcasting is broadened through pay TV are current motion pictures of high quality. Just a word as to why these are not now available—except on an irregular basis.

The Motion Picture and TV Almanac estimates the average cost per feature film in 1953 at about $900,000. In fact, the cost range varies widely—roughly from a minimum of $300,000 per picture to a maximum in excess of $6 million per picture. When television-station time charges are added the cost in increased by another $100,000. Assuming the $900,000 average cost plus $100,000 time charges, the total cost to the advertiser under sponsored TV would be about $1 million—a cost nearly 3 times the cost of the single most expensive TV show in 1954—Producers Showcase.

For a single firm to undertake to bring to the public 52 current average cost movies per year at the rate of 1 per week would involve an expenditure exceeding the combined TV expenditure in 1954 of the 2 largest TV advertisers, Colgate and Proctor & Gamble, who, in 1954, presented 31 different and separate programs conveying their sales messages many times weekly. The impracticality of presenting current motion pictures by sponsored TV is obvious. But what would happen under pay-as-you-see television?

From data collected by Telemeter it is estimated that average feature films could be presented on pay TV at a price range, depending on the number of sets tuned in, of 25 to 40 cents; good class A features at a price range of 30 to 60 cents; and exceptionally expensive films at a price of 55 cents to $1.20. With these price ranges, based upon the number of sets tuned in varying from 10 to 25 million, pay TV could produce the $2 million required to meet the producers' and distributors' costs for an average feature, the $4 million required for a good class A feature and the $10 million required for the exceptional film—costs that are obviously prohibitive under today's system of advertiser-sponsored television.

I can almost hear the proponents of status quo ask, "But what about Richard III? Did not this magnificent spectacle appear on sponsored television?" Of course, it did, and a well-deserved tribute to the television industry for this noteworthy event. My answer, however, to Richard III is that it is a noteworthy event not only because of the quality of the program but also because it is exceptional. Sponsored television can afford this kind of luxury only at rare intervals.

In pay TV, high quality feature films will be a regular occurrence. My company is willing to invest substantial sums of money in bringing such programs to the television audience willing to pay for them. Our decision is based upon our opinion that sponsored television is not set up to do the job. If we are wrong—if sponsored television is able to bring pictures like Richard III to the public on a regular basis—obviously we are going to lose a lot of money. We are willing to take that risk. If we are right, the public will be the gainer. If we are wrong, our company will be the loser. If our management and stockholders are willing to take this risk, why should our opponents be concerned?

STAGE PRESENTATIONS

Pay TV could also bring at a reasonable cost legitimate theater and Broadway shows to a larger audience than now has the opportunity of seeing them. Relatively few people can see such presentations under present arrangements and facilities.

Typical costs for musicals—normally the most expensive types of Broadway productions—are about $250,000 and range from a low of about $200,000 to as high as $350,000; $350,000 to $500,000 may be taken as a very rough range for the cost of purchasing many Broadway presentations after a reasonable run. Total adaptation costs may run up to about $150,000. The time charges for a 2½-hour musical would normally be covered by about $200,000. Thus, the costs of putting a Broadway presentation on TV might frequently run from $700,000 to $850,000—a financial undertaking which advertisers would only rarely assume.

By comparison, pay TV would find the Broadway show an economic "shoo-in." If about 8 million sets in use, or about one-quarter of the present total number of sets in use were tuned in, these costs would amount to about 9 or 10 cents per set; if 16 million sets tuned in, they would be about 4 or 5 cents per set. With an allowance for administrative and collection charges and profits, the total price required per set for pay TV might be about 30 cents to 40 cents. This compares with an admission price range of $4 to $9 for seeing most such presentations on the stage.

OPERA

While it is difficult to gage the extent of popular interest in opera, pay TV certainly would offer an opportunity for the presentation of opera to broader audiences than at present. An estimated 70,000 people paid up to $7 per seat for the theater-telecast of the opening of the Metropolitan Opera in 1954.

During the 1953–54 season, two 1½-hour operas were telecast on Omnibus. Total program costs of these Sunday afternoon operas were $65,000 each, including costs, among others, of adaptation, staging, and a small fee to the Metropolitan Opera. Time charges for Omnibus programs are $70,000, making a total cost of about $135,000. If the operas had been telecast during the most favorable TV times, the time charges would have been about $115,000. Total time and program costs under such circumstances would have been about $180,000.

While Omnibus presented these two operas at no direct charge to the public, there has been no regular presentation of opera on sponsored TV. The number of sets tuned in on Omnibus ranges from about 2½ million to 3⅓ million. If 1 million sets were to tune in regularly on a pay TV presentation of opera, a price of only 25 to 30 cents per set would make regular presentations economically possible.

SPORTS

Pay TV could bring into millions of homes the fights and football games which are now being restricted to theater TV with limited audience. It could insure home TV against the further loss of other sporting events to theater TV. By making available an alternate source of revenue to producers of sporting events whose attendance is being hurt by sponsored TV, it could prevent many sporting events from going off TV altogether, and bring new additional sporting events to the TV screen.

Attendance at major league baseball parks in recent years has declined. Sponsored TV is generally believed to be one of the major factors behind this decline.

Minor league attendance has slumped still more and minor leagues have been steadily reduced in number since 1946. Reflecting concern with the effect of TV, the major league teams in some cases limit the number of games they will permit to be telecast while playing at home.

By providing an additional source of revenue, pay TV can strengthen the financial base of baseball and reduce the necessity of limiting TV baseball presentations that compete with the normal gate. For example, the total Washington attendance in 1954 was about 500,000, or an average of about 7,000 per game (counting doubleheaders as one game), at admission charges ranging from 75 cents to $2.50. There are approximately 650,000 TV sets in the Washington area. If the Washington club could obtain an average of 15 cents net per set tuned in, it would need to reach only about 10 to 12 percent of the total sets in the area in order to recoup from pay-as-you-see TV as much as it ordinarily takes in at the box office.

In 1953 and 1954, the Notre Dame football games were shown only on theater TV and not on home TV. They were available in only about 10 theaters. There have been agreements by college athletic authorities not to show their games in certain areas in order not to curtail the gate of other institutions. There are various local blackouts on the games that are presented on home TV, both professional and college.

The fact that most football games are of regional rather than national interest has often meant that the advertiser is not willing to pay enough to compensate for the loss of revenue at the gate. But while the interest in many football games is local it is often intense. With pay TV, substantial numbers of viewers would be willing to pay higher prices per set than the advertiser pays. This additional revenue would alter the balance between the yield from TV and the loss in gate revenues, making it possible to give the public a wider range of TV football entertainment.

Even the world series, which from the outset has been a mainstay of sponsored television, shows signs of unrest so far as home audiences are concerned. It has been economically feasible for sponsored television to underwrite the world series largely because a long-term contract fixed the cost at the extremely low figure of $1 million per year. This is the last year of that contract. All indications to date are that the cost will jump to at least $3 million per year. Television Digest for April 7, 1956, reports that Gillette—the perennial sponsor of the series—does not feel justified in underwriting this heavy cost. According to the news account:

> Gillette this week informed NBC-TV it's not interested in paying $3 million for sponsorship of world series when new contract is negotiated starting in 1957. Baseball commissioner's office, at behest of players (who will get 60 percent of world series TV receipts), reportedly is seeking $3 million per year for the

rights. NBC spokesman said it was extremely doubtful that it would bid for rights at that price—especially in view of Gillette's position.

What are the alternatives? The world series may disappear entirely from home television and be available only in theaters, or organized baseball will have to cut the price to a point where sponsors can afford to underwrite the costs—thus depriving the baseball players' pension fund of sorely needed revenue. Neither alternative is pleasant. Pay TV offers a happier solution. Through pay TV the world series can be assured for home television and the players' fund can receive the $3 million per year if organized baseball receives as little as 8 cents per set per game—assuming a 4-game series and 10 million fans per game.

EDUCATION

Pay TV can create a situation in which the potentialities of TV as an educational medium would be far more fully exploited than at present. There is a need for programs which are avowedly and systematically educational. Sponsored television cannot adequately discharge this obligation because the potential audience is small. Pay TV could increase the number of such programs and provide additional educational opportunities at reasonable cost to people, such as housewives, who are not ordinarily in a position to pursue educational objectives.

The interest of the United States public in education is clear. About $10 to $12 billion are spent on direct education every year. There is a large interest in adult education; it has been estimated that over 5 million Americans are enrolled in adult education courses of one sort or another; there are about 650,000 adults in private correspondence school courses.

Pay TV offers many educational possibilities. There might be high school or college courses offered on television with or without credit; the Pittsburgh educational TV station is currently working on a TV high school course. Correspondence schools might use TV either to give separate courses or as an adjunct to regular courses. Or stations and networks might present courses ranging from Shakespeare readings to how to dance, automobile mechanics, child psychology, and other subjects.

The FCC has made 251 channel assignments for "noncommercial educational TV stations." Up to March 28, 1956, the Commission had granted construction permits for only 38 noncommercial educational TV stations; at that time only 19 educational TV stations were on the air. The precise pattern that educational TV programs will take as between educational TV stations, ordinary local stations, and networks is impossible to predict. But just as it will tend to increase educational programs, pay TV will tend to increase the number of educational TV stations.

These are examples of the benefits to the viewing public from pay-as-you-see television in terms of programing. Given the economic ability to produce, there is literally no limit to the imaginative and creative ability of America's entertainment industry. With the broadening of the economic base provided by pay TV, "spectacular" can become descriptive of the average rather than the best.

NEW TELEVISION STATIONS

Under sponsored television there are today fewer than 450 commercial television stations and it is exceedingly difficult to see how there can ever be more than 600 television stations so long as their sole support must come from advertising revenues. This is not my pessimistic prediction. My authority for this is probably the most vocal opponent of pay television—Dr. Frank Stanton, of Columbia Broadcasting System. CBS has submitted to the FCC a detailed study which shows that even if we were not troubled by incompatible UHF channels—even if all channels were compatible VHF channels—sponsored television cannot support more than 588 stations in the entire country. CBS is doubtful even as to this figure. It describes its estimates as "conservative" and that the results are likely, if anything, to be lower.

How does CBS arrive at these figures? It obtained figures from the FCC which enabled it to estimate the minimum revenue necessary to support television stations in 1-, 2-, 3-, and 4-station markets, respectively. These figures—stated on the low side—are $200,000 per year for 1-station markets, $300,000 for 2-station markets, $400,000 for 3-station markets, and $500,000 for 4-station markets.

Next, CBS made a study for the years 1951–54 to ascertain the total advertising expenditures per TV home for each year. The figures—which according to CBS do not fluctuate materially from year to year—show a high of $16 expenditure per TV home for 3- or 4-station markets, with correspondingly lower figures for 1- and 2-station markets. The average for the entire country is $11 or $12 per TV home. Correcting this to total homes, on the assumption of 90-percent television saturation, the following interesting statistics emerge. We are reproducing them exactly as CBS presented them:

TABLE 3

	4-station markets	3-station markets	2-station markets	1-station markets	Total
Minimum revenues per station	$500,000	$400,000	$300,000	$200,000	
Minimum TV homes per market	125,000	75,000	45,000	20,000	
Minimum total homes per market	139,000	83,000	50,000	22,000	
Number of markets	78	30	57	52	217
Number of stations	332	90	114	52	588

A truly gloomy picture emerges. Whereas the FCC allocated some 1,800 channels to about 1,300 communities, CBS states that under sponsored television we cannot look forward to more than 588 stations in 217 markets. All the high hopes of communities for their own hometown stations are bound to be frustrated if economic support can come only from advertising. Not a very pretty picture—except for CBS and NBC, who do very well under this system since their revenue comes principally from sales in the top 100 markets.

This fate need not befall television. If pay television is authorized, a new and supplemental income becomes available to help carry the load. Based upon the figures set forth in table 3, it is apparent that the 20,000 homes in the 1-station market would need to pay for subscription programs less than $1 per month to produce the $200,000 minimum revenue required to support the station. In the 2-station market, the 45,000 homes would need to contribute only slightly over $1 per month to produce the minimum revenue necessary to support both stations. The sum of $1.34 per month from the 75,000 homes in the 3-station market and from the 125,000 homes in the 4-station market would produce the $1,200,000 and $2 million minimum revenues necessary for all of the stations in those markets.

Is the public willing to expend these sums for pay TV? Telemeter's experience indicates that these sums are a small fraction of what the public is willing to pay for superior programing.

Surveys in Palm Springs (where Telemeter conducted a pay-television experiment) and elsewhere indicate that viewers individually are willing to pay for high-quality programs presented without commercials. The Palm Springs survey indicates that the average subscriber to pay TV is willing to spend directly on TV entertainment about $1.50 to $2 per week, or roughly, $75 to $100 per year.

Sums of this magnitude can be obtained without using more than a small portion of the total hours available for TV broadcasting. Of the 126 hours during which a typical TV station is on the air per week, only 8 hours at an average charge of 25 cents an hour would be required to bring in from the average family a return of $2 per week or roughly $100 per year.

Using this figure, it is seen that 2,000 rather than 20,000 TV homes per market, as estimated by CBS, could produce the minimum revenue to support a station in a 1-station market; 6,000 rather than 45,000 TV homes could produce the minimum revenue for both stations in the 2-station market; 12,000 TV homes instead of 75,000 could produce the minimum revenues necessary for the 3-station market; and only 20,000 TV homes rather than 125,000 would be required to produce the minimum revenue for the 4-station market.

Imagine how our television horizons can be expanded with the additional support from pay television. Communities of 10,000 to 15,000 could look forward to their own television station just as they have their own radio station. The 1,800 television stations envisaged by the FCC need no longer be a mirage. It can come true.

We are not so naive as to believe that all of the revenue derived from pay TV would go to the station. Some of it must go for program costs and for administrative expenses. But, as we pointed out, these figures are based upon only 8 hours per week of programing. If pay TV consumed as little as 15 percent of the station's time, more than 18 hours per week would be available to help the station meet its operating expenses. Moreover, the bulk of the time would still be available for sponsorship, and revenue could be expected from this source. The fact that the public would pay for some programs would not detract from television's effectiveness as an advertising medium. The New York Times is an effective advertising medium, even though the reader must buy it. There is no reason why television should be any different.

The pattern most likely to prevail is that pay TV will concentrate where it has its greatest relative strength; that is, on a relatively few high-quality or special audience-appeal programs occupying a relatively small portion of the total TV air time. Advertisers, on the other hand, will concentrate where they in turn are strongest; that is, on programs for low per-viewer cost that will convey advertising messages with frequency and effectiveness and that will take up the bulk of viewer time. The composite would be a more varied, wider range of programs for the public to view.

Exactly how much aggregate revenue pay-as-you-see TV might produce cannot be forecast with accuracy. However, on the modest assumption that by 1960 only 25 percent of TV households will have installed pay TV and spend an average of $1 per week on it, the aggregate revenue would be about $600 million. On the high assumption that 90 percent of TV households will have installed pay TV and spend about $2.50 per week on it, the aggregate return would be over $5 billion. For 1965 the low figure is $700 million and the high figure is over $6 billion.

NEW HORIZONS IN TELEVISION

This new source of income should open up new horizons for television broadcasting. No longer need television be confined to some 200 markets, as CBS admits will happen under sponsored television. Communities which are capable of suporting their own radio stations or local newspapers will be able to have their own television stations. Medium-size communities will be able to have 3 or 4 stations instead of 1 under sponsored television. And large metropolitan areas should be able to support 10 or more stations.

The new source of revenue will also help immeasurably in the solution of a vexing problem which has been plaguing the FCC and this committee for several years. I refer, of course, to UHF. Now that the FCC has been finally and unequivocally advised that it cannot expect any new VHF channels for television, it must find a way to made UHF work lest television find itself forever confined to 12 channels. Pay TV offers the most hopeful solution to this problem. The reason is simple. The many witnesses who have appeared before you have all been in agreement on the following facts as to UHF:

One, there are no technical reasons why UHF service should not succeed.

Two, the problems plaguing UHF are incompatibility—that is, all television sets sold before 1952 were VHF only. A fairly substantial expenditure is required to enable VHF sets to receive UHF signals.

Three, where most of the popular programs are available on VHF stations, the public will not convert. Where many of the popular programs are available on UHF only, the public will convert.

This is where pay TV comes in. Many popular programs are going to be available only on the pay TV channel. No television set in existence today, whether VHF or UHF, can receive these pay TV programs without having some modification in the set. Thus, UHF stations start out at the same point as VHF stations. The supplier of pay programs will not have the predilection to deal with VHF stations that the networks do because those stations will not have a headstart in circulation. Similarly, the prejudice which now exists on Madison Avenue against UHF stations will not carry over to suppliers of pay TV programs. Both classes of stations thus start out even. That is all the UHF stations have ever sought. Pay TV gives them that opportunity. No one has yet found a way for sponsored television to meet this challenge.

Pay TV also offers a new-found freedom to all television stations.

Under sponsored television the television networks are the principal sources of popular programs. In most instances it is sheer economic folly for stations to attempt to operate unless they can secure a network affiliation. A network affiliation is the difference between success and failure, and the stations know it. These stations must therefore stay on good terms with the networks and do their bidding. If they displease the networks, the stations can lose their affiliation and find themselves without program sources.

With pay TV the picture will change. No longer will program sources be confined to the networks. All of the creative sources will be producing programs for television. With a dozen sources from which to choose programs rather than the present 2 or 3, stations will have a new freedom. They can then program their stations to meet the needs of their communities rather than delegate programing responsibility to network officials in New York.

Our counsel have advised us that no legislative amendments to the Communications Act are necessary to permit or empower the Commission to authorize pay-as-you see television. I am not a lawyer and I will not attempt to detail our counsel's reasoning and conclusions. These are set forth in detail in Telemeter's comments in FCC Docket 11279. What then does Telemeter want from your committee and the Congress?

All that we ask is an immediate and forthright declaration from you that the Commission should take immediate steps to give pay-as-you-see television a chance; that the Commission should place no artificial barriers in its path and no artificial restrictions upon its use; and that the air waves should be freely available to those entrepreneurs who are willing to risk the substantial sums of money that will be entailed in producing and distributing pay-as-you-see equipment and the superior programing which it will make possible.

Not so long ago the Reader's Digest decided to make a major shift in its policy by accepting advertising. Up to then its sole support was what subscribers paid for the magazine. Also not so long ago the publishers of magazines which are available in food stores decided to charge for their magazines, which up to then had been free to the customers—the costs were borne by advertising. These organizations did not have to engage in speculation with Government agencies as to whether these changes would increase or decrease circulation or would aid or impair competitive publications. These companies were permitted to risk their money and let the public decide whether the decision was wise or foolish. That is the American way. All we seek is the same opportunity. Let the public decide whether they want to pay for television programs.

Senator BIBLE. There is one more witness to be heard. I cannot be here as early as 2. I can be here at 3. There is a possibility that some other member of the committee might be available at an earlier time. I think in order to be safe we ought to stand in recess until 3 o'clock.

(Whereupon, at 12:25 p. m., a recess was taken until 3 p. m. of the same day.)

AFTERNOON SESSION

Senator BIBLE. The committee will come to order, please. When we recessed this morning, we had one further witness to be heard, Mr. Ray Kohn, of Allentown, Pa. We are happy to have you with us, Mr. Kohn. You may proceed.

Mr. KOHN. Thank you, Mr. Chairman.

STATEMENT OF RAY KOHN, OF ALLENTOWN, PA.

Mr. KOHN. Mr. Chairman, after your remark about the volume of one of the witnesses this morning, these are exhibits in here and not a written statement. So the volume is nowhere near as long in wording as it might seem.

Senator BIBLE. Proceed, in your own manner, with the interest of time in mind, as well.

Mr. KOHN. I have no written statement. I am speaking from notes.

Senator BIBLE. Very well.

Mr. KOHN. And I would really appreciate it if I get hung up—I am not a professional witness—and if I get hung up, if there is a convenient question that counsel can ask, I would appreciate it.

Senator BIBLE. It is most refreshing to find someone who is not a professional witness. You ought to do very well.

Mr. KOHN. You have found one, sir.

My name is Raymond F. Kohn, and I am president and general manager of the Penn-Allen Broadcasting Co., of Allentown, Pa. Penn-Allen is the licensee of an exclusively FM station, WFMZ, and the construction permittee of WFMZ-TV. That construction permit—we did build and we went on the air with our station. However, it was suspended with the permission of the FCC and our CP kept in force. It was suspended last April 15 of 1955. We had been on the air approximately 4½ months.

I would at this time like to identify my colleagues who are here with me to help me with the exhibits. Horace W. Gross, of Allentown, who is a member of our board of directors and who is responsible for the artwork on our exhibits; and my brother, Earl Kohn, of Washington, who is also a member of my board of directors.

Senator BIBLE. We are very happy to have both of you with us. You may proceed.

Mr. KOHN. I have been in this chair before—in fact, 2 years ago under the subcommittee of this committee; Senator Potter was chairman at that time, and we presented exhibits similar to these, but with a different objective in mind. At that time we felt, and still feel today, that this is a television hearing and therefore the committee ought to have some pictures to look at.

Senator BIBLE. I think they are helpful.

Mr. KOHN. So we have gone quite extensively into giving picture stories of this problem as we have seen it. I would like to mention right here at the outset, also, that the cost of reproducing these exhibits and the preparing of them is being borne by one of the proponents of subscription TV. We could not afford it ourselves. Two years ago we did it at our own expense. Frankly, after our demise in UHF broadcasting, we could not appear here and go to the expense that we did 2 years ago. However, our exhibits are our own. Our thoughts are our own, and everything we say here represents my company's viewpoint and no one else's.

The reason why we are here is because my company is in agreement with the present proposal made by the proponents some months ago, that subscription TV be given a trial for UHF stations that are in distress. In that regard, a year ago in June Penn-Allen presented to the Commission in a formal petition which I have here in my hand, and if by reference it could be incorporated——

Senator BIBLE. It may be incorporated by reference into the record, and will be retained in the committee's files.

Mr. KOHN. Showing a detailed analysis of what subscription TV means to an individual market, an individual station, how it would be put on, how much revenues and so forth—and I will show that in much briefer form than this in one of the exhibits we will show today. But at that time we felt—in fact, it was when the NARTB was meeting in Washington last year—that everybody was talking about subscription TV—voluminous documents, propaganda back and forth, arguments—but nobody had any real facts.

Nobody knew whether the public would take to this or not. Nobody knew whether it was in the public's interest because you cannot determine that until there is some way for the public to judge whether or not it is in the public interest. The second thing, is it going to be successful? Well, nobody knows whether this is the answer to the UHF problem, but it can be, it may well be, and if it is we are in favor of it. We can frankly say we do not know whether we are in favor of subscription TV but we will know after it has been given a fair trial, and I think a great many companies and my colleagues in the broadcast industry are in that same position. They don't know whether this is a Frankenstein or whether it is a savior, as far as that is concerned, and we are surprised that those opponents of the system have already made up their minds it is a Frankenstein that is going to destroy practically everything we know in civilization today.

I would like to say that since I sat in this chair before, 2 years ago, that we speak from more experience now because we have had a community television station on the air. At that time, we did not have one on the air. We were constructing at that time, and we have known what that thrill is of putting a community television on the air, in a local market—a local station, no network; everything was of our own making in the way of programing and what film we were able to purchase.

Senator BIBLE. This is Allentown, is it?

Mr. KOHN. Allentown, Pa.; yes, sir. It is not a small community. The population is 106,000 by the 1950 census, but it is a three-city market—Allentown, Bethlehem, and Easton, as you can see on the exhibit.

There are half a million people that live within the circle encompassed by our signal when we were on the air with television, and the fact that we were not able to make it with a half million I do not think bodes well for a great many communities that cannot possibly have that many people. However, we hope to prove, before our testimony is over here, that there may be a chance even beyond our realization now to get what everybody foremost here, and in fact for the past 2 years, has been trying to get, and that is the solution to a nationwide system that will utilize at least a far greater number of the television channels than are now presently operating.

I think there is a good possibility of that if this thing is given a try.

We had the thrill of opening a station, but I will admit here that the night that we closed down our station that I watched a lot of young people—grown men and women—with the tears running down their cheeks, because that signal had to go off the air. That is my own staff and quite a number of people we worked with in the community that came up to bid us farewell, hoping we would get back on the air somehow. We think there is something singularly peculiar about serving the public. Anybody that has the responsibility of a television license, or for that matter anybody in the chair, including a Senate chair, knows when he is serving the public, and when he is not. Those most on the defensive are the ones that certainly have something to be defensive about.

It would be possible for us to be entirely bitter at this point because we went through this whole thing in the last 10 years in an exclusive FM broadcast station. It does not take too much for me to remember vividly the wild acclaim given to FM back in 1946—1945 and 1946—as soon as the war was over. Here was a brandnew type of broadcasting, far superior to the present standard aural service that was being given, and we believed that, because many of us who started this company used it during the war and we knew the technical difference and superiority. FM is still head and shoulders technically above any AM service being rendered the public. We have lived by—I don't know how to word it, but we used to joke up in our studios that we heated the place with the sheriff's breath for about 8 years, as far as the FM operation was concerned.

Now, I might mention that our interest in television is not new or confined to our UHF application 2 years ago. In 1948, when television was first opened under the Third Report, there was a VHF channel allocated to Allentown-Bethlehem-Easton, just 1 VHF channel for that whole populous area. We were one of those who contested for that channel. We have no one behind us in the way of a manufacturer or manufacturing concern or newspaper or an AM station. All of our money was raised by ourselves among the people of our community to finance the venture. They did it in 1948, and we went through complete hearings before the Federal Communications Commission, battling 2 newspapers and the Philco Radio Corp., and if we had had a couple more months we would have had a V in Allentown right now, but the freeze went in before an initial discussion was handed down.

However, we cannot kick at that, and at that time, our attorney in Washington wanted to know if we wanted to fight changing the channel to UHF, and I say this without any sense of self-service that we believed then, and we believe today, that 4 channels in the Allentown-Bethlehem-Easton area of a half million people are better than just 1 V that would be available there.

We did not fight the moving of that 1 VHF channel over to Lancaster. In our statement 2 years ago we based every bit of our emphasis upon the need for local expression and its rightful emphasis in this whole question. Our position has not changed. I would like to make a short quotation from our testimony of 2 years ago before the Potter committee:

Before we present what we believe is a sound and workable approach to the UHF dilemma we would like to bring out briefly and emphasize with all the vigor at our command one aspect of this problem that in our opinion should have precedence over all other considerations. It has been touched upon in other testi-

mony but has not yet been given the emphasis it so surely deserves. We refer now to the 2 words "local expression." We think it pertinent, but not material to this controversy who utilizes what channels, but that all channels necessary to a nationwide truly competitive system be utilized. To achieve this objective, a fair and proper climate must be provided so that television on the local level shall have a reasonable chance to grow in all communities across this Nation wherever the economic soil is rich enough to nurture it.

Our position is the same today, only emphasized a thousand times over by our experience of operating a community television station which, we think, bore out what we said before we went on the air and told the Commission we would do in this matter of bringing out local expression with our local live programing in our community.

We think that the unused and abandoned TV channels constitute, right now, the greatest and most tragic waste of one of the most important natural resources that exists in this country today. It is just one man's opinion, but I think that the decisions that are made today by those in responsibility to make them have as great an influence on the social and political development of this country as some of the things that have happened in the past, like the industrial revolution. We are dealing now with communities, and the tremendous impact on tomorrow will be decided, in some part for sure, by the decisions that are made by the Federal Communication Commission, and whatever recommendations this committee makes to them.

I think it is almost impossible to visualize the difference between 1,500 television stations across this country, and 4 or 5 hundred, as to its impact for the good of the country or the evil of the country. We know what the telephone itself did as far as the social behavior of our people is concerned, bringing them together. Now, we have sight and sound together, and it is just a logical extension of the radio service which has developed to a great degree in this country, where you find that there is a lot of local expression and many of the local people get before radio that will never have the opportunity to get on television.

Now, in order to show our belief and our sincerity in these two words "local expression," we have prepared an exhibit, and that exhibit is Exhibit A [3] which is the first exhibit in our folder. It is not a map exhibit. We prepared this for the benefit of the committee, who may never have had a detailed look at the possibility of what a local station can do in the matter of presenting local programs, and the type of programs that exemplify what we mean by local expression. In this exhibit we have taken just one 2-hour show which, with FM, is put on the air every night from 7 o'clock in the evening until 9.

Needless to say, if we had network we would have had a hard time getting those 2 hours in there, but we did not, and the fact that we did not have a network did not keep us from going on the air. Maybe we were stubborn or maybe we were foolish, or both, but we think we have now proven something, at least to ourselves, and I hope in some way in some small measure I can prove it to this committee.

In this exhibit everyone of the people that you see here, and the civic organizations and the features, the hobbies, the occupations, the special events, the medical societies, the red-feather agency—77 hours

---

[3] This exhibit and others referred to by the witness are set forth at the end of his testimony, starting at p. 1129. See p. 1203, below, for the formal order inserting them in the record.

are represented in educational programs alone in that 2 hours every night on WFMS-TV. In addition to that, we have listed here—none of these people, of course, does anyone know, with the possible exception of Gene Autry and a few other celebrities that came to town that we, of course, got on the air. But we think wrapped up in having these people come and tell their stories and show their talent in front of our cameras did more for Allentown than certainly the Philadelphia stations—were of more worth to it than the Philadelphia network programs that are now servicing Allentown. And there is no television station in Allentown now doing this sort of thing. The logical question arises—before I go into that, though, if you will turn to page 7 of this exhibit A, and just break down in that 4½ months of programing, you will see that we had 77 hours of educational features and 123 hours of entertainment on this 7 to 9 show.

Now, the most surprising thing, and it will be a surprise, I think, to a lot of our colleagues, because I have certainly read the testimony of those—I have tried to keep conscientiously up with it, and I have sat here for many days listening to broadcasters saying that you have to have network programing to make a station go. I was very much impressed with the testimony of Mr. Moore of Los Angeles who, in a big market, testified that local live programing certainly was salable programing, that it could be successful that way and it can compete against network programs. We think we showed that, because this 2 hours in the evening, even though it contained a tremendous amount of educational features in it, was our most salable program during the entire broadcast schedule.

Thirty-six percent of the revenue—in those 4 months we billed some $21,000 in round numbers—and 36 percent of that revenue, the spot announcements, were placed on this 2-hour show every night. Even public service can pay off, and I am not against having public service pay its own way, if you can do a good job of it, and at the same time I think it bodes well for your advertisers.

Mr. Cox. Was this local advertising?

Mr. Kohn. Yes, with one exception; we have one national account in that respect.

Mr. Cox. Do you have any idea what rate of viewership you achieved with this?

Mr. Kohn. Only insofar as there was enough talk around the time that the merchants asked to have their announcements placed in that period, and strangely enough, even though we were about 56 percent local live of our entire schedule—we believed in it wholeheartedly; and in fact we started out with more film, and as time went on we substituted local live programs in place of film—but 94 percent of the revenue of our station in our first 4 months of operation was all placed in our local live shows as opposed to the film shows.

Mr. Cox. Do you have any ratings of comparable audience to the other stations in this area at the time you had this program on?

Mr. Kohn. Unfortunately, at the time, we had set our schedule to take our first ratings 6 months after we were on the air, so we never got an opportunity to actually put a yardstick. We did have a good indication from the number of converters that were sold. We do know that our Saturday night hoedown—which would match in its excitement and real spontaneity any live television—we had a 2-hour hoedown on Saturday night in our studio; we had three or four hundred people in there. We do know that it was reminescent of the early days of television when only the pubs had a television set, because in the upcountry north of Allentown they tell us that the UHF-converted pubs up there were behind. They just couldn't accommodate all of the people that came in from around the countryside just to watch that hoedown.

We were tremendously encouraged by the fact that local-live programing had been sold down the river too much, I think, in these hearings. For instance, in this show we used the hometown newspaper concept. Certainly, we gave them international and national news as part of it. We gave them the national sports. But we had the society page in there, and we had the entertainment section. We had the classified ads represented by our advertisements. Putting local people in place of your network personality—I still believe that more people in Allentown would rather watch their own people than they would watch personalities from outside; at least a good portion of their time, and at least they will turn to us as much as they will turn to a network show.

Local live programing can compete with network programs and outcompete a lot of the film programs that we had. That we knew for sure. In that respect there is a residual benefit that maybe I should have mentioned briefly in passing. We had a staff of 28 people for television. It took about 20 of them to run this show in the evening. It would be impossible to keep it up too long because we had salesmen pulling cable and every member of the staff was appointed to dig up material to put into this 7 to 9 show.

Steve Allen had an easy-to-get 2 hours in evening compared to putting on our 2 hours of material which we had to dig up. There was something I saw happen to my staff up here. Not a single one of them was in favor of this thing when it started out, but by the time that program had gone on for a month, they really became a dedicated bunch. They really say that this hometown material that we brought in and put on television, and the tremendous response—I might mention we received in that period of 4 months between 4,000 and 5,000 letters from the public, and I am not sure that that is a great amount or not. There are no box tops or anything connected with it, but I do think that it is significant that it was a different type of letters. Very few of them were criticizing. They just liked the idea of this, being able to see all of the various features. We had fire engines running around our studio putting out fires from a voluntary fire department. As to the 4-H Club, if a kid had raised a bull that won a prize, that bull would come into the studio that night.

We tried to make news before the camera. We had a lot of fun with it because the newspaper, to get a picture for the next day, had to come into our studio to take the pictures. That is the real spirit of competition, which I think again we should have in a lot more cities across the country. Television is a competitor of newspapers and brings about a healthy competition, which is fast disappearing as far as the newspaper industry is concerned, even in the cities like Washington, which is a very large city, but the newspaper ownership—the mergers are taking place every day.

As I said, none of the members of this committee, or nobody in this room, knows these people or anything else, but I think you multiply this type of programing clear across the country in towns of 10,000 and up and you have got one of the basic worths and the real grassroots approach to communications, the real worth of the future of television, if it is going to serve the public. And I have been impressed a great deal that we have too much self-interest testimony, and not enough public interest, as far as the whole scope of the United States.

It isn't important whether we exist in Allentown or not, but it is important that a television station exists in Allentown. And I also would like to bring out here that we think it far more important that television exists in Allentown than it is to have Philadelphia just claim another half-million people to their already 4 million people that they have, which enables them to take another couple of hundred dollars onto their rate card. I think it far more important for us to get $200 up in Allentown than it is for the rate in Philadelphia to be $2,000 an hour rather than $1,800 an hour.

In the previous hearing—I am sure if Senator Potter were here he would remember it—we threw out a challenge to our Philadelphia stations, that if they would promise under oath to the Commission to serve our community in Allentown the same way we promised under oath to do it, that we would tear up our testimony and forget all about any protest whatsoever, and just to bring the record up to date, nobody has as of yet accepted our challenge, even in the matter of one-thousandth of 1 percent as far as serving Allentown on a local basis.

Another aspect of the need for local television stations hasn't been brought up, to my knowledge, before these hearings, but it is important to every citizen in the country, and that is the matter of talent. We have dug up talent in 4½ months that had a very good chance to go on and become talent networkwise. I am sure that any of us that watch television, or have been on a regular basis for a number of years, are convinced that we can use some new faces now and then on television. I think the mortality rate of comedians is growing faster every month, but in radio, practically all of your big-name stars in radio started in such stations as Allentown or in Pueblo, Colo., or in places such as Reno, Nev.

Senator Bible. I was going to say Waukegan. [Laughter.]

Mr. Kohn. But I don't think that has been brought up, and emphasized. This includes what everybody sees on television, developing the talent in the country, which will be our future stars on television; and not only that, but in editorial work, public service work, and other things as well.

The sports director that we had on our station has since, in just a year's time, gone up to where this year he is going to be one of those participating in bringing major league baseball to the city of Philadelphia. So if he had not had that break, so to speak, on a smaller station—and I was able to recommend him highly, he got the chance, he made good on the chance, and that is where your talent for the future is coming up in television. It is not going to be the NBC page boys, although some of them make it. It is going to be those who have learned their trade in the smaller stations, and it is a great satisfaction to my manager to see one of his boys go up the ladder and make a real success. It is one of the compensations, I guess, that you get in place of money.

Mr. Cox. Is there any local service being supplied to Allentown by either the Philadelphia or Lancaster stations in the sense of support for your community chest or editorial projects or anything of the sort?

Mr. KOHN. No; there is none whatsoever. The extent of the participation of our people in the area, on the Philadelphia stations, are participants on quiz shows, things of that nature.

The extent that our advertisers participate is in these stringers at the end of a television commercial: "In Allentown, see so and so," and they rattle off about six names, and that is about the extent that an Allentown merchant could possibly participate. He cannot pay the rates. We do have one other, for the record. We have a large department store that is publicity minded that actually sponsors a 5-minute program every night on a Philadelphia station, but I won't give my opinion as to why he does that. It is certainly not to justify the expense versus the worth because it comes at 11:30 at night anyhow.

We had another boy who had never had a single bit of commercial television experience who today is program director of a station in Arizona. It is possible to discover real talent that will otherwise never get to the top, and I will go on record as saying that there is more talent undiscovered by 1,000 percent, than you now see on television today, real good talent.

You read about these Cinderella stories every once in awhile, but they go more by happenstance in the movies and so forth than they do by the way our industry works. They make their name in a small market, and you can't keep them and you don't want to keep them. You want them to get out where they can serve more people.

Now, I would like to present—I will start talking with pictures now.

Senator BIBLE. Fine. You just proceed.

Mr. KOHN. I would like to show you why Allentown does not now have local expression in its community. The solution, 2 years ago, that we presented and which I can show rather forcefully, I think—our solution to this UHF–VHF problem 2 years ago was cutting back the powers and antenna heights of stations. We believe that is still the only solution, drastic as it is, that will allow hundreds more stations to get on the air. In other words, confining the signals of all stations, V's or U's, to approximately the area of influence which you might call their local influence, their market, so to speak, and that all of them have a market which most communities are capable of supporting.

I was sitting here in this room 2 or 3 weeks ago and heard Senator Pastore remark, in speaking of Providence and Boston, "Why should Boston serve Providence and vice versa; why isn't it enough for Boston to serve Boston," and he came out with a rather flat remark, "Isn't the whole solution to this problem just cutting these signals back to their own sphere of influence." But then he added, which is our despair, also, "Who has nerve enough to do it at this point," whether the Commission—it is a terribly drastic remedy. We would still like to see somebody with nerve enough to do it, but that is major surgery.

I think we can show you why all of the minor surgery that has been proposed, before we finish here, is going to have little or no effect upon bringing a lot more stations on the air. Since we despaired of this happening, 2 years have gone by. We put our mind to an economic solution, and that is where this pay television comes in, the reason why we are appearing here today.

As I mentioned before, a year ago we conceived the idea of a pilot station to establish the merits and benefits of subscription TV, or vice versa. That was submitted to the FCC in June, and we made a very detailed analysis on how it would work. The FCC, a couple of months ago, rejected this petition as premature since they had rulemaking decisions pending before the Commission on this whole subject.

Senator BIBLE. This was a petition asking to put in pay-as-you-go TV or subscription TV?

Mr. KOHN. That is correct.

Senator BIBLE. They ruled it out because there was no general rule on the subject; is that correct?

Mr. KOHN. It is a very controversial thing, and they said there were several serious questions to be decided before they thought it should be even put on an experimental basis. The idea was not turned down, but they said that it was premature.

Senator BIBLE. I understand.

Mr. KOHN. We just thought it made a lot of sense, before decisions are made, to ascertain some facts to guide you in the making of those decisions, and it is in detail in our petition before the Commission, which we are incorporating by reference. Subscription TV may be the answer, but certainly we are not going to know unless it is tried on a fair, realistic basis.

Now let's take a look and see why all present seriously considered proposals for solution of the UHF–VHF dilemma will not be the answer. It is very possible that some small number of stations may benefit. Television on a healthy, nationwide, really grassroots basis will never be realized by any drop-in procedure or deintermixture unless it is done on a drastic scale, and I have not seen that proposed as yet. I have heard of selective deintermixture, I have heard of limited drop-ins, and CBS proposes their two plans. None of them come close to giving us what we are looking for, I hope, on the priority 2 basis—and I think it should be priority 1—the whole expression idea that every community has the right to its own self-expression through this new electronic miracle medium. This is a map (referring to exhibit A–1—see p. 1135 below), this is a map of southeastern Pennsylvania. That is our home area. Allentown is up there near the New Jersey border. Bethlehem and Easton comprise the three-city market.

The UHF stations are shown in yellow. The yellow dots (shown as lighter colored dots in the maps herein) are the UHF stations. Those on the air are ringed with a black outline. The VHF stations are shown in red (appearing as darker dots on the maps herein). As you know, even in just that southeastern section there, the yellows have it as far as allocations are concerned. There are 5 VHF allocations, in 3 cities, in southern Pennsylvania. All five of them are on the air and all of the allocations are taken in VHF. There are 20 UHF allocations in that same area, in 13 cities: 8 on the air, 4 U construction permits, 3 U's suspended (were on the air but suspended), and 5 got grants from the Commission (construction permits) but relinquished them back to the Commission. That is a pretty sorry story, at least as far as carrying out the sixth report, for just one small area of Pennsylvania. A great many people live in that area. It is one of the most highly populated areas in the United States.

The smallest city there is 15,570, and that is Sunbury, way up in the left-hand corner. We say that Sunbury should have a station even for 15,000 people, and that it is possible. We will try to at least give some measure of proof to that a little later on. Now let's look at the coverage of those eight UHF stations that are on the air right now (referring to exhibit A-2—see p. 1136 below). As you see UHF—even if VHF never developed—UHF gives pretty good coverage to that area, excellent coverage. In fact, if you put UHF in those 3 red dots there, you have a far better television system than we proposed 2 years ago eventually, but UHF can do the job. The Commission did not err at all in picking the places to put the allocations, they just intermixed them, and our solution, or our contention, is that a deintermixture of Philadelphia or Wilmington or Lancaster is not the answer to this problem.

The answer, unless you want to go to an all-UHF type of operation—but to put one more V in Philadelphia, to give more competition for one city, is just going to complicate the whole area that we are talking about now. It does seem a terrible shame that over there at Lancaster there is 1 VHF station that is spoiling the development of 8 UHF stations. I hope that if nothing else is done, at least for the sake of our own section of Pennsylvania that that will be one of the deintermixed cities, and let all of those U's compete together there. Ironically, that channel there in Lancaster is the one that in 1948 was up in Allentown. They moved it to Lancaster in the sixth report.

Senator BIBLE. What is the population of Lancaster, just roughly? You say Allentown is 100,000; how many in Lancaster?

Mr. KOHN. About 125,000.

Senator BIBLE. A comparable city.

Mr. KOHN. I have it here.

Senator BIBLE. That is all right, that is close enough.

Mr. KOHN. Oh, Lancaster is much smaller than that, it is 63,774.

Senator BIBLE. You said Allentown was 100,000.

Mr. KOHN. 106,000. That is the 1950 population, 106,756 for Allentown.

Senator BIBLE. You may proceed.

Mr. KOHN. These are all 1950 census figures, any figures that we give. Now you have seen the UHF coverage. This is the coverage of stations now on the air and, mind you, there are 12 UHF stations that are not on the air. There are only eight UHF stations on the air. Now let's see what happens when we drop in just five VHF stations and their coverage (referring to exhibit A-3—see p. 1137 below). In 3 cities, 3 cities are covering that whole area, there, of 16 cities, and it is rough going for those U's that are on the air. I doubt if there is a single one of them making money at the present time, and some of them have been on for 2 years now. But that is what we mean by saying that deintermixing and giving another VHF station to Philadelphia only complicates the problem. Our contention is that those 16 cities, all with a television station, would certainly serve the public and serve the future of television and the future growth of this country far greater than limiting it to a VHF service in Lancaster, Philadelphia, and Wilmington. I might say here that these coverages are all actual coverages today, based upon their antenna heights and their powers. We plotted every one on the basis of the FCC contours. If we were to take the coverage that they claim on some of their rate cards, we would go off the map here on many of those.

Senator BIBLE. I think you have done a very effective job now of presenting the problem. Now give us the solution.

Mr. KOHN. First, may I show you, so that you will not think that this is an abstract example—can we go over to Ohio now and see what happens in Ohio, which is even more of a dramatic exhibit?

Senator BIBLE. This is designed to show the same thing in a different place; is that correct?

Mr. KOHN. That is correct; just to show you that it exists in many places in the country.

Senator BIBLE. I think we should be able to move through this part of your testimony very quickly——

Mr. KOHN. I will move this very fast and just give you totals on here without explaining them. These (referring to exhibit B-1—see p. 1139 below), are all the sixth report allocations for Ohio and the southern part of Michigan and, as you see, a litle bit of Indiana, Kentucky, West Virginia, and Pennsylvania. In all there are 24 VHF allocations, and 22 of those VHF's are on the air. In that same area there are 67 UHF allocations, and of that number there are only 11 out of 67 on the air. There is a great disparity there. And I might add, too, that those 14 VHF's are contained in only 6 cities in Ohio, and the 41 UHF's are in 14 cities, so when you are talking about local expression, we are getting just areawide expression from the VHF's now.

Senator BIBLE. How many U's now in operation?

Mr. KOHN. Eleven out of 67 that were allocated, and there are 10 that have either suspended operation or relinquished their grants—all UHF.

Now this (referring to exhibit B-2—see p. 1140 below) again is the plotted coverage of the UHF stations on the air that we show, those 11 stations. Now if you take the VHF coverage of those six cities (referring to exhibit B-3—see p. 1141 below), there goes all of your yellow coverage. The overlap—you just cannot get away from it in the whole State of Ohio and Michigan. There is Fort Wayne out there, which has become the object of pride of the UHF because it is the only city in the country that is not overlapped by VHF coverage. But here we have plotted out—and that is why I just do not see how you are going to, with selective deintermixture or drop-ins or however, you are going to get rid of the overlap. Our solution is to cut those red circles back to their own communities in order to let the other communities live with local television, but that, as I say, is a very drastic solution.

There is no question about it, the reds have it as far as coverage is concerned. I would like to point out, too, this is present coverage. Many of those were seeking higher antennas and greater power: going to full power, that coverage will increase. That is true, of course, of the UHF as well as the VHF's.

Now let's take a quick look, finally, at New England, and we will do that very rapidly, Mr. Chairman.

Senator BIBLE. I think you have made very effective exhibits. I think they point up your problem.

Mr. KOHN. The red dots are very few and far between as far as the New England area is concerned (referring to exhibit C-1—see

p. 1144 below), and for this area we have—if you want me to recap it or I will just go through it——

Senator BIBLE. It looks as if you have six V's, if I add correctly.

Mr. KOHN. You have a total of 8 V's, in 6 cities, the total—or rather 4 cities I beg your pardon.

Senator BIBLE. And you have how many VHF's?

Mr. KOHN. Eight in that area; eight allocations.

Senator BIBLE. Six on the air?

Mr. KOHN. Yes, the others are in contention; they are applied for and being contested. There are 34 UHF allocations shown there, and of those there are only 7 on the air. Priority 2, as far as the sixth report is concerned, to get the greatest amount of local expression, at the present time it is—I hate to use the word—but it is a farce as far as getting local expression in those communities which really need it most. And as far as local expression is concerned in these VHF stations, there is so much network time on them that the local expression time is limited either to off hours, certainly not in the good hours. Now if you will flip, we will see the UHF stations.

Even with that number on the air (referring to exhibit C-2—see p. 1145 below), they do a fairly good job on the western part of southern New England there. Boston, of course, is shown up there. These are as of January 16. We had to take the cutoff date somewhere, and our source for these, I must mention, is Television Digest Fact Book. I'm sorry I didn't mention that fact before.

Now, let us see how the VHF—even with the 8 VHF stations in the 4 cities (referring to exihibit C-3—see p. 1146 beliow), goodby UHF coverage as far as not being overlapped. There is no such thing as any station. Now, up there in the left-hand corner, around Albany, is where this controversial drop-in is. I don't see what good it will do, other than to complicate things for all of the UHF stations around there.

Mr. COX. This is one area where at least some of the local UHF broadcasters have indicated that they thought deintermixture would be helpful—that is, to deintermix the Hartford and Providence markets, and to provide an additional V, by whatever means, in the Boston area for service in Cambridge or Worcester—that would be of some help?

Mr. KOHN. If I were living in those cities, and had a UHF, or vice versa, I would be arguing the same thing. I am talking now nationwide without any regard at all to whether one operator is affected or not. Certainly helping out one operator in Hartford, or Worcester, is not going to help the whole Western part of the United States, or the Midwest, or the South. This problem is prevalent all over, and that is what we are going to show you now.

We will extend these regional areas into a complete map of the United States (referring to exhibit D-1). (This map could not be reproduced. It has been retained in the committee files.) There are all of the sixth report allocations in cities 10,000 and over throughout the United States. It is impossible to get it in an exhibit big enough to show more there than a general impression. But there are all of the U's and all of the V's, and if you are interested in totals on this, or if you are interested in impressions, the totals can be read later——

Senator BIBLE. If you have them at your fingertips you can read them into the record now.

Mr. KOHN. Certainly.

In all of these States there are 518 VHF sixth report allocations of 10,000 or over—located in communities of 10,000 or over. There are 1,323 UHF stations allocated through the United States.

Senator BIBLE. How many operating of that number?

Mr. KOHN. Of the VHF there are 443.

Senator BIBLE. 443 VHF's operating?

Mr. KOHN. That is right.

Senator BIBLE. How many UHF's are operating?

Mr. KOHN. No, that is the total number of stations operating; I beg your pardon. There are 348 VHF and 95 UHF, or 67 percent of the VHF stations are on the air, and only 7 percent of the UHF stations are on the air. Even though you have many, many more UHF allocations than VHF's—and that is the whole purpose to get us a nationwide system of television. In other words, 24 percent of all of the stations are all that have been allocated—or all that are on the air. And this is in towns of 10,000 and over. I am not talking about one little town out in your State, Senator, Goldfield, which has an allocation.

Senator BIBLE. It couldn't support TV for a good many years.

Mr. KOHN. It will take some time. We hope some day we will get television there for the benefit of the people in Goldfield.

Senator BIBLE. I don't kid myself into thinking that that is in the immediate future, so it is perfectly all right.

Mr. KOHN. We will admit there are many like that, and that is the reason we did not include them in this. We used 10,000, which we think has the possibility of being able to support a television station.

Senator BIBLE. I think you are making an effective case. You have given us the problem. You have taken exactly 1 hour to present the problem. Now, can you give us some idea of your suggested solution? Could you highlight that for us?

Mr. KOHN. Could I finish with this map as far as to show you the UHF——

Senator BIBLE. Certainly. I am not trying to cut you off, except that we do have some limitations on our time.

Mr. KOHN. I know that, Senator, and I am aware of the fact. However, I don't want to leave a wrong impression here as far as the United States picture is concerned, so if we may have the first overlay here (referring to exhibit D-2). (This map could not be reproduced. It has been retained in the committee files.) This shows the UHF stations that are on the air, those 95, and their coverage.

I might mention that a great many of those that show that they are on the air, there is a red dot in the middle that says that there is a V that is not yet on the air; and it is very possible that it will have a very serious effect upon the U when it does get on the air. They are usually inherent.

Senator BIBLE. This is the UHF coverage?

Mr. KOHN. Yes; this is the UHF coverage, but in many of those cities that are now on the air with UHF a V will soon be on the air, and with the consequences that—we have already had a tremendous amount in the record as to the consequences of that.

Now, if we can show the VHF (referring to exhibit D-3). This map could not be reproduced. It has been retained in the committee files.) There are 348 stations, and the amount of area that they cover. I must say that the Commission, in meeting priority 1, can do it with practically entirely VHF. On the other hand, if it gets to priority 2—we may not ever have a priority 2 if we put too much emphasis on this priority 1, that everybody should have just one signal. I say that every city of 10,000 or over, or any city that can support television, should have its own television station to view in its own community, and for local expression.

A bit more graphically, we would like to show you here (referring to exhibit E). (This map could not be reproduced. It has been retained in the committee files.) These are pie charts, the circles have no bearing on coverage; however, the slices in the pie indicate—the hundred percent of the circle indicates the allocations. The red pie slices there indicate the percentage of the allocations that are being used, and that, again, in cities 10,000 or over. It is quite effective to see here that when you get down to only an average of 24 percent for the whole United States, after 3 or 4 years here now, and stations going off the air faster than they are going on, that we are backwatering here rather than making progress.

Here is something certainly recognizable by every Member of Congress in this next exhibit, probably more so in the House than in the Senate, but these are counties that are affected. If we may show the first map first (referring to exhibit F-1). (This map could not be reproduced. It has been retained in the committee files.). That first map—and this is the local expression as we now have it throughout the country—these are the counties in which the main studios of existing television stations are located. And as you can see there, and I have a recap of those, there are only 281 counties in the whole United States that have local expression; that is, a television studio that people of that county—and not to say the political aspirants and so forth of that county—can go to their own station to reach their own people.

Now, let us look at what might happen if we can get television in every city of 10,000 or over. You would see that we have filled in there (referring to exhibit F-2). (This map could not be reproduced. It has been retained in the committee files.) There are 686 counties in the United States which will have the medium of local self-expression through their own television studios located within their own political subdivision. We thought counties would show it effectively.

Senator BIBLE. Do you have anything that indicates how many people in the United States today have television available to them, either UHF or VHF?

Mr. KOHN. Available to them, sir, or available to them from a local source?

Senator BIBLE. No; available to them from any source.

Mr. KOHN. I do not have those figures, but I am certain that there aren't too many——

Senator BIBLE. Mr. Cox advises me that probably 95 percent of the people have some form of television available to them.

Mr. KOHN. Yes; they are getting at least one signal from somewhere, or they are getting it by a community cable system or something of that nature; but the point remains here that if we can get television on a nationwide basis in cities that can support it economically, we will add some 26 million people that will have their own means of self-expression through their own nearby television station.

Senator BIBLE. Yes; I think your exhibits have effectively demonstrated that.

Mr. KOHN. The next one is one I don't think the committee has seen, or has had any indication of in the testimony thus far. This (referring to exhibit G-1—see p. 1151 below) is our State—or excuse me, our Commonwealth—of Pennsylvania. We do not call this the State of Pennsylvania. [Laughter].

These are the community antenna systems that exist in the State of Pennsylvania alone.

Senator BIBLE. How many are there by number?

Mr. KOHN. Seventy-seven community antenna systems that exist in the State of Pennsylvania alone. I heard the word, in connection with either Mr. Landis or Mr. Raibourn's testimony this morning, about pirating. This, I think, is the best modern-day pirating that we have got in our industry today, where these community antenna systems can pick up the station—whether it be a network or a local station, or anything else—can pick it up and then funnel it on down the line for their own profit. I think I would be just as entitled to take off the air—and I am close enough to do it—the Philadelphia programs and put them on my UHF station and play them for free, as these fellows are to take them and sell them down the line.

Senator BIBLE. Did you ever try it?

Mr. KOHN. No, sir; I haven't, because I don't believe in it.

Senator BIBLE. I am wondering if there are any lawsuits involving this community antenna problem?

Mr. KOHN. There is a petition that has just been put in before the Commission, as I understand it.

Senator BIBLE. That has not been determined as yet?

Mr. KOHN. To determine whether or not they are illegal, or they should be designated as a common carrier.

Mr. COX. Your rebroadcast of the Philadelphia signals would be a clear violation of the Communications Act, whereas, up to now, it has been a debated legal question as to whether their operation violates anyone's property rights?

Mr. KOHN. I think the application is synonymous, although it is spelled out in the case of a broadcaster and has not been spelled out here.

Senator BIBLE. I think it is for the courts to determine, and that is why I ask whether there has been any decision on the point.

Mr. KOHN. But the point that we would like to make here—and now we are getting to the application of all this that you have seen now—the point we are trying to make here is that all of this talk about whether the people will pay for their television or not is beautifully illustrated in our own State of Pennsylvania where there are at present 74,664 people paying for television, and not squawking about it—and you are going to hear a great deal the rest of this week about this idea of free television, and so forth.

We maintain that there are people now that are willing to pay for it. In my own apartment house I paid a hundred dollars for a guy to connect two wires—he already had the thing in—and $25 a year to get television, and never thought a second about it. We wanted television that bad.

Mr. COX. This is not, however, a payment on a per program basis.

Mr. KOHN. No; but they do not have the choice, either, that they would get on a program basis.

Senator BIBLE. How many people in Pennsylvania pay?

Mr. KOHN. 74,662, and by the estimates of the community antenna operators, themselves, they have a potential of 109,750.

Senator BIBLE. 75,000 people pay how much for community antenna per year, after installation, in Pennsylvania?

Mr. KOHN. I do not have the figures on that, Senator, but I understand there is to be a representative from Jerrold testify here later, and I can tell you that at least 95 percent of the operations in Pennsylvania were put in by Jerrold.

Mr. COX. There was previous testimony by the operators of one of these systems to the effect that their monthly service charges ran from $3.50 to $7.50, and the installation charge was from $100 to $165, I believe.

Mr. KOHN. It is quite expensive, I believe.

Senator BIBLE. Your point is if they can pay for this, they can pay for a subscription?

Mr. KOHN. My point is we don't know. We are trying to sit here and determine whether the people out there will pay for it or not, or whether they are going to rise up in arms if asked to pay for it.

Senator BIBLE. But you point to this as an example?

Mr. KOHN. This is an example of what is existing today—that people are paying for their television programing.

Senator BIBLE. I understand your point. Thank you.

Mr. KOHN. For the matter of the record, we have dropped in here now (referring to exhibit G–2, see p. 1152 below) the television coverage of Pennsylvania to show—in relation to these, if television does develop the way it should in Pennsylvania, in the whole State of Pennsylvania—that rather than just get on a line, on a cable, at those places, where if they go away for 6 months they are still going to pay for their television programs on that rate—it is a contract rate, as I understand it, on the community antenna system, and whether you watch television or not you pay for it; but if subscription TV were allowed to operate in all of these television stations shown here—particularly the UHF, and I think it should be done on a trial basis first—these people will have their own choice, and they can pick up and choose what they want as far as their channels are concerned

We know, for instance, that when we were operating, the community antenna people came to us and said "Do you want to install the equipment? It is expensive, but if you want to get on our cable you are going to have to pay us.' I said, "If you want to pick up our programs you are going to pay us," and I think if we had been on the air another 6 months we would probably have had one of these operators in court by now, determining whether or not it is right that they should be able to pick up these signals, at least without some kind of common carrier designation, or without paying the producer of the program.

Now, let us look at the coverage here (referring to exhibit G–3, see p. 1153 below). I want to show you a real example of local expression. These are all radio stations. This is how radio has developed in the State of Pennsylvania. We have excellent radio coverage in every city—even in cities smaller than 10,000 we have radio stations, and a great number of them—and in these towns we have theaters, and we feel that subscription TV in any town that can support two theaters—subscription TV can be supported, along with the local revenue that stations on the regular broadcast schedules will carry.

Mr. Cox. Can they do that and still support the two theaters?

Mr. KOHN. Not necessarily support the two theaters, but it may be a logical extension, rather than having two theaters, you will have theater in the home, yet; and I have never seen yet why the theater people do not recognize this as the ultimate in box office. Rather than fight it, they should be in here pitching for it as an opportunity, and even on a franchised basis.

Needless to say, we have 134 AM stations and 43 FM stations in Pennsylvania, doing an excellent service. Television is nothing more than a logical extension of our electronic medium. We have got sight now put with sound, and we feel that wherever possible in the United States the logical extension from radio to television should be made, and that maybe this pay TV is the answer to it.

Senator BIBLE. Well, now, right there at that point, you have developed this local expression. I think you have a lot of merit in what you say, but will the average listener in Allentown put a dollar in the meter to listen to a program of local expression?

Mr. KOHN. We don't propose, Senator, to charge for our local expressions. My company is more interested, say, in the 85 percent that we will be allowed to put on for our own community than we are in the 15 percent of pay TV, but the pay TV is the opportunity to get the 85 percent which is now silent.

Senator BIBLE. I am very glad to have you clear up that point, because I don't know that that was clear in the record.

Mr. KOHN. I am sorry I didn't make it earlier.

Mr. Cox. In other words, your position is that if subscription television were authorized to the extent of 15 percent of your station's time, that it would provide you with programs that would compete with the networks and would bring you in enough revenue so that, with local advertising revenues you could provide local programing on your station for the balance of your day's operation—is that it?

Mr. KOHN. That is correct, and I think we could be on many more hours a day. I think we could do the programs we did before with the limited budget on, now, an even larger budget, and have a better program to serve the community.

Senator BIBLE. What type of pay program would you put on?

Mr. KOHN. I have a full exhibit of each program schedule as we would propose to put it on.

Senator BIBLE. On a subscription basis?

Mr. KOHN. On exhibit H (see p. 1159 below).

Senator BIBLE. I would say you have done a very, very thorough job of presenting the case.

Mr. KOHN. I think it is the first time anybody has introduced an exhibit of how this will actually work out on an hour-by-hour basis on a television station; and this, after all, is the meat of the matter: What kind of programing is going to be done, what is the revenue that is going to be derived from it? Is it going to do what the proponents have said it is going to do, or that the opponents said it is going to do? Is it going to ruin all free television, and so forth?

Personally, we felt that this was necessary, to get down and analyze it on the basis of, let us say, that you have already authorized it, who is going to go ahead, and on what basis, tomorrow? This is the proposed schedule that WFMZ-TV would use.

Senator BIBLE. What do you pay for on your exhibit H, page 1?

Mr. KOHN. All of those that are blocked off, the blocked lines are pay-TV programs, subscription television programs; those that are blocked off with the black line there. At 1 o'clock in the afternoon, and 2 o'clock in the afternoon, is educational television—purely and simply educational television.

I must remark here that the Allentown-Bethlehem-Easton area, with 7 colleges and universities, and with the 3 cities' public school systems, and so forth, we have no educational allocation to that area. I feel that it would be incumbent upon any station there to substitute itself, at least in some measure, in taking over the responsibilities of an educational station if one had been allocated to that area.

Mr. COX. Would this programing, for which you are going to make a charge, be live based upon personnel from these colleges or would you propose to get filmed instructional materials for this?

Mr. KOHN. I suppose, Mr. Cox, that it would be done—I have seen quite a bit of the material produced by the Ann Arbor Film Center, which is interspersed—it is part live, it is part film, for illustrative purposes, and so forth. Mind you, if a great number of stations were doing this, that in no time at all you would have the best from these stations, which is happening already in educational stations, such as the Pittsburgh station is supplying one of their very best programs to Ann Arbor where, in turn, they turn it out to be used on educational stations throughout the country. I think this is the answer to educational television, this subscription-type tuition. We will call it tuition television, as far as educational television is concerned.

Senator BIBLE. Then on page 2 you get to something that is a little more my type. You have some college-type football games blocked in there, and professional football games—how do you propose handling that?

Mr. KOHN. That would necessarily have to be handled on a live basis. It is impossible to take a film without destroying the suspense of it. Those people that watch the game are the ones that watch the filmed game, too, to pick up an interest in it. But this would require, as was brought out this morning, a network. It requires a network to get college football.

Senator BIBLE. I appreciate that. If I am in Allentown and want to tune into your station, how much am I going to pay to see that college football game on the first Saturday in September at 2 o'clock?

Mr. KOHN. In the pages that follow we have reduced these to the individual charges, at various set installation figures.

Senator BIBLE. Well, could you indicate approximately—put 50 cents in the meter or what?

Mr. KOHN. We propose here a dollar for a college football game and for professional football and we based that, toward the end of our economic exhibit which follows this—and then we took everything and halved the charges, and we still found out that we could make a profit that scares you.

It is economically feasible, and that is why we think stations in all of the towns of 10,000 and over can be supported by this method. Now mind you, here we only have 19 percent of commercial pay TV out of a schedule starting at 12 o'clock noon.

Senator BIBLE. Come again with that statement. Would you repeat that?

Mr. KOHN. Only 19 percent of our programing is taken up with commercial subscription television in a week, and we have set this schedule from noon on. We would propose—if this were successful, we would propose, of course, to go on and match any other station and go on at 7 o'clock in the morning, so that that 19 percent would be even less than the 15 percent of other proposals that have been made here. Now there is 19 additional percent in here for educational television, but in those cities where there is an educational television station that would be taken out of there. I would hate to go on record as being charged, as a commercial operator, for those educational television hours.

To get to the summary, we have 15 hours per week of commercial subscription.

Senator BIBLE. What exhibit and page are you reading from now?

Mr. KOHN. Exhibit H, page 5.

Senator BIBLE. Thank you.

Mr. KOHN. This is a breakdown, in percentages and hours, of this weekly program schedule which we have just shown you here.

Maybe I should have pointed out in there that we do include such programs as our Allentown Symphony, our high-school football games—we heard too much about New York City today, and not enough about these towns that are really going to benefit. New York City already has the Metropolitan Opera that the people can go to see. We are concerned about the people that it costs a great deal of money to get on the train, or fly into New York, and see a Metropolitan opera. I think it should be the concern here—not the big cities but the smaller cities, at least at the outset, to bring these benefits of subscription television to them first, and you can only do that through the UHF stations. On exhibit H, page 5, we have a total of 15 hours of commercial subscription per week, or 19 percent; educational, we have 15 hours or 19 percent; so-called free—and I want to emphasize that I would never use that word "free" without putting quotation marks around it, because it is a misnomer to say that there is anything called free television today except in the loose sense of the word as we use it.

Senator BIBLE. What you are saying there is that you would operate your station for 30 hours of subscription TV per week; is that right?

Mr. KOHN. That is right.

Senator BIBLE. Fifteen commercial and 15 educational?

Mr. KOHN. That is correct. In cities that had their own educational station that would not hold true. They would do their own but we have none in our area. Now here is the answer to the $64 million question. Applying to this weekly program schedule, which we have just presented here, we have reduced it now, to what kind of income can be expected from just that few programs on subscription TV—and our top, remember, was $1 for football games, for sports, and our top was $2 for a Metropolitan opera coming into the community. For the Philadelphia Orchestra, the Allentown Symphony, $1; but here this is the thing that startled us, that there is such a potential in this pay TV, and just because there is I see no reason for anybody to be afraid of it. It just seems to me that the industry, instead of wobbling along, is going to find a cure here that all of a sudden is going to make it become a full-blown industry over a period of a decade, rather than perhaps slipping backward and never achieving that full potential.

I personally do not see that there is a bit of difference between subscription TV and advertising TV. That is one thing that I have never been able to draw a difference on, except that with this pay TV, it is the honest way of extracting the money from the public rather than the hidden way of extracting the money from the public. For instance, our people in Allentown, every time they buy a car, they are still paying $25 advertising expense on each one of those cars. They do not know it because it is not broken down for them when the dealer sells it to them, but they still are doing it. If you do not own a car you are paying for it anyhow on the television show.

Senator BIBLE. I drive a Mercury, and I have looked at Ed Sullivan's Sunday night shows long enough to know that he has a few dollars invested in my Mercury—or rather I have the investment in him. [Laughter.]

Now, how much is this going to cost the user in Allentown, Pa., who wants to look at 30 hours' worth of TV per week on a pay schedule?

Mr. KOHN. You have embarrassed me now, Senator, because that is the one thing that I should have figured out, and I haven't, but I will get it and make sure that you have it. I haven't reduced it to actually what the average family would have to come up with each week.

Senator BIBLE. You tell me if I want to look at the Saturday afternoon football game it will cost me $1 for 2 hours; correct?

Mr. KOHN. Yes. It depends on how many shows you watch a week.

Mr. COX. I suppose you would not expect any one family to watch all of these at a time?

Mr. KOHN. Maybe at the start, just like in the early days we watched television even though there was a snowstorm running across the picture. But I think it will boil down entirely to what is the program content of the shows, and the kind of reputation pay TV gets will be entirely based upon the word of mouth, and so forth, that will spread this thing very rapidly.

Senator BIBLE. How can you come up with any adequate study, or estimate, of the potential income unless you have some agreed percentage of the time which the people are going to be looking at this subscription TV?

Mr. KOHN. Well, all we can present here, Senator, is a breakdown of the types of programs and the general viewing habits of people at the present time, and whether or not they would pay to see something better than they are getting now.

That is my whole point. It has to be tried, and we should lose no time at all in trying this thing to see exactly whether or not this is one of the answers to getting a nationwide television system. If it isn't tried, we may be sitting here making decisions that will set the Nation back for all time as far as this wonderful communications system that we have.

I can show you how we arrived at this summary, the individual charges for classes—we would suggest a 50-cent tuition fee. As you see here (referring to exhibit I; see p. 1160 below), we have broken this down for the benefit of, we figure, 5,000 families for a community of 10,000 people, the immediate environs of that 10,000 being stretched out maybe to 17,000 or 15,000. We took the actual urban population here, but showing the potential of this medium, in the various brackets of installation, such as 5,000 families, 25,000, and on up to 200,000, which would be the potential of our own Allentown area, when we have a complete saturation, which may never be reached.

Mr. Cox. That is 200,000 television homes in a population of a half a million.

Mr. Kohn. Yes; at our present antenna height of 871 feet. That is the high estimate.

Now, we anticipate that a lot of people can quarrel as to how you make estimates, so we took a high estimate, we took an average estimate, and we took a low estimate, so that anybody, in his individual opinion, can pick any one of them.

I don't think anybody can go below the low estimate, and we prove in our summary of the income potential that—for instance, here is a high school football game. Even at the very lowest level estimate, if we have 200,000 families that are equipped to receive the game, you get $30,000 out of 1 game of high school football, with only 15 percent of the people tuned in. It is rather staggering when you figure that——

Mr. Cox. This is page 4 of exhibit I?

Mr. Kohn. Yes.

Senator Bible. What do you base the 15 percent on? That is where I am confused. Is that what the ratings show?

Mr. Kohn. Fifteen percent of the people that have sets that could pick it up—15 percent would tune into the game.

Senator Bible. A high-school football game?

Mr. Kohn. Yes. Now, high-school football will rate above professional or college.

Senator Bible. Is that statistically correct?

Mr. Kohn. Yes; in our community, high-school football and high-school basketball has for years outdrawn college and professional.

Senator Bible. But you base these ratings you have in your exhibit upon your own experience with Allentown?

Mr. Kohn. Yes; and nationally. In this exhibit, Senator, that we we presented before the Commission, we did a very exhaustive study on comparative ratings of existing shows on the air, such as feature film, and so forth, and from that we deduced, and I have taken those figures—and I think that scientifically no one can quarrel with the figures as far as the ratings are concerned. The only thing they can quarrel with is, Will 15 percent of the people tune into it?

We maintain that if they don't, we are wasting a lot of time here, but we ought to find out by allowing this to be used where it will have a double impact. You will get the facts on whether it should be used on a nationwide basis, and at the same time you will breathe a lot of hope into the UHF stations at the present time.

Just the mere fact that anybody comes out in favor of trying this, such as the committee here, or the FCC authorizes it, is immediately going to reestablish a tremendous amount of hope throughout all of the United States for those who have been in the UHF operation. It is worth holding on to your CP to see what happens.

Mr. Cox. Not all of this revenue you project is going to come to the station operator; is it?

Mr. KOHN. No; it is not, but if you will notice these figures on the summary, when you get to a point of $10 million, there is enough in that pot to divide up among all of the fingers that will want to get into it, including the producers of the films, the baseball people, the franchise holder, and so forth.

Mr. COX. Now, is it your understanding that you, as a station operator, would, or could, in such an operation get more than your straight-time charge for the period on which these programs are broadcast?

Mr. KOHN. There isn't going to be any franchise holder that is going to try to pay me a one-time rate. If he is going into a contract with our station, it will be on equality of the importance of each medium to each other. In other words, without us they can't carry it, and it would be foolish to go into this on the idea that you are only going to get your 1-time rate card and let 99 percent of the profits go out to people that just furnish it to you. That would be a terrible inequity, and it would hurt the whole television industry.

Mr. COX. They could put it over all of these cable systems if they have a spare circuit; couldn't they?

Mr. KOHN. He certainly can, and he can put a charge on top of a charge.

Mr. COX. They will pay their $3.50, or whatever it is, for the service, and then the $1 for the football game?

Mr. KOHN. Yes.

Mr. COX. They are already paying the $3.50 for the service, and if they want the football game they would pay additional?

Mr. KOHN. Yes. Mind you, these people are already paying $3.50 a month, and if you get just $3.50 a month out of this 19 percent of programing in a weekly schedule here you have got WFMZ stockholders very happy—if we were in operation on that basis.

Mr. COX. Do you think that you would get enough revenue net to the station itself to permit you, with what additional local advertising revenue you got, to carry on a satisfactory scale of operation here in terms of local expression?

Mr. KOHN. Let's just say we only reach half our potential, Mr. Cox, and there, even on the low estimate, the yearly income from that 19 percent of commercial TV is $5,330,000. Never in our wildest imagination did we think we would draw that from a hundred-percent commercial schedule and advertising income. We figured that we had a potential of about a million dollars a year in the Allentown area, as far as reaching a full potential is concerned.

Here let's knock the games down to 10 cents apiece and we are still on an equity of advertising-produced revenue, if that many people watch it. The lower the price, the more people are going to watch it, and the more people are going to want to have their sets installed with these devices.

Mr. COX. Now, of course, that cost you haven't reflected here—the cost of actual installation of a decoder?

Mr. KOHN. We are only concerned with the broadcast. However, we did reflect decoder costs and everything in our application that we put in to the FCC a year ago.

Senator BIBLE. Did you reflect $45—does that seem to be fairly agreed in the industry, $30 to $50?

Mr. KOHN. Yes; we put it again on the basis of three different scales, and then showed how it came out. We showed it at $25, $50, and $75, I believe. A high, medium, and low estimate.

Again, take your pick, and you are bound to fall somewhere within that range. Everybody's opinion is bound to fall within that range. I don't see any reason at all why it should not be tried. I don't see anything here that is contrary to the Constitution or to the public interest or anything. It is up to the people. They are going to decide whether it is going to fail, whether they are going to do it, or whether they are not going to do it.

Senator BIBLE. I don't think anybody has been accused of violating the Constitution so far.

Mr. COX. Do you have assurance from Zenith that if such an experimental operation were authorized, decoders would be made available for a market of the size of Allentown for that purpose?

Mr. KOHN. I certainly hope I am not here under false pretenses, that it isn't ready to go into operation.

Mr. COX. I understand that. The next question was going to be how long would it take, in your opinion, to get such a program going on a substantial basis in a market the size of Allentown-Easton?

Mr. KOHN. I understand there are going to be Zenith representatives. I know as far as our local installations that we can put them in, or the franchise holder, whoever has them, but I am sure that on the basis of just the publicity—I was going to say the notoriety—of this application that we put in that our town is probably more pay TV conscious than any city presently in the United States.

Senator BIBLE. Any further questions?

Thank you very much, Mr. Kohn, for your very able presentation. I think your exhibits have been most helpful and will be most helpful to this committee.

We will stand in recess until 10 o'clock tomorrow morning.

(Whereupon, at 4:35 p. m., the committee adjourned, to reconvene at 10 a. m., Tuesday, April 24, 1956.)

(Mr. Kohn's exhibits are as follows:)

EXHIBIT A

Documentary exhibit of WFMZ-TV's community interest and public service conscience as indicated by just one daily (Monday through Friday) program and during only the 4-month period WFMZ-TV was on the air

WFMZ-TV "7–9 SHOW" EDUCATIONAL AND ENTERTAINMENT FEATURES

(Daily (Monday-Friday) 7–9 p. m., local live—December 1954–April 1955)

Feature

1. Lehigh County Medical Society (15 minutes per):
   - (*a*) Dr. Eddinger—The County Health Unit
   - (*b*) Dr. Eddinger—How a CHU Operates
   - (*c*) Dr. Gabriel—Cancer of the Stomach
   - (*d*) Dr. Gabriel—Treatment of Stomach Cancer
   - (*e*) Dr. Hyman—Stomach Ulcers
   - (*f*) Dr. Marger—Diseases of the Heart
   - (*g*) Dr. Marger—Treatment of Heart Diseases
   - (*h*) Dr. Cunin—The Ear and How It Works
   - (*i*) Dr. Cunin—The Ear (continued)
   - (*j*) Dr. Lachman—Diseases of the Eye
   - (*k*) Dr. Lachman—Treatment of Eye Diseases

WFMZ-TV "7-9 SHOW" EDUCATIONAL AND ENTERTAINMENT FEATURES—Continued

Feature

2. Red Feather Agency (25 minutes per):
   (*a*) YMCA
   (*b*) Boy Scouts
   (*c*) YWCA
   (*d*) Public Health Nursing Association
   (*e*) Jewish Community Center
   (*f*) Child Guidance Clinic
   (*g*) Girl Scouts
   (*h*) Girls Club.
   (*i*) Wiley House
   (*j*) Family Service
   (*k*) Osteopathic Hospital
   (*l*) Lehigh Community Council
   (*m*) Lehigh Community Chest
   (*n*) Boys Club
3. Lehigh Valley Industry (25 minutes per):
   (*a*) Vale Chemical Co.
   (*b*) Bethlehem Furniture Manufacturing Co.
   (*c*) Reichard's Fertilizer Co.
   (*d*) Lehigh Portland Cement Association
   (*e*) J. M. Glowatsky Trucking
   (*f*) Lehigh Structural Steel
   (*g*) Lehigh Valley Gas Division
   (*h*) Bell Telephone Co.
   (*i*) Pennsylvania Power & Light Co.
   (*j*) Palmerton (N. J.) Zinco Co.
   (*k*) Palmerton Cable Co.
   (*l*) Slatington Kern Antenna System
   (*m*) Bid Red Slate Co.
   (*n*) Clayton Dress Manufacturing Co.
   (*o*) A & B Meats—"Selecting a Grand Champion Steer"
4. Other campaigns (20 minutes per):
   (*a*) Lehigh Crippled Children's Society (Easter Seals)
   (*b*) Lehigh Chapter American Red Cross
   (*c*) American Heart Association Heart Fund
   (*d*) March of Dimes Drive
   (*e*) Lehigh Valley Safety Council
   (*f*) Air Force Recruitment Demonstration
5. Sports features (30 minutes per):
   (*a*) Show dogs (5)
   (*b*) Archery demonstrations (12)
   (*c*) Studio rifle shoots (16)
   (*d*) Boys Club boxing (6)
   (*e*) Hunting and fishing talks (4)
   (*f*) Table tennis tourneys (3)
   (*g*) College fencing demonstrations (3)
   (*h*) College and high school wrestling demonstrations (7)
   (*i*) Lehigh Valley Chess Club (1)
   (*j*) High school and collegt basketball demonstrations (6)
   (*k*) Bowling demonstrations (2)
   (*l*) In-studio meeting of Little League Baseball (1)
   (*m*) Bicycle racing demonstration (1)
   (*n*) Ice Vogues Stars, interview (1)
   (*o*) Model plane demonstration (1)
   (*p*) Model train races—YMCA—Y's Men's Association
6. Other weekly features (10 minutes per):
   (*a*) Book reviews (9)
   (*b*) Know Your Civil Servants:
      (1) Mayor Diefenderfer (Allentown)
      (2) Mayor Morse (Easton)
      (3) Lieutenant Thomas (police department)
      (4) Chief Reilly (police department)
      (5) Burgess of Palmerton
      (6) Russell Bender, fire chief

WFMZ-TV "7-9 SHOW" EDUCATIONAL AND ENTERTAINMENT FEATURES—Continued

6. Other weekly features (10 minutes per)—Continued
   (b) Know Your Civil Servants—Continued
      (7) Walter Flores, fire chief
      (8) Lieutenant Geisinger, traffic control
   (c) Reading Is Fun—9 programs (30 minutes per) presenting panels of first through ninth grade schoolchildren in cooperation with the Allentown Public Library and the American Association of University Women.
7. Travel features (15 minutes per):
   (a) John Zamborsky—Allentown's Good Will Ambassador to Greece
   (b) Australians John Burke and Colin Smith, visitors
   (c) Fred Coleman—Travel abroad
   (d) Judge Henninger—My European trip
   (e) Andrew Gih—Chinese Christian evangelist
   (f) Prof. Leon Godshall—Student travel abroad
   (g) Mrs. Jenson—How a travel bureau operates
   (h) Mrs. Roth—Travel to South America
   (i) Fred Blume—TWA transportation agent
   (j) Alfred Wenz—How AAA operates
8. Hobby features (15 minutes per):
   (a) Mrs. William Guth—Doll collecting
   (b) Moulton Franz—Raising champagne rabbits
   (c) Chas. Renfrew—Hunting uranium
   (d) Bernie Alper—How to write a salable story
   (e) Jack Heinz—How to write a song and publish it
   (f) Doris Blanchard—Bell collecting and playing same
   (g) Mrs. Helen Kickline—Doll collecting
   (h) Frank Saurman—Typewriters, old and new
   (i) Rev. Norman Cressman—Stamps as a hobby
   (j) Willard Otto—Raising chinchillas
   (k) Wendling Bros.—Old cars as a hobby
   (l) William Behler—Dry brush painting
9. Occupations (20 minutes per):
   (a) John Heyl, architect
   (b) John Klaus, modern burglar alarm
   (c) Auctioneers, Quakertown Farmers' Market
   (d) Don Dix, business manager, minor league ball club
   (e) Mr. Beveridge, gem cutting
   (f) Bob Smith, stockbroker
   (g) Rev. Arthur Sherman, ministerial association
   (h) George Reinert, banker
   (i) Alberta Moffa, theater owner
   (j) Dr. John Weinlick, history of Moravian Church
   (k) Abe Benioff, furrier
   (l) Joy Manger, window dressing
   (m) James Musselman, high school art teacher
   (n) Jack Berliant, TV equipment dealer
   (o) Bob Dilient, high school driver training teacher
10. Special events:

	Minutes
(a) Special Easter service—Choir and minister	25
(b) St. Catherine of Sienna RC Boys Choir—50 voices	25
(c) Bethlehem Civic Little Theater promotion	15
(d) Special appearance of Sloan Simpson and Ted Lawrence	15
(e) Mrs. American Lehigh Valley winner and finalists	10
(f) Guest appearance of Gene Autry and Annie Oakley	20
(g) Easter seals interview with Ted Berger	10
(h) History of Slatington	8
(i) Emmaus Magic Show promotion	10
(j) Gay Nineties promotion for Sears, Roebuck	10
(k) Art contest sponsored by Pennsylvania Power & Light	15
(l) Coplay Rotary Club	10
(m) JCC Voice of Democracy winners and awards	30
(n) Flag raising at Iwo Jima, film and interview	10
(o) Brotherhood Week observance, JCC	15

LEHIGH VALLEY MUSICAL ORGANIZATIONS AND TALENT APPEARING ON WFMZ "7-9 SHOW" DURING PERIOD DECEMBER 1954–APRIL 1955

1. John Oberle—Organ
2. Joe Simon—Accordion
3. Earl Keller Orchestra—Hillbilly
4. Tune Dusters Band—Hillbilly
5. All Girl Orchestra—Pop
6. Harmony Kings Orchestra—Polka
7. Diane Beitler—Vocal
8. Frank Sevak Trio
9. Three Chords and Three Coeds—Vocal
10. Harrison Morton Junior High School Band
11. Miles Batt—Vocal
12. Jerry Bender Orchestra—Pop
13. Allentown String Band
14. Richard Tarnow—Accordion
15. Lindy Calvert—Vocal
16. Frances Salvagio—Vocal
17. Phyllis Litzenberger—Organ
18. Martha Hill—Vocal
19. Shirley Dietz—Irish harp
20. Eleanor Keim Mengal—Marimba
21. Polka Teens Band
22. Judith Ann Heyer—Vocal
23. Lydia Kleintop—Tap dancer
24. Karl Braun—Comedian
25. Kal's Kids—Pantomime
26. Delores Wasilowsky—Acrobatic
27. Ron Scheirer—Vocal
28. Margaret Lilly—Organ
29. Pat Lynch—Vocal
30. Robert Vogel—Vocal
31. Meltzer Western Band
32. Mrs. Lawrence Coons—Trick drawing
33. Phyllis Gruenstein—Vocal
34. Fenstermacher Rube Band
35. Lloyd Anderson—Organ
36. Pat Floyd—Vocal
37. Betty Pollitt—Vocal
38. Ruth Wren—Impressionist
39. Woodlawners—Pantomime

LEHIGH VALLEY MUSICAL ORGANIZATIONS AND TALENT APPEARING ON WFMZ "7-9 SHOW" DURING PERIOD DECEMBER 1954–APRIL 1955—Continued

40. Carl Schreider—Vocal
41. Kitty Webber—Vocal and organ
42. Dorothea Costa—Vocal

TELEVISION INQUIRY

(Subscription TV)

TUESDAY, APRIL 24, 1956

UNITED STATES SENATE,
COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE,
Washington, D. C.

The committee met, pursuant to adjournment, at 10 a. m., in room G-16, the Capitol, Hon. John O. Pastore presiding.

Present: Senators Pastore and Schoeppel.

Senator PASTORE. If we are all ready, we will commence these hearings.

To begin with, the distinguished former chairman of this committee, and the present Governor of Colorado, Edwin C. Johnson, had intended to appear and offer a statement to the committee on subscription television. Because of circumstances beyond his control he is unable to appear in person but has forwarded his statement as he prepared it, and as he intended to submit it to this committee.

Governor Johnson's leadership and interest in the field of communications, particularly broadcasting, are well known, and the committee is most fortunate indeed to have the benefit of his views.

Without objection, Governor Johnson's statement will be made a part of the record.

The chairman of the committee, Senator Warren G. Magnuson, had intended to read a general summary at this time, but unfortunately he is detained and unable to be present, and Mr. Cox will read the statement, or the summary, in his stead.

Mr. COX. Governor Johnson's statement was motivated by the fact that the present television system falls far short of filling the potential of serving the public which it has the technical ability to accomplish—a failure prominent in Colorado and the Western States.

He believes it imperative that the Nation shall have: First, an equitable and fair distribution of television facilities; second, a competitive system that will avoid monopolies in the industry, and among the big advertisers that use it; third, a system of television that will advance baseball, a field in which he has particular interest, instead of killing it; fourth, a system of television which would provide the public with many educational and high quality television programs which advertising is unable or unwilling to bring, for economic or other reasons; and, finally, a system of television which by virtue of competition may eliminate advertising excesses and tend to improve the quality of programs.

He expresses concern about the lack of local competitive stations. Only 275 communities now have local television stations, and 60 percent of these cities have only one local television station.

In Colorado, he points out, 4 of 23 cities allocated channels have local television stations; in Montana only 4 of the 26 cities allocated TV channels have local stations; in Wyoming, only 1 of 23; in Idaho, 4 of 21; in Utah, 1 of 11; in Arizona, 4 of 22. The impact of this is illustrated in connection with the various proposed amendments to the Communications Act which would make television more freely available for use by political candidates. He points out that these are worthy objectives but of little practical significance in the States in the Rocky Mountain area because of the limited number of local television stations available for such purposes.

Under the present system of advertising support, the people of Colorado pay the same price for a bar of soap or a tube of toothpaste as the people elsewhere in the Nation, but they are receiving very little television service in return. National advertisers tend to broadcast programs into an average of only 60 to 65 top markets. Denver is the only city in Colorado which is a "must buy" market on CBS or NBC, while Wyoming, Nevada, Montana, Arizona, and New Mexico do not have a single "must buy" market on any of the national network lists. With the limited number of stations now available, the preemptive use of television time by large advertisers tends to make big business bigger and small business smaller, all to the detriment of the development of local community economics and forms of expression.

The inadequate number of competitive television stations in markets under present circumstances leaves the small-business man without a television outlet for his advertising. Governor Johnson does not criticize the national advertisers' use of television, but emphasize the necessity for outlets available on a local level for the local advertisers, the local charitable, religious, and educational organizations.

In discussing the allocations plan and the various suggestions concerning its change, Governor Johnson states that whatever the allocations plan that may be adopted, it will have meaning to the public only if the stations made technically possible on paper can actually be brought to life. The provision of additional sources of economic support carries far more hope than a mere technical change, in his view. He does not dispute the impact certain allocation changes would have in particular markets now without adequate competitive facilities.

However, he is concerned as to how television service will get to small communities in the Rocky Mountain area, and similar areas in the country, where the problem is not UHF or VHF but, rather, the need for a new source of revenue and high quality programs to supplement limited advertising support, and to make up for lack of network programing. Something supplemental is needed, he says, because even if all of the markets were either UHF or VHF, according to CBS, advertising could support less than 600 stations in 217 markets in the foreseeable future.

Governor Johnson believes, therefore, that subscription television is the only source of additional revenue and high quality programs available which has the potential of increasing the limited amount of service now in existence. He was favorably impressed by Commissioner Lee's proposal in Look magazine, wherein it was suggested that subscription television programs be limited to 10 or 15 percent of a station's time on the air. Thus 85 percent of its time would be available to the public for other purposes—for instance, for local advertisers, who now do not have an opportunity to use this medium.

More new stations would give independent producers of programs outlets for their products. New stations and competitive sources of programs would substantially reduce the possibility of monopolies and highly concentrated power in the television industry, and at the same time offer the public greater program choices than are now available.

It appears to Governor Johnson that two basic types of television stations will ultimately develop: First, the network affiliate, which will be primarily a vehicle for the big national advertiser, and carry few, if any, subscription programs; second, the hometown station in a small community which would devote a relatively small portion of its time to subscription service, and the balance to local commercial, religious, charitable, and educational programs.

From a practical standpoint, in the opinion of Governor Johnson, the needs of the network and national advertiser are substantially satisfied under the present system, and there is little indication that they will go outside the top 100 markets. In addition, it appears that in the markets where there are a limited number of stations, the networks' right to preempt time leaves little opportunity for local programs.

A television system which provides both advertising and subscription programs would give the public the opportunity freely to choose between subscription programs and the advertising programs, and quality would prevail.

Both FCC Chairman McConnaughey and FTC Commissioner Mason commented recently on overcommercialization and excesses in advertising. While he was a member of Congress, Governor Johnson says, he always stressed the fact that it was impossible to legislate good taste or sound judgment in television programs or advertising copy, but that this could best be solved by competition—in this case, competition between subscription television and present advertising programs, which he thinks would tend to eliminate excesses in advertising or low quality television programing.

Turning to the sports field, Governor Johnson emphasizes the impact television is having on gate attendance. Major league attendance has steadily declined, and many owners and managers have stated they cannot survive on what sponsors are paying for televising major league games in view of the resulting loss of gate receipts. Milwaukee, Pittsburgh, and Kansas City have refused to permit their games to be televised.

In the minor leagues, the situation is worse. The losses in the minor leagues have been so great and have reached such proportions, according to Governor Johnson, that something must be done if baseball is to survive outside the major leagues. In 1950 there were over 58 minor leagues to entertain 35 million fans. In 1955 there were only 33 leagues, and attendance had fallen off 46 percent since 1950. In boxing, the heavyweight title fights have not been seen on television in 5 years. The NCAA has found it necessary strictly to control the televising of college football because of the effect it has had on gate attendance.

In connection with many sporting events, Governor Johnson believes that the American public will be confronted with two choices: Either to pay for the viewing of many of the major sports events through subscription television, or, on the other hand, to go without the convenience of seeing such events at home.

In conclusion, Governor Johnson states that it is his opinion that the FCC has all legal authority needed to authorize subscription television now, and recommends that this committee could serve a useful purpose by informing the FCC that the financial distress of the television industry and the inadequacy in terms of a competitive national system make it imperative for the Commission to act, and to act immediately.

The Government should be the last agency to attempt to prevent the television industry from taking the new product of subscription television to the market place to compete for a share of the American public's entertainment budget. His views are given after careful consideration of all factors weighed by many years of experience he has had in this field.

(Governor Johnson's full statement is a follows:)

Statement of Gov. Edwin C. Johnson, of Colorado

My name is Edwin C. Johnson, Governor of Colorado.

It is with many fond memories that I appear before this committee upon which I was once honored to serve as a member and as chairman. I hold all of my former colleagues in the fondest memory. I hope you may forgive me for expressing some views I hold with respect to TV for your consideration. While serving on this committee, I found no single problem more engrossing or challenging than the development of a sound nationwide competitive television system because of my firm conviction that television has the potential of making a greater contribution to the way we live than any other invention of modern times. My appearance here today has been motivated by the fact that our present television system falls far short of fulfilling the potential of serving the public which it has the technical ability to accomplish—a failure which is particularly pronounced in Colorado and other Western States. At least that is the excuse I offer for imposing on your time and patience.

Moreover, as Governor of my beloved State of Colorado, I am vitally concerned in establishing television as a medium of local expression in her larger domain which, under present circumstances, is limited to four communities.

Beyond my official responsibilities, I have long had a personal interest in the development of broadcasting and television by virtue of my former service on this committee. I believe, as I am sure every member of this committee does, that it is imperative that this Nation shall have:

1. An equitable and fair distribution of television facilities, and
2. A competitive system that will avoid monopolies in the industry and among the big advertisers that use it.

An avocation very close to my heart has been the national pastime of baseball. For a number of years I have acted as the nonsalaried president of the Western Baseball League. Therefore, if I may inject this purely personal note, I am also vitally interested in seeing that television advance this great national sport instead of killing it.

Finally, I am interested in seeing that the public has available many educational and high quality programs which advertising is unable or unwilling to bring to them for economic or other reasons. There is obviously a burning desire on the part of the public for many types of programs not now available. If such programs can be made available to the public on a nonadvertising basis, they will not only serve to fulfill a public need, but by virtue of their competition will tend to improve the quality of advertising programs and to eliminate many of the advertising excesses which now exist.

The Communications Act and the Commission's allocation plan contemplate television service, so far as possible, to all people of the United States under circumstances which would provide the greatest number of competitive services to the largest possible number of communities. It is readily apparent that our present television system falls far short of these objectives. Of the 1,238 communities to which the Commission allocated television channels, only 275 now have local television stations and there is little prospect at the present time that this number will be increased greatly under our present system of dependence on advertising support. Less than 25 percent of the 1,882 commercial channels allocated by the Commission are now in use. As compared to over 2,000 radio stations, we now have only 440 television stations. There is little local television competition in even the limited 275 cities which do have television stations since in over 60 percent of these 275 cities, there is only 1 local television station.

In the Rocky Mountain area, conditions are even worse than these nationwide figures indicate. Thus, in my own State of Colorado, only 4 of the 23 cities allocated television channels have local television stations, and of the 36 channels allocated to Colorado only 8 are in use. Colorado's sister States in the Rocky Mountain area have a similar lack of television service. Thus, only 4 of the 26 cities in Montana allocated television channels have any local television stations; in Wyoming, only 1 of 23 allocated cities; in Idaho, only 4 of 21 allocated cities; in Utah, only 1 of 11 allocated cities; in Arizona, only 4 of 22 allocated cities; in New Mexico, only 2 of 25 allocated cities; in Oklahoma, only 6 of 38 allocated cities; and in Texas, only 23 of 115 allocated cities.

Senator Pastore, for whom I have great affection and respect, has voiced a legitimate complaint that, while the people in Rhode Island are blanketed with service and commercials from Boston and the people of Connecticut by the seven New York City stations, they have very little opportunity to receive any local programs or the commercials of local concerns. However, the people in our Western States are not even as fortunate as the Senator's constituents, since they are without outlets for local expression and receive very little service and practically no choice of service from outside sources. Parenthetically, I might further add that the various proposed amendments of section 315 of the act to permit greater latitude in providing free television time for political candidates, while worthy in their objectives of providing information to the public concerning candidates and issues of the day, are of little practical significance in the States of the Rocky Mountain area. As an illustration, in Colorado only four communities have local television stations which could be used for this purpose.

In such States as Wyoming and Utah, political candidates could reach the voters of only one city in their State over existing television facilities.

Under present circumstances, the vast majority of communities in Colorado and the other Rocky Mountain States do not have television service available for local expression by government, advertisers, charities, education and sports. While a member of this committee, I stated, "with the technical means available, the huge task confronting the television industry was to actually bring local television service of excellent and even superior quality to the farms, country towns and smaller communities." Any television system which does otherwise is clearly divisive and discriminatory against large numbers of people.

As an illustration, under the present system of advertising support, the people of Colorado pay the same price for a bar of soap or a tube of toothpaste as the people elsewhere in the Nation, but they are receiving very little television service in return. In effect, therefore, many people in Colorado and other Rocky Mountain States without television service are subsidizing the television programs received by the public in other areas since their purchases of nationally advertised products help support these programs.

Furthermore, the national advertisers tend to broadcast the programs which they supply to the public "free" in an average of only 60 to 65 top markets. In this connection, Denver is the only city in Colorado which is a "must buy" market on either CBS's or NBC's "must buy" list. Even then, we are relatively better off than some of our sister States, since Wyoming, Montana, Nevada, Arizona, and New Mexico do not have even one "must buy" market on any national network's list and many national advertisers tend to ignore these States when given the option to do so.

With the limited number of stations now available, the preemptive use by large advertisers of television time tends to make big business bigger and small business smaller, all to the detriment of the development of local community economies and expression. As already noted by Mr. Moore in this proceedings, fewer than 20 large national advertisers contribute over 50 percent of the national network revenues. The inadequate number of competitive stations in markets under present circumstances leaves the small-business man without any television outlet for his advertisements. Under our system of distribution where advertising is such an important factor, this monopoly of limited television time by a handful of national advertisers is a very fertile ground for the growth of monopolies and the concentration of tremendous power in the hands of a few, not only in the television industry, but in all the large industries that advertise over television. I do not mean to imply any criticism of national advertisers using television. I merely wish to emphasize that if we are to give small business equal opportunity to utilize television in the distribution of its products, more stations in more communities must be made available.

In focusing our attention upon how we may increase the amount of television service and the number of communities having such service, there appears to be almost universal agreement that under our present system of advertising television, the number of stations and the number of television communities that this Nation can have are limited to the number that national networks and their advertisers can use or support. Under existing circumstances, nonnetwork stations have been unable to survive except in the top 3 or 4 markets.

One of the most optimistic estimates of television's future under a system of advertising support has recently been made by CBS which has estimated that no more than 588 stations in 217 markets can be supported by advertising in the foreseeable future. There is a serious question at the present time whether or not even this gloomy projection of television's future by CBS is not in fact overly optimistic in view of the fact that of the limited number of 440 television stations now operating in 275 communities, approximately 50 percent of the stations are losing money and the continued operation of many of them is in serious doubt.

Over the past several years this committee and the Federal Communications Commission have devoted a substantial amount of time and effort in ferreting out technical defects in the present allocation plan. While it was my belief at the time the Commission adopted a policy of intermixture of UHF and VHF that such intermixture would create needless problems, a great deal of water has gone over the dam since I expressed that opinion. Therefore, I have not come here to vindicate by hindsight the judgment which I expressed at the time the policy of intermixture was adopted.

I believe that under the existing situation, it is far more relevant to emphasize that so long as economic support of television is limited to advertising, mere technical changes will not substantially increase the amount of television service available to the public or the number of communities which will have television service. Since our ultimate object is to establish as many television stations as possible in as many markets as possible, mere technical changes in the allocation plan would only be quarter measures. Witness after witness has come before this committee and stated that their greatest problem was an inadequate source of high-quality programs and revenue. Under this circumstance, we will be deluding ourselves and the public if we publish an allocation plan which provides 3 or 4 times the number of stations and the number of television cities than will ever be used. As CBS has so forcibly brought out, even if there were no spectrum limitations and all television stations were either VHF or UHF, advertising could support less than 600 stations in 217 markets in the foreseeable future.

It is obviously a vain and empty act to provide for several thousand television stations in a "paper" allocation plan if the economic facts of life show that only several hundred can be supported by advertising. Whatever the allocation plan, it will have meaning and content to the public only if the stations made technically possible on paper by some rule of the Commission are brought to life. The provision of additional sources of economic support carries far more hope that the amount of television service possible under the allocation plan will become a reality than any mere technical change.

It is of course possible that in some markets technical allocation changes might make possible an additional station. This undoubtedly would have a practical effect only in a few of the larger markets where the networks can and will support more stations than now operate. In view of the limited needs of national network advertisers, this effect would apparently be limited to a relatively few stations in the first 60 to 100 markets in the Nation. However, in areas such as the Rocky Mountain States, in which few of the top 100 markets exist, such changes in the allocation plan would be of little, if any, help in increasing television service. The problem of these small communities in the western area is not so much whether they have VHF or UHF channels allocated, but rather, the need of a source of high-quality programs and a new source of revenue to supplement limited advertising support.

I believe subscription television is the only source of additional revenue and high-quality programs proposed which has the potential of increasing the limited amount of service now available to the public. If successful, subscription television would add a new source of local revenue which, together with local advertising, would make it possible for new television stations to be established in many smaller communities in spite of the lack of interest of the networks and the large national advertisers. In this respect, I was favorably impressed by Commissioner Lee's recent article in Look magazine in which he proposed the authorization of subscription television under circumstances which would limit the time devoted to subscription programs to 10 or 15 percent of a station's time on the air. Such a practical limitation would leave 85 percent or more of the programs broadcast by a station available free to the public and at the same time give opportunities to many local advertisers who now have no opportunity whatsoever to utilize television. Certainly, the public would be better off having 85 percent of their programs broadcast free with 15 percent subscription than to have no television service at all. It would appear to be commonsense, as well as an integral part of the American tradition of freedom of the market place, to at least give the public the opportunity to choose between paying for approximately 15 percent of their programs and having no television service at all.

The success of community antenna systems for which the public directly pays indicates a willingness upon their part to directly help pay the freight of television service. Thus, in my own State, the public in 8 cities are paying for community service and 4 more cities are planning such service. Several of these Colorado cities, however, must rely upon programs coming from stations out of the State. As beneficial as such community antenna service is, it gives these communities no outlet for local expression which I am certain they would be just as willing to help support as they are to pay for national and out-of-State programs in which they have no direct personal interest.

If, as I believe, the American public would be willing to devote part of their entertainment budget for television service which would not otherwise be available, it is clear that practically every major problem which has been discussed before this committee in the last few months would be eliminated.

The additional sources of revenue which subscription television would provide would mean more television stations in more potential television communities. It would alleviate the problem of those stations that are now unable to obtain network affiliations, since subscription television would supply a source of economic support and high-quality programs which would make it possible for them to compete with network programs and stations.

The new stations which subscription television would make possible would increase the demand for program sources independent of the networks. In this respect, many of the problems discussed by Mr. Moore in this hearing would be solved without the need for artificial Government interference. While I agree with Mr. Moore that the monopolization of time on the existing limited number of television stations by the networks tends to restrict competition from independent program sources, I believe the cure may more properly be the making possible of more television stations by the authorization of subscription television than by new and additional Government regulation of the networks. New and additional stations will give the independent producers of programs outlets for their product, which would appear to be far more important than a mere attempt to split up the limited amount of time on existing television stations between independent program producers and the networks.

By making possible new stations and new competitive sources of programs, subscription television would substantially reduce the possibility of monopolies and highly concentrated power in the television industry and other business and social organizations that now preempt it. The new stations would not only have time for subscription programs, but would devote the major portion of their time to free programs supported by local advertisers. Furthermore, the new and additional stations which subscription television would make possible would give the public a greater program choice and would provide more outlets for divergent viewpoints than is presently possible.

Television's leading competitors in the communications field, such as newspapers and magazines, all receive economic support both from the advertiser and from the subscriber. If we provide television with this same opportunity to obtain economic support directly from the public, as well as from advertisers, it appears to me that two basic types of television stations will ultimately develop in this country. First, there will be the network affiliate which will be primarily a vehicle for the big national advertisers and would carry few, if any, subscription programs because of conflicting time requirements. On the other hand, there will be hometown stations in the same and many new small communities which would devote a relatively small portion of their time to presenting subscription programs and the balance to serving local commercial, Government, charitable, religious, and educational programs on the present basis.

From a practical viewpoint, the needs of the networks and the national advertisers are substantially satisfied under the present system since their needs and requirements do not extend much beyond the top 100 markets. However, there is a great need for hometown stations in many communities in which the networks and the national advertisers have little, if any, interest. Furthermore, even in the larger communities having network stations, the time of the limited number of stations is so preempted by national network programs and national advertisers that there is little opportunity for local programs or local advertisers to use the medium. The record in this proceeding makes clear that it is the need for outlets for local expression and small-business men in both large and small communities that our present system fails to serve. The social and political significance of this failure is clearly something which cannot be ignored.

A television system which provided both advertising and subscription programs would give the public the opportunity to freely choose between high-quality advertising-free subscription programs and advertising programs. The competition which would thus exist for the public's attention would undoubtedly tend to improve the quality of advertising programs and make both the stations and the advertisers much more careful of excessive advertising and other advertising abuses. In this connection, I was interested to note that the Chairman of the Federal Communications Commission recently stated that "the trend in these changing times seems to be toward overcommercialization to the prejudice of public service." The criticism recently directed to television advertising abuses by Mr. Lowell Mason of the Federal Trade Commission, a long time very dear friend and devoted public servant, also emphasizes the problem in this connection. However, with the expense of television operation being what it is and with little competition, it is obviously difficult to correct these abuses under present circumstances as pressure upon the television stations for any kind of economic support is apparently too great to permit them to exercise free judgment in selecting or refusing the commercial advertising copy they carry.

Through the many years in which it was my privilege and delight to serve in Congress, I consistently took the position that it is almost impossible to legislate good taste or sound judgment in connection with the selection of television programs or advertising copy and that this problem could best be solved by a competitive system which would give the public the choice of ignoring those stations which abused their privileges. In line with this view, I sincerely believe that the competition which subscription television would give to the present advertising programs would tend to be far more effective than any conceivable Government regulation in eliminating the excesses and abuses of advertising and low-quality television programs about which there is such a wide complaint at the present time.

I would like to turn briefly to the very serious problem which has been facing the promoters of sporting events ever since the advent of television. While many sporting events have been sponsored by advertisers, it has become increasingly evident that the amount the advertisers are willing or able to pay does not make up for the loss of gate attendance. Now, sporting events simply are not free since somebody has to pay for them or the promoters will go out of business.

We are all aware of the fact that there has not been a heavyweight title fight on television over the past 5 years. The NCAA has found it necessary to exercise strict control of television broadcasts of college football because of the tremendous effect the televising of even a few games had upon the attendance at all other college games. However, perhaps no sport has suffered as much from the impact of television as professional baseball.

Major league baseball attendance has shown an almost steady decline since television and the owners and managers of many major league teams have stated they cannot survive on what sponsors are willing to pay for the televising of their major league games in view of the resulting loss of gate attendance. In fact, this matter has become so serious that in three major league cities—Milwaukee, Pittsburgh, and Kansas City—the owners of the clubs have refused to permit their games to be televised.

The impact of television has been even greater upon the minor leagues, since the network televising of a major league game in a minor league city cuts down the attendance and interest of the public in the local team. The catastrophes sweeping the minor leagues have reached such proportions that something simply must be done if baseball is to survive outside of the major leagues. As an illustration, in the year 1950 there were 58 minor leagues who entertained over 35 million fans. By 1955, 25 minor leagues had been forced out of business and the attendance of the surviving 33 leagues had fallen off by 46 percent over the minor league attendance of 1950.

If the public desires to continue viewing sporting events in the comfort of their homes, they are going to have to pay for it since advertisers simply cannot pay enough to make up for the ensuing losses in gate attendance. In this respect, subscription television would be a boon to many local and national sports which are now suffering severe economic losses as a result of the impact of television.

The minor leagues could also benefit substantially from subscription television. In the first place, the convenience of having minor league games available over subscription television would place the minor league team in the position of overcoming the law of inertia on the part of the public which tends to keep them glued to their sets at home, watching various types of less interesting entertainment rather than going to the ball park. Equally important, to the extent that major league games are broadcast by subscription television in minor league cities, arrangements could undoubtedly be made with the major leagues which would give the minor league city a share of the subscription receipts in its city resulting from the subscription telecast of the major league game. This income would compensate the minor league team to some extent for the loss of gate attendance resulting from the television broadcast of the major league game in its community. Since the existence of strong minor league teams is essential to the existence and quality of the major leagues and because of the general interest in baseball which the minor leagues generate, it would obviously be in the self-interest of the major leagues to permit the minor leagues to participate in the income resulting from the subscription telecasts of their games.

Under present circumstances, advertisers are unable to pay any more than they are now paying for sporting events. In this connection, I have been given to understand that the networks are having extreme difficulty in finding a sponsor who is willing to meet the $3 million demand (an increase of $2 million over previous years) of the major league clubs for the televising of the world series. The day is rapidly approaching, and indeed has arrived in connection with many sporting events, when the American public will be confronted with one of two choices—either to pay for the viewing of major sporting events through the medium of subscription television or go without viewing such sporting events in the convenience of their homes. In my opinion, faced with this choice, the public will willingly support sporting events through the medium of subscription television, which in the long run would be much more economic than if the public is forced to attend all major sporting events at the stadium or arena.

In conclusion, I would like to state that in my opinion the Commission has all the legal authority under the present Communications Act which it needs to authorize subscription television and that, therefore, no further legislation is required. However, I believe that this committee can serve a useful purpose by making clear to the Commission that in its opinion the present financial distress of the television industry and its inadequacies in terms of a competitive national system serving all of the people and in providing outlets for local expression in the smaller communities make it imperative that the Commission take immediate action. This could be done if the Commission will lift all artificial restrictions which prevent the television industry from obtaining the new and supplementary source of economic support which subscription television makes possible. As Commissioner Robert E. Lee has so appropriately noted, the ultimate acceptance of subscription television properly rests with the American public. Certainly, under our system of free enterprise, government should be the last to attempt to prevent the television industry from taking the new product of subscription television to the market place to compete for a share of the American public's entertainment budget.

I thank you for this opportunity of presenting views which I have accumulated over a considerable period and which are the product of much thinking on this intriguing controversial question.

Senator PASTORE. Our first witness this morning is Dean Charles C. Caveny, of the undergraduate division of the University of Illinois.

Would you identify yourself for the record and show what interest you have, and then proceed in any way you like?

STATEMENT OF CHARLES C. CAVENY, DEAN, UNDERGRADUATE DIVISION, UNIVERSITY OF ILLINOIS

Mr. CAVENY. Thank you, sir.

My name is Charles C. Caveny, and I am interested in subscription television because of my experience. My experience is in State planning for higher education, also the experience I have had in research in the use of this device for educational purposes.

I should like to try to clarify a few technicalities and misconceptions about educational television. I also am concerned as a member of a board of one of the channels assigned for educational purposes—1 of the 252 channels that have been assigned by the Federal Communications Commission.

I am sorry to say I have no script except a few notes which I have. I do have a small statement which I would like to relate.

Mr. COX. Is this station to which you refer—the educational station—now on the air?

Mr. CAVENY. Yes, sir; it is 1 of the 15 of the 252 which is on the air, and my concern has always been, from the beginning, as to how are we going to keep these channels on the air, even if we are successful in getting them on the air.

In the first place, we haven't been too successful in using the channels to date. That is understandable.

Senator PASTORE. Now, on that point, Mr. Caveny—and I think the American people are very much interested in this phase of the problem that you have just raised—is it an economic question, or is it lack of interest on the part of the public in this type of program? Essentially, that is the question that confronts the American people. The economic problem which results is a consequence, but fundamentally educational television was instituted for the purpose of promoting the welfare of the people of this Nation. Now, if these stations are not surviving, is it because there is a lack of interest which results in an economic depression, or is it something else? Are you going to develop that?

Mr. CAVENY. I would like to develop that.

Senator PASTORE. I hoped that you would because we are very much concerned with this. There have been certain allocations to educational television, and I have always thought it was a magnificent thing. Now, if it doesn't turn out to be that because of lack of interest, I was wondering whether it needs a shot in the arm, or whether or not it is a fundamental question.

Mr. CAVENY. Well, sir, I wanted to say that I believe the assignment of the channels was a very wonderful thing for the general welfare and for educational purposes, but it is something like planning for this great tidal wave of students that are coming in the future, that are on their way now. It is so difficult to convince the public in general of the needs in advance of the actual utilization of these channels. For instance, in higher education, we have what you might call four different student bodies. The first group are the college youth—the full-time day, as we refer to it, college-age youth. Well, we all know that the increased birthrates have been very high, and we all know that most of the institutions of higher education are predicting—and there is pretty good authority for that with the increased number that are attending college, in addition to the increased birthrates of those that are moving into college age. The enrollments in our own State, for instance, we anticipate will double by 1970—that they alone will double over the 1954 enrollment. At the present time, the enrollments in higher education in our State are 5,000 greater than they were at any other time in the history of the State. Now, that is the first group.

The second group is the part-time group, the employed people who wish to pursue a college degree, or a college education.

Then we have a third group, which is the graduate field, graduate education. That is for advanced degrees.

Then we have a fourth group which could be classified as the terminal group—terminal education, and extension education, and correspondence education.

Now, those four groups are somewhat of a responsibility for programs of institutions of higher education, and because of the tremendous increase in the college-age youth—in the first group—it is going to require a considerable expansion of facilities, a considerable expansion of the staff; that is, the teaching staff. And actually there is an inverse movement—as the need is getting greater, the number of qualified staff is getting less, as we know, in that field.

Now I see televised education as a device for helping with not only the shortage of supply of trained staff, but also as a means of expanding the tuition-paying groups that will help to afford the cost of these total programs. It is so difficult, of course—when you haven't reached that large segment to be served—it is so difficult to convince those that provide the funds that these preparations and these facilities must be prepared for meeting this expansion as it comes along.

Now I want to qualify this matter of televised education. I refer to it as televised education rather than educational television. The reason I say that is that at the present time we are engaged in research in the use of television so that it can be used as a device for televising education of the kind that is needed to carry on organized, systematic study under a qualified professor—one that is a scholar, one that is an authority in his field, and one that is articulate enough and well enough schooled in the techniques to do a good job of education. Now these channels are—the channels that we are using now are doing a fine job of educational television, which is somewhat of a different purpose than the type of thing that we are going to need very shortly—and when I say "need," I mean televised education—the difference being this: Educational television is not the organized—it does not have as its purpose organized, systematic study leading toward an attainment which would be measured in terms of educational standards. Rather, it must be presented by educators—an educator-broadcaster, rather. It serves the purpose of general education and is somewhat along what we would classify as something that requires techniques of showmanship and appealing to the public in general and in support of these programs. In other words——

Senator PASTORE. Now just so that the record will be clear on this point, because I tell you very frankly, coming from you, Mr. Caveny, dean of the undergraduate division of the University of Illinois, I am rather intrigued at the presentation that you have made thus far. Maybe I do not completely understand it.

Now you speak first of your first category, and you have pointed out the fact that because of the increase in population we are facing a situation now which will become much more aggravated in the months to come; that there aren't college facilities enough to accommodate all our college eligibles—is that the argument that you are developing, and that this will be a way of bringing education to this great vast group of young people; is that the argument being made here?

Mr. CAVENY. No, the argument is this: It is a matter of financing these channels, a matter of affording to operate these channels; and because of the demand for funds for this great surge of college-age youth in the full-time program, the other programs will have to be self-supporting, meaning that they will have to have resources, financial resources from some other source. The colleges are going to find themselves, and do now find themselves, in need of funds to operate or to utilize these channels for televising education.

Senator PASTORE. But are we talking about extension courses now or are we talking about the fundamentals that we consider in an organized college of today? Will a young boy who gets to be 18 and graduates from high school be placed in the position that he can go to classes in his own parlor and finally work himself up to a degree—is that what we are talking about?

Mr. CAVENY. No, sir.

Senator PASTORE. Because we do not have facilities?

Mr. CAVENY. No, sir.

Senator PASTORE. What kind of education are we talking about?

Mr. CAVENY. Now the colleges and universities will serve the college-age youth; they will use their resources to serve the college-age youth. But in addition to the college-age youth, they have these programs of part-time evening—that is, the later evening portions—for more than the college-age youth, for those that are employed, adults that are employed, also for graduate teaching.

Senator PASTORE. What is usually known as an extension course?

Mr. CAVENY. That is the fourth group. The terminal, correspondence and extension courses have always been self-supporting; the students pay most of the costs.

Mr. Cox. Isn't your basic point that in order to provide service to these four classes in the more or less traditional way, the legislatures of the various States, or the other sources of revenue of private institutions, are going to be so taxed that they will not have the funds to also carry on the function of educational television unless that function can be made to support itself, as through subscription?

Mr. CAVENY. As through subscription; that is right.

Senator PASTORE. Well, the impression I do not want to leave here—and I hope that we make it abundantly clear on the record—that we are not speaking in terms of lack of facilities for the development of a good staff, or a good faculty, to the point where this is going to be a substitution for our usual concept of a college education.

Mr. CAVENY. That is right.

Senator PASTORE. I do not think we ought to leave that on the record, because that would be awful if we are going to say, "Well, now, you don't have to go to college anymore; you go to class in your own bedroom."

Mr. CAVENY. Oh, no; I had no intention of giving that impression. What I was really trying to say, as the gentleman brought out here, is it is a matter of having the resources to do all of these jobs.

Now actually speaking of televising education and extending this service, generally in many accredited institutions, it is possible for adult students and others to earn about one-half of a degree—that is, they may earn one-half of the essentials for a degree. Now also in terminal education we feel that we have an obligation there, and that is usually given to the students that do not attain a degree. For instance, the mortality rate of those students that matriculate toward a degree is as high as 62 percent in the only study that has been made of any great extent. That is, 62 percent of those that matriculated in about 1,200 of the 1,400 accredited institutions that were studied, 62 percent never attained a degree.

Now those young people usually carry on their work by either extension or part-time work, or they are served by what we classify as terminal education which means that they are not carried to the degree level but they are given work toward vocational or technician objectives. In other words, it is a means of serving those students that do not have the capacity for earning a professional degree.

Senator PASTORE. And is it your understanding, then, that the system of subscription television will tend to broaden the base of education on the part of certain individuals who ordinarily would not get this education unless it was through this opportunity; is that the argument that you are developing?

Mr. CAVENY. That is right.

Senator PASTORE. It would not detract from nor change our present system?

Mr. CAVENY. Oh, no; it would supplement it.

Senator PASTORE. It would not discourage attendance at college?

Mr. CAVENY. Oh, no.

Senator PASTORE. It won't discourage endowment to colleges in order to sustain this great institution of voluntary education and private education?

Mr. CAVENY. That is right; it is just another source.

Senator PASTORE. But it would more or less broaden the base of education on the part of certain people who ordinarily wouldn't have the opportunity, unless it was because of this medium; is that the argument that you are developing here today?

Mr. CAVENY. Yes; that is right.

Senator PASTORE. And consequently the fact that they might have to pay some small amount for it, would produce better educators in order to give them this kind of education?

Mr. CAVENY. It is another resource, in other words. It is a resource which means that it can be used for televising education, not just for entertaining through educational subjects, but by televising education to serve an educational objective.

Now the device also will make it possible to extend the services of a qualified professor; that is, to utilize his services on a broader scale, because his program can be televised, and he can serve more people at the same time. In other words, you can extend his services by what we might classify as—in research they do it by closed-circuit work at the present time; that is for experimentation purposes.

Senator PASTORE. Well, for the purpose of the record, what tendency would this have, for good or for bad, on our prevailing educational system?

Mr. CAVENY. Well, it is another resource. In other words, it is another resource for teaching purposes, for televising education; and it is also another income resource for helping to finance this type of program of education, other than the regular college-age youth group.

Now I have a statement that would require a few minutes to make, if I may.

Senator PASTORE. Yes.

Mr. CAVENY. Perhaps it would give us some grounds of understanding what I am trying to develop.

For instance, the position taken recently, right here in Washington, D. C., by the members of the American Council on Education—they made this statement last month, and it is, incidentally, typical of the educators' concern over this possibility of using television for televising education. They said that to meet the demands for training intelligence which comes from every segment of our society—the professions and vocations, business and industry, Government, agriculture, and labor—the opportunity must be given to every American citizen to attain the righest level of education and training of which he is capable. We must be concerned with individuals at all levels of ability. We must also provide educational opportunities over a continually increasing span of life, and hence we must continue to develop new educational resources, diverse types of institutions, and additional courses of study, and new techniques of instruction such as educational television.

Now that was a statement that was made by this group. Then the statement has often been made that if it is true that what happens to American education will happen to America, the deficit in dollars, teachers, classrooms, and services in meeting the load of today alone—without considering new members and new numbers of tomorrow—mark out a national concern as serious as how to defend ourselves in a world of international tensions.

They stress that to defend ourselves effectively we shall have to depend upon brain power more than manpower, upon new ideas more than arsenals, upon the morale of people more than regimentation, and upon economic strength more than diplomacy; in other words, that education is becoming an integral part of our whole social need.

Now, then, for a personal observation I believe that I should be able to testify to the needs in educational resources because of my present responsibilities as an administrator, in which I am trying to actually convince people that our need is not so great immediately, but our need is going to approach us more rapidly than we are going to be prepared to meet it, and because of past experience. Now I have had considerable experience—and without going into that, I might say that it includes teaching in all levels, high schools, colleges, universities, State supervisor as well as a representative of the Office of Education—and I can attest to the fact that we need more highly skilled teachers, and we need all of the resources we can get to meet these varying needs, if we are going to meet the needs of the youth in college today and meet these other needs that are essential.

Now during the war it was my responsibility, in charge of one of the programs in electronics, to produce technicians for the Navy's use in a speeded-up, very intensive program. In doing that we had to develop new techniques, and particularly one using visual aids, so that we could not only produce well-trained technicians to take over this electronic gear on board ships but also so that they would be able to handle any type or any kinds of equipment in their application.

So we, by the use of a special testing method which is too lengthy to go into in detail, but by the development of special testing methods and by the development of visual aids, we were able to increase the perception of the individual student about 90 percent, that is over the traditional method of teaching.

In other words, these techniques added up to a matter of speeding up the comprehension on the part of the individual student by 90 percent over the conventional methods that we had used previous to the development of these visual aids. I stress the importance here of television as a teaching medium, because of that visual aid factor as well. It is because of this experience that I come here to testify in behalf of the device which I believe to offer great hope in making televised education a reality, and I firmly believe that we shall need subscription television to help finance the use of this great communicative device, and especially for educational purposes.

World War II found us woefully lacking in our ability to train technicians fast enough for our needs, and we used a new technique which involved visual aids which can be used more effectively—these visual aids can be used more effectively through television than what we used them for without television.

Senator PASTORE. Now would you explain, at this point, how you would envision that subscription television would meet this need?

Mr. CAVENY. Well, sir, in that case I would have to say that television itself is the device I am speaking of, regardless of whether it is subscription television or not. But subscription television would make the equipment available out in the field that could be used for televised education, meaning it makes it available for use and, therefore, I speak of television as televising education. Subscription television fits into the picture in this way: It would make these people tuition-paying students in an organized, systematic method of study rather than just watching television to get educational recreation or educational information.

Mr. Cox. You would contemplate, then, the televising of formal courses of instruction?

Mr. Caveny. Yes.

Mr. Cox. Followed up by examinations?

Mr. Caveny. Indeed, yes. Now we have experimented with courses already by following up—that is with textbooks and the writing of examinations and the formal type of education, and it has been responded to very well.

Mr. Cox. So the subscription payment would, in effect, be a substitute for payment of tuition?

Mr. Caveny. Yes.

Mr. Cox. And the device of television would multiply the effectiveness of the instructor by enabling him to be present in many communities, whereas if he were to pursue the normal methods of extension teaching he would have to actually travel physically to all of these points?

Mr. Caveny. Right, like he does in extension education. In other words, it is just a supplement to extension education, or to correspondence, but more effective, and would also reduce the cost because an individual now, in my prediction, pays much more for a course than he will have to pay if the device is usable for that extension education.

Senator Pastore. Well, I am glad, Dean, that you made the last statement as to a supplement to extension or correspondence education, because I am one of those who feels that we are fast reaching a crisis in our educational opportunities in this country, if we are not already there.

We hear time and time again that the Russians are producing 54,000 scientists or engineers a year, and we are producing scarcely 17,000. We are not producing quite the number of doctors that we need in this country, and we find many of our students are attending graduate schools or medical schools in foreign countries that have to rely on us for foreign aid to prop up their economy, and that is a paradox. I cannot understand why it is necessary for an American boy to seek a medical education in a foreign country when that foreign country has to look to us for economic aid.

If we have to help these people, and they can sustain these institutions, and we cannot sustain them ourselves, I wonder if we are meeting our obligations on the educational line. I have felt for a long time that the Federal Government, without interfering with the curriculum of colleges, could do more in the way of financial aid, even by way of scholarships, in order to encourage these institutions to attract better qualified teachers and professors to give us the opportunities we need for our young people. I do not think we want to leave an impression here—and I do not think you intended to, and I wanted to clarify that—that this is going to be a substitution for a responsibility that we have to meet along organized orthodox lines.

Mr. Caveny. You are so right, sir.

Senator Pastore. We do not want to leave that impression. What you are talking about is a broader base of extension or correspondence education, people who could not go to a college anyway if the opportunity was there.

Mr. CAVENY. That is right.

Senator PASTORE. But we do not want to do anything to detract from that opportunity for our young people, boys and girls who want an education, either in the graduate phase of education or even in the elementary phase of education, to get that education, if they really want it.

Mr. CAVENY. You are right.

Senator PASTORE. That would be a sad day for America if we drifted into that.

Mr. CAVENY. I am lamenting the fact that we are unable to serve adequately the demands now, and I am saying that this is one device that I see as a possibility of supplementing and spreading the cost over a larger number of tuition-paying students that will help the institutions, private as well as public, to serve those needs. Actually, most people think that private institutions get their resources from tuition. Well, actually what has happened is that the cost of education has increased in much greater proportion than they have been able to increase tuition, and also the cost of education has increased so much that every student is subsidized the minute he enters an institution, regardless of whether it is public or private. I mean that students' education is being subsidized from some source.

Senator PASTORE. In other words, what you are actually talking about is this. Let's assume that in the line of law—after all, I speak of that because I happen to be a lawyer—if, for instance, a lawyer felt that he would want to subscribe to a course, a special course, let us say, in one of the specialized fields like taxation or trust law, then that course could be held out by a very reputable college or professor, and those who desired to take it could actually subscribe to it and have the advantage of having that course in the evening in their own home—or in their own office if they had a television set in their office—without the requirement of maybe traveling down to Washington or going to New York to get it; is that what you are talking about?

Mr. CAVENY. Yes, I am; and at less cost, as well.

For instance, we have extended dental education to thousands by long lines telephone, but it is very expensive. And also this device would offer better technique for putting over an organized study program.

Senator PASTORE. In other words, we would not be making doctors and lawyers over television, but we would be making better lawyers or better doctors or better dentists by the use of subscription television?

Mr. CAVENY. That is right. That is what we mean by extension, or what we mean by part-time education. It is one of the four programs that we have not done an adequate job on, in my opinion. We haven't served that need to the extent that we should. Our peacetime educational needs, for security purposes and for living in our industrial economy, is greater than ever before, because actually more people are seeking more education.

It must be recognized that there is a great misconception on the part of the layman as to just what we mean by televised education, and I would like to clear this up. Let me assert that televised education is not the same as educational television. I should also like to add that there is confusion about the difference in the knowledge and skills needed to operate these two programs, which have entirely different objectives.

Briefly, educational television and televised education have different purposes. One entertains and is measured by numbers of viewers attracted, whereas the other teaches and is measured by educational standards.

Educational television requires a great amount of showmanship on the part of the producer, whereas televised education requires participation of a well-informed scholar, skilled in teaching techniques. We humorously say that one counts ears and the other counts minds. What I am trying to emphasize is the fact that we need television for televised education as well as educational television, and that this device, subscription television, would make the equipment, which is complementary equipment to our needs, available for actual formal televised educational programs.

Now there is a common ground on which the commercial and educational broadcasting meet, and that is they must both be expert in the use of the television equipment. Commercial broadcasting equipment is essential and, as I mentioned, it is complementary to the educational broadcasting in the same way that the transportation systems are complementary to national defense or to the mail service, and so forth.

Educators see televised education as a great hope toward the extension of their inadequate facilities, as a device for improving techniques of teaching, and as a means of serving a great need in adult education, which has been lagging in adequate service for some time. They are already busily engaged in research to find the best ways to use television, particularly for closed-circuit use—and, incidentally, closed-circuit use means extending the classroom or the laboratory to remote places through television receivers. Now it is true that the research is being done somewhat through coaxial cable, but I am thinking in terms of closed circuit between the institution and the home, because it can be closed circuit regardless of whether it is transmitted over a cable or whether it is transmitted over the air.

Now in this research, there have been some very fascinating experiences, such as color television, which will still make it more suitable for teaching chemistry, for instance, or doing demonstration work, using this visual-aid technique. But another factor has been that in an ordinary lecture—I recall of one incident where they permitted the students to choose whether they wished to come into the lecture room or whether they wished to go to one of the remote rooms where they had television receivers, and those back of the ninth row all chose to go to a television room rather than in the lecture room, which is indicative of the fact that they did not have the same advantages as the people in the front row, which means to say that television is a device for giving everyone a front-row seat, as a technique for teaching, as a teaching device.

Senator PASTORE. What do you do if you want to ask a question, though?

Mr. CAVENY. Sir, that is one of the techniques. In developing the use of education by television, or televised education, most of the questions that should be asked—and in many cases in formal classes they are not asked— the two-way communication is with the projecting class, and the questions are always arranged so that they are asked to bring out the salient points of instruction, and that is one of the techniques. Not only do you bring out the salient points, by questions and answers, but by illustration and by visual demonstration, using schematic diagrams and many other means.

The use of televised education, which means serving greater numbers, to us, of tuition-paying students, will spread the cost among greater numbers and will reduce the cost to both the institution and the students served.

Now as you know, as I mentioned, the Federal Communications Commission recognized the importance of televised education by allocating these 252 channels, for nonprofit educational stations. Unfortunately, to date there have only been about 15 of those stations put into operation. They were intended for televised education, according to my contention. The ones that are being used today are being used for educational television, which means that they have not as yet—even the 15 that are in operation—have not as yet launched into televising education, which means the serving of the people that have needs for this organized systematic type of study which will make our professors that are well qualified more available to them than has been true heretofore. And it is for the simple reason that funds have not been available to erect the stations and to put them into operation, and I do not see how—with the great surge of students that are coming toward us, of the college-age youth, plus the great demand by these other three groups that I mentioned—I do not see how the financial plight is going to get better. In fact, it is going to get worse, meaning that it will take all of our financial resources for doing the job at hand.

Senator PASTORE. Is your institution now utilizing an educational facility, a television channel?

Mr. CAVENY. Sir, we are a member of channel 11, which is one of the channels in operation. I will put it that way. The institution itself is not using the channel as an educational institution, but we are engaged with other institutions in the use of one channel.

Senator PASTORE. How has it worked out?

Mr. CAVENY. Well, it is working out very well, as far as the programs are concerned. It has a very fine program in educational television, but the amount of televised education of the type of thing that I am speaking of, that is the formal type study, has not been developed, because if you would do all—if you would limit it to that at the present time, that is to that type, the formal-study type, we would not have adequate facilities available for charging tuition and making the programs sustaining.

Senator PASTORE. Well, I mean apart from the fact of charging tuitions and sustaining programs; I am interested in the efficacy of the system itself—I want to direct myself to that specifically. In your opinion, can this opportunity of educational television be really effective without some formal organized system of education?

Mr. CAVENY. I think it can serve a great purpose through two kinds of programs. One I call educational television, and the other I call televising education.

In other words, if I understand you correctly, I am trying to say that you could not limit it entirely to just formal courses. You must have the general type of educational programs that will serve a purpose also, but I think that it is woefully lacking, and will be, without subscription television. That is really my main point. It is woefully lacking at the present time, and will be, unless we have some way of making these people tuition-paying students.

Mr. Cox. What is the present basis of support of channel 11?

Mr. Caveny. Sir, I personally help to solicit funds. We solicit from industry, we have an organization for going out and speaking to clubs, and we are passing the hat, so to speak, and my point is that if we have to rely upon that completely we are losing a great resource over here which would be available to us through subscription television.

Mr. Cox. Which you are not now able to take advantage of because it is not authorized and the equipment is not available?

Mr. Caveny. It is not available and it is not authorized.

Mr. Cox. What rates would you propose to charge for a typical course of the kind you are considering?

Mr. Caveny. We are just in the process now of research in the use of this device, and, therefore, it would be impossible for us to get into the economics of it, because we have been engaged merely in how this device can be used most effectively, and I couldn't answer that question.

Mr. Cox. Have you conducted any experiments, such as some educational stations have, where they provided a formal course—not as formal as you are contemplating—over an educational station, and they provide a syllabus if the viewer writes in and sends them a certain amount of money? Have you any basis on which you could project an estimate of what the public would be willing to pay?

Mr. Caveny. Well, we have done that over a commercial station, and on the commercial station the appeal was very good for the type of course that we offered. I think they paid $5 to participate in the course without written examinations, without credit, and for the course with credit they paid something between $12 and $15, and then they wrote the examinations, and were able to get the credit for that work.

I would say that that was in a very experimental stage, also, and that we have not yet developed the technique of using this equipment to the place where it will be by the time that it is needed.

I should say that at the present time the colleges are able to meet all of these four programs fairly well, but I am speaking of convincing the public, or the people, the powers that be, in advance of the need, because we know from demographers that the need is going to be great in all of these four fields that must be served. We are having a difficult time convincing our public that we shall need certain facilities, and certain staff, and other things, and funds, to be prepared to meet this great group when the time comes.

Now, the same is true with television.

Senator Pastore. Now, a question at that point. You mentioned channel 11. Without getting into the technical aspects of it, which I don't know, and which can be developed later on, can you see a combination of both free and subscription service with reference to channel 11, for instance?

Mr. Caveny. Definitely, sir.

Senator Pastore. You could have part of it without subscription and part of it with subscription?

Mr. Caveny. That is exactly what I mean. Again, the income will supplement the program, not only to sustain what we have now, but to add the televised education, the formal type education, and do a better job.

Senator PASTORE. In other words, what you are saying is: Here is channel 11 in your community now, which is strictly an educational channel.

Mr. CAVENY. Yes, sir.

Senator PASTORE. Now, if part of the services of that particular channel were devoted, even, to subscription television, so to speak, in order to give a more formal type of course, you can see that as a very helpful and healthful situation?

Mr. CAVENY. That is right.

Senator PASTORE. Without destroying the other element of it?

Mr. CAVENY. In fact, it will improve the other element of it, and the other element needs improving. In other words, that is fundamentally the vision that we have as subscription television's contribution.

Mr. COX. How many hours a day does this station program now?

Mr. CAVENY. I think it runs 5 days a week, or 6 days a week, from 10 to—I think it is a 6-hour program daily; I am not sure.

Mr. COX. And you think perhaps this might permit extension of that, so you could give a fuller schedule?

Mr. CAVENY. Not only an extension, but a higher quality program, more emphasis on the education and less on the entertainment phase of the program.

Mr. COX. Now, do you see this kind of program as confined primarily to utilization by the noncommercial educational stations presently provided for, or would this also be a source of programing for commercial stations?

Mr. CAVENY. As far as I am concerned, as an educator, it makes no difference whether it is used over the 252 channels, or all of the other channels. The main thing is that this system will be out there that will be usable for educational purposes.

Mr. COX. But your need for a device for getting in revenue in connection with this is greater in connection with the educational channel than in connection with the commercial station?

Mr. CAVENY. Yes, and to raise funds now, you have to put the emphasis on the appeal and on the showmanship and on the entertainment, and what I am talking about is formal education and the need for it.

We all recognize it, but we are not recognizing resources and means of doing it. Also we mustn't lose sight of the fact—you mentioned engineering, and what Russia is doing. Well, I happened to be an engineer in my undergraduate work, and I have done a great amount of work in teaching in engineering, and as an administrator, and I would say that we have a shortage. We are competing with industry. We are competing with Government. We are competing for staff, for our trained personnel. We are losing some of our best personnel.

For those that we have that are good scholars, well-trained authorities—and personal appeal is a factor in teaching as we all know—that will make those people more useful through television extension. It will make them more useful to us. We can use them for our class obligations, college-age youth, as well as make their valuable services available through televised education to adults and these young people that are not able to finish.

Now, that 62 percent, the mortality we refer to that never attain a degree, they are not dropping out of school because of scholastic reasons. It is true that the majority of them, a high percentage of them, drop out for scholastic reasons; but many of them drop out for many other reasons, and, therefore, they deserve an opportunity to continue their education if they can have the opportunity.

Senator PASTORE. Mr. Caveny, we want to thank you for appearing here this morning. You have been very instructive.

Mr. CAVENY. Thank you, sir.

Senator PASTORE. Now, I have two witnesses listed for this morning's session, and we are going to stop here at 12:30. I was going to direct my question to Mr. Lou Poller and to Mr. Theodore Pierson. I don't want to cut any witness short, but I was wondering if we couldn't determine at this time exactly how long you might take, so that we may fit you both in so that when we recess by 12:30 we would have completed. Now, Mr. Poller, how long do you expect to be?

Mr. POLLER. Ten or fifteen minutes.

Senator PASTORE. Is Mr. Pierson in the room?

Mr. PIERSON. Yes, Senator; I will not be more than 10 minutes.

Senator PASTORE. Well, that sounds good. The rest of it, of course, depends on how long we delay you.

Mr. PIERSON. I will say, to the extent that I have control.

Senator PASTORE. All right, we will try to complete, at best, Mr. Poller, by 10 minutes to 12, and then the remainder of the time we will give to Mr. Pierson.

Mr. POLLER. Thank you.

STATEMENT OF LOU POLLER, PRESIDENT, TELEVISION EXHIBITORS, INC.

Mr. POLLER. My name is Lou Poller; I am president of Television Exhibitors, Inc.

Television Exhibitors, Inc., is about to file an application with the Federal Communications Commission for authority to construct and operate a number of television stations in various cities and to be authorized to present some programs for which the public will be asked to pay an admission price, which should be considerably less than they now pay for comparable entertainment.

We are asking the FCC to authorize these stations in cities now being served by multiple signals of at least the 3 networks on 3 separate channels. We are further asking that the stations authorized to charge for programs be confined to the UHF band for a period of at least 5 years. The public will, therefore, continue to have the choice of the same programs they now receive as well as the choice of additional programs not now available to the public on the UHF stations proposed.

Mr. COX. This, then, is strictly a proposal for supplementing available programing, and would not in any case involve the blacking out of an existing program service?

Mr. POLLER. It will not in any way interfere with the present programing.

A great deal has been written and argued about the failure to properly utilize 85 percent of the TV spectrum which is represented by 70 UHF channels. The most capable people in the industry have wrestled with the problem for 3 or 4 years, and we are just as far away from a solution as we ever were. The merits of VHF and the inadequacies of UHF served for a time to emphasize, by argument only, the advisability of scuttling UHF completely. It should, therefore, be obvious that our application requests facilities that are not now very popular, and that have been returned to the FCC faster and in greater numbers than have been utilized.

Since there are no statistics upon which to base a legal argument for or against pay TV, all arguments presented must necessarily be based upon conjecture and opinion. One of the arguments against the adoption of pay TV has been the effect on existing programs and performers. Naturally, when a performer such as Grace Kelly, who was seen free on TV, was promoted to the movies as a great star and was no longer available without paying an admission price, the networks did not close down, nor ask the Congress to take action against the movies.

Mr. Cox. Isn't it true, though, that if a television performer were hired away, in effect, from present sponsored television by the offer of higher rewards on subscription television, you would get a little more acute and direct competition in that he would now be competing on the very same medium in which he formerly engaged?

Mr. POLLER. I would think so, and I would think that condition exists today, not as between paid-TV and TV, but between all other means of entertainment and expression.

Mr. Cox. But the point I am making is that at least when Miss Kelly entered the movies rather than television, the competition required the person who wanted to view her to leave his home, go to the theater, and pay the higher charges.

Mr. POLLER. Surely.

Mr. Cox. Now, if she had transferred her allegiance to subscription television instead, all of this would have been available, presumably at reduced prices, in the living room and, therefore, the impact upon sponsored television would have been more direct and more acute.

Mr. POLLER. If the Prince will permit us, we will try to bring her back in the living room. [Laughter.]

Only a few years ago, I presented on radio, free to the public, Bill Haley and his Comets, and also the Four Aces. Bill Haley appeared daily for over 5 years on station WPWA in Chester, and his followers could see and hear him in the local nightclub by merely buying some refreshments. Today Bill Haley gets $2,500 an appearance, and I must say that his early, loyal fans and I are very happy for him, and are not asking for legislation or other actions to prohibit Mr. Haley from rocking and rolling for a fee, nor do we disagree with the Four Aces that Love is a Many Splendored Thing.

Therefore, any threat in whatever form to one type of free enterprise inducing talent to achieve greater public acceptance by means of another free enterprise is a healthy American system. Only the public can bring about a change which they wish and that is as it should be.

During the 5-year period that we are asking the FCC to permit this kind of programing, we are suggesting that only 25 percent of our programs will be presented for a charge, and the 75 percent will be just as competitive for audiences without charge as are the other TV stations. We anticipate that the revenue of such a free-enterprise system will be adequate to enable us to do far more public-service programing in more desirable times than is possible under the present system.

Mr. Cox. Well, now, if you have 25 percent of your programing devoted to subscription service won't you tend to concentrate that in the evening hours, when the largest audiences are available?

Mr. Poller. I would think so.

Mr. Cox. Therefore, those hours would still be pretty well denied to public-service programing.

Mr. Poller. We are not quite that optimistic that the public will keep spending all night long. We believe there is a limit to how much they will spend, and after they have seen a feature in the evening, which should take less than 2 hours, we feel that they have had it.

Senator Pastore. How much supervision would you expect from the FCC with relation to the type of program and the charges to be made?

Mr. Poller. Well, there are two questions there, Senator, as——

Senator Pastore. I will ask them one at a time, then.

Mr. Poller. As to the type of programing, I don't believe the FCC has attempted to police or censor programing.

Senator Pastore. Don't you believe that after all this is a medium that belongs to all of the people of the country, and if you are going to begin to charge a specific price that somehow there ought to be some kind of supervision as to the fairness of the price?

Mr. Poller. I think I cover that.

Senator Pastore. Well, I am anticipating then. You may go forward.

Mr. Poller. The application we are filing with the FCC contains a proposed program called Citizens Day. Let me read from the application:

> At least twice each year the station will declare Citizens Day. During these days a feature presentation consisting either of a sport program, a feature film, a Broadway play, or a musical comedy, will be offered for a standard charge to the public.
>
> It will be publicized that the public, in paying to see the feature, will actually be making a political contribution to either a specified candidate or political party of the listeners' choice. The proceeds from Citizens Day will then be turned over by the station as designated by the listener. The station will not charge for its air time or facilities.
>
> Allowing that there is a potential audience in the country of 50 million receivers, and that the average gross charge for a feature will be $1, it can be expected that the proceeds of $100 million contributed by the viewing audience would go far in underwriting the campaigns on every level from mayor to the President of the United States. The station is prepared to offer additional time to reach this goal.

Senator Pastore. Let me say one thing to you, Mr. Poller. You couldn't have read that quotation before a more receptive group than the Congress of the United States. [Laughter.]

Mr. Poller. I would almost think the Senate has anticipated my statement.

As part of our application, this commitment is a contract that we agree to perform and will be happy to.

Incidentally, Senator, every application to the FCC sets forth a schedule of balanced programing which constitutes a contract with the Commission, and this constitutes the supervision by the Commission. If the application does not represent good public service programing, good balanced programing, the Commission would not authorize it to start with. If you deviate from it, they have the same authority to prosecute you for breaking a contract as any other violation.

Mr. Cox. It is a matter of historical fact that they very seldom have done that, though; have they?

Mr. POLLER. In the past.

Mr. Cox. A lot of these "contracts" that have been made with regard to balanced programing have been breached from the date the station went on the air?

Mr. POLLER. They have been breached from the inception, as an idea. It was a question of who could outpromise who.

We are not confining our responsibility to the public to cease with a plan that is sure to meet with favor by political candidates who have experienced the agony of raising funds and the further pain of dispensing those funds for TV time. Permit me to quote again from our application:

Program policy: It is proposed that during the first 2 years of test programing, the station will restrict programs offered to the public for a charge, to an average of 25 percent of the annual broadcast time of the station. The remaining 75 percent of broadcast time, as shown on the typical week schedule, will consist of well-balanced commercial-type standard operation.

It will be possible to schedule public-service programs in more desirable times since no network affiliation is contemplated. Consequently, no block time commitments will be made by the station.

The station does not propose to sell time for political broadcasts but, in fact, will set aside sufficient time to present the views of the candidates as a public service in keeping with balanced programing.

The station will make available its facilities and ample time for educational programs in both the standard and paid segments of the broadcast day. Educational institutions desiring to offer special courses for a charge will be given time free on the station. This will enable schools to augment their income and broaden their attendance. Similar services will be offered to hosptails, charitable, and civic organizations.

Local advertisers will be given equal opportunity with national advertisers to present programs or announcements in desirable times. It is not anticipated that programs, offered to the public for a charge, will also have commercial sponsorship. However, if as a result of ample research it is found that the public will accept sponsorship on programs for which they pay and the result would be a considerably lower charge to the public, the station would consider offering such a plan for some programs to the public.

The station anticipates that the origin of programs will be numerous and varied. Feature films now produced in Hollywood will increase in both numbers and producers as the need of the public dictates. Stage productions now chiefly confined to New York may as well originate in any city in the country. Sport programs will have many points of origination and as many producers. The station, therefore, will not be under contract to, or obliged to rely upon a single or limited program source. The station will contract on a free and open market for its product. Program origination will therefore be competitive and not controlled.

Mr. Cox. In order to make plans for this programing, however, you are going to have to make arrangements considerably in advance, and it will be essential, if you are going to have programs originating from multiple points, to have pretty standard arrangements for the use of the telephone company's facilities, won't it?

Mr. POLLER. I am quite sure that is so, and I am sure that the telephone company will have to provide more facilities to handle the additional programing from the various sources.

Mr. Cox. In effect, as subscription television grew, if it were authorized in this or any other form, a network would have to be created for the purpose of providing transcontinental transmission or programs?

Mr. POLLER. Or a dozen networks, or two dozen networks. One network might specialize in presenting sports from one area. Another network might be doing Broadway shows only. Another network might do the Metropolitan Opera and related programing.

Mr. Cox. Neither one providing a complete service, all being available upon the selection of a broadcaster?

Mr. POLLER. The same as a department store must have many sources.

Senator PASTORE. Now, may I ask the second phase of the question I first asked you. If you say that one network will, let us say, supervise the sports activities, and another the entertainment, moving pictures, or stage shows, there you have the substance of monopoly, so to speak, over and above the individual broadcasting stations. Now, who is going to supervise the price that is to be paid?

Mr. POLLER. I believe the Senator arrived at a conclusion that was not based on what I said. I said if one network delivers sports, they may deliver sports from the east coast or the northeast section of the east coast, and it will only be baseball or some baseball games. It will be so competitive and it will not be confined——

Senator PASTORE. Well, where will the competition be, that is what I would like to find out. Where is all of this competition?

Mr. POLLER. There will be 4 or 5 pay TV stations in each city, each of whom are trying to get the product. There will be a dozen sources of sports programs alone trying to get the 4 or 5 to buy their particular product.

I may be using this gentleman's baseball games this week, a particular presentation of it, and another's next ieek, whereas the other station in the community would be using his 1 week and somebody else's another week. It will be no different from selling merchandise to a department store. Everybody will be trying to get the merchandise into the department store, and then there are enough department stores trying to get the customer to buy from them in place of somebody else.

This will create the competition that is so vitally necessary in business.

Mr. Cox. Is it your view that competition among program suppliers will control the cost there and competition among television broadcasters will control the cost charged the public?

Mr. POLLER. Yes, and ultimately the public still has the choice between the present free programing and what they will pay for.

I can cover part of that, as I go along. The fact that there will probably be 5 or 6 times as many stations, as I am going to show now——

Senator PASTORE. Are you suggesting in the presentation here that there is no requirement for control or supervision on the part of the Federal Communications Commission as to what you charge the viewer?

Mr. POLLER. I don't see any, Senator; however, the Commission has that authority, and if there are abuses I expect that they will certainly apply the authority.

Senator PASTORE. Do you mean that the Federal Communications Commission has the authority under your system? Let us assume that you sold me a card for a dollar and a half that entitles me to see three shows on your proposal, and the argument you have made here is, because this is more or less a mass-basis price, it will necessarily be smaller than if you had to go to a movie house or had to go to the championship boxing fights.

Mr. POLLER. Certainly.

Senator PASTORE. But, after all, whether you made a 50 percent return on that deal, charging me $1.50, or you made a 200 percent return, would be nobody's business but your own.

Mr. POLLER. I would think so, because at the present time the Commission has before it statements from television stations—one that I know of, that does a little better than $4 million a year volume, and shows a $3 million profit. I don't know that the FCC has asked them to change their rates to advertisers.

Senator PASTORE. Well, because the Congress of the United States isn't too much concerned about rates to advertisers, inasmuch as the viewer sees it free.

Now, we are talking about a different problem. I can turn on my television set, and I don't care what the agreement is between the network and the advertiser. The fact is, when I turn on my set in my parlor I don't pay anything for it, and the Congress of the United States is dedicated to the proposition that it must protect the consumers' interest and the public interest.

Now, in this particular case you are charging the public. Don't you think, essentially, inasmuch as you are using either waves in order to bring this service to the public, and the public is paying for this service, that it becomes a matter of public interest and responsibility to determine just about how much the consumer is paying for this service?

Mr. POLLER. After the Senate discovers why an automobile costs $4,000 and what percentage of that is paid by the public for its television show——

Senator PASTORE. But you are using ether waves here. We are talking about the Federal Communications Commission. Henry Ford, when he makes an automobile, doesn't have to go to the Federal Communications Commission, nor any other agency, because it is not a supervised industry. Now, we are talking about a supervised industry, and the question I asked is, if it is going to be a supervised industry, at what point do you begin and at what point do you end?

Now, you may be talking again about natural gas, but you know how I feel about this. [Laughter.]

Mr. POLLER. Henry Ford, in making his automobile, and advertising it on TV, has to charge me, the buyer, for the program that he shows me. He makes somebody else the collecting agent for it. It isn't quite as direct as this would be, but it nevertheless is there.

The television industry is a billion-dollar industry. Somebody is paying for that. It cannot be free. The gentleman who proceded me talked about something free, and that is why only 15 out of 252 stations are struggling to attempt to get it on the air.

This is free, but the television system and the radio system as I know it has never been free. The billion-dollar industry is collecting money from somebody. If the Senator says that the method of collecting it, whether via an advertiser through an agent into a station, or a network, is one that the Commission should not supervise, whereas one directly from the public should be supervised, and if there are violations which warrant that, I am sure that will happen.

But it is a common carrier, what the Senator is talking about, and if they have the kind of control that A. T. & T. or any other common carrier enjoys, I am sure it should be regulated, and will.

Senator PASTORE. Well, now, wait a minute. Why must we wait for the abuse? It is the principle of which I speak. We control the rates that are being charged. We supervise the rates that are being charged by railroads and other transportation facilities because it is an industry that must be supervised in the public interest. Now, why is this any different?

Mr. POLLER. I don't think it is any different. I don't believe A. T. & T. was supervised until it matured. There is no way to supervise, as far as I can see, and I believe I cover it a little later. If the FCC were, today, to designate 49 cents as the price of admission, they might ultimately find it is way too low or way too high. I think the industry going into a new phase ought to be permitted to shake down to see if it is a service the public wants, and if it is a service the public wants whether it is competitive enough, which might give it a much better break in the long run if it is competitive. If it is not, then step in and say this is a common carrier.

Senator PASTORE. Well, I get your point, whether I agree with it or not. I get the point that you are trying to make, but here is the story. You start producing a film. Let us say it costs you a million dollars. And you are going to show that film to 50 million people. Now, the price that you charge depends entirely upon the number of people who might be in a position to afford the reception of that service.

Now, after all, it isn't the question of take it or leave it, I think, inasmuch as you are using a facility that belongs to all of the people of the Nation—you are using the airwaves, and they belong to everybody. That is the reason why we supervise it. And we have to supervise these things in the public interest.

Now, why isn't it important, in the public interest, to determine a fair charge that is being made, so that rather than 50 million people being able to see it, maybe 100 million people can see it. Why isn't that important?

Mr. POLLER. As I understand a common carrier, Senator, it is a controlled monopoly. Rates for common carriers were regulated at a time when they were given exclusion. Now, I am quite sure if I were to be fortunate enough to get exclusion for Washington, D. C., so that I were to be the only one, then it could pretty well be determined what rate in advance ought to be charged, and I would be given the same protection of monopoly, the same return on investment, as is given a common carrier.

On the other hand, Senator, if you were to say, today—a million-dollar picture you cannot charge more than 35 cents for, and we are now a common carrier regulated, and we charge 35 cents, and the picture lays an egg, and it only brings in a half million dollars—nowhere, as far as I know in the annals of regulation, are the rates regulated so that the common carrier operates at a loss. I would immediately come back and say this is fine, I can prove now I am entitled to a larger rate, as the buses do, and the streetcars and all of the others.

Mr. Cox. Well, haven't you just illustrated one of the problems of trying to impose common-carrier regulations here, because the service performed by the telephone company or by a railroad is more or less a standardized service which people are familiar with, and demand is foreseeable. You are going to introduce here, though, an element of choice, and an element of taste and of preference, which would make it impossible to predict the results.

Mr. POLLER. Impossible.

Mr. Cox. Isn't it also true, though——

Senator PASTORE. Now, wait a minute. I don't let go of this one too easily.

Mr. POLLER. I would like to go into this thoroughly.

Senator PASTORE. There is nothing I like more than a debate. We are talking here about a monopoly. After all, you raised the question that the reason why we regulate the railroads, and so on and so forth, is because they have a monopoly, so to speak.

Mr. POLLER. Precisely.

Senator PASTORE. You don't have a monopoly in the sense that you don't have two transportation facilities in one community. First of all, your reception is being confined solely and strictly to a UHF station, in a community.

Mr. POLLER. Or stations.

Senator PASTORE. In a community there may be only one.

Mr. POLLER. Precisely.

Senator PASTORE. Insofar as the viewer is concerned, he can only turn on that particular channel to see that particular show, take it or leave it; am I right or wrong?

Mr. POLLER. Certainly.

Senator PASTORE. Now, not everybody in the world can go and build up a new UHF station. They have to show a necessity and a convenience for that community in order to establish a new channel—before the FCC—am I right or wrong?

Mr. POLLER. Correct.

Senator PASTORE. Therefore, insofar as the little viewer is concerned, the only outlet that he has in that community is one, that UHF station. Whether or not he can avail himself of that particular service will depend upon the cost. Now, why isn't that a matter of public regulation?

Mr. POLLER. Because 2,000 communities do not even have that one today, and if that one does get there—there is no shortage of UHF channels—and if that one station does get there, he is still better off getting his choice, if he wants it, or what they offer for whatever price, or not patronizing it at all, and letting them go back out of business again. It is a competitive business. A UHF station for pay is still competing with the theaters and all of the other media of entertainment, and he is not confined a 100 percent of the time.

Now he gets nothing. In that particular community he has no station at all. He is now going to have 75 percent of the station free, if that is the way it finally settles; the other 25 percent of the time he can get a choice of programing which he has absolutely no chance of seeing, and he can still deny buying that one program.

Senator PASTORE. I am speaking from the point of view of the viewer.

Mr. POLLER. I say the viewer still has nothing in those communities today, not even the 75-percent free time that will be available to him. A little community of 15,000—and there are a thousand of them in the country today who have allocations—they have no station.

Now, this is approved. It now gets a pay-TV station. The viewer now has a station which 75 percent of the time gives him standard programing, 25 percent of the time gives him what we might call deluxe programing, for a charge. Now, he can select at that time not to view if he so chooses.

Senator PASTORE. Yes; but you want to change that. You are applying to have the FCC allow you, by regulation, to change that situation.

Mr. POLLER. To institute it.

Senator PASTORE. But you don't want them to change this idea of supervising a fair return or a reasonable profit that you should make on this program, in the interest of the viewer. Now, that is the thing that is bothering me.

Mr. POLLER. I have misled the Senator if I say I am against regulating it. If, I say, it requires regulation, by all means regulate it.

Senator PASTORE. Well, what would be the harm in regulating it from your point of view?

Mr. POLLER. If the Senator has a plan—I haven't been able to devise one. I will give the Senator the best example of it. Let us assume that we regulate baseball games at 50 cents.

Senator PASTORE. The reason I am asking these questions is because these questions are going to be asked, and I think we might as well get these answers on the record, because it is our responsibility here to develop a complete record. Any question that I ask you now I hope is not a frivolous one, and later on, of course, will be asked by others who are not here.

Mr. POLLER. For example, let us take baseball and say that a baseball game lasting 2 hours is bringing a charge of 50 cents. Well, in Washington I doubt very much that anybody would pay a quarter. In Milwaukee they happily pay a dollar. They are very happy to.

Senator PASTORE. For the same game?

Mr. POLLER. It would be the Milwaukee team. I have been in Milwaukee 2½ years; I know what they would do. We would break all attendance records on pay TV in Milwaukee. We would have the privilege of losing a half a million dollars a year.

Senator PASTORE. But if it costs me $6.60 to see a play on Broadway, do you think you are doing me a big favor just because you may be showing that to a million people, so that you can charge me—you can say, "Well, if you went to Broadway it would cost you $6.60; I will sell it to you for $5." Now, you might think you are giving me a big break because if I went to Broadway I would have to pay $6.60; but if I went to Broadway I would buy a ticket, and maybe only a thousand people could see the show. You may be selling it to 10 million people.

Mr. POLLER. The only break I would be giving you would be giving you the choice to turn it down, which you don't have.

Senator PASTORE. That is what I don't like about the argument you are making. Here you are coming before us and saying this is something the public ought to take now. In arguing that point I don't like to see you say, "Well, you can take it or leave it."

Mr. Cox. Won't it be to your advantage to try so to fix the price that it will be taken, and taken by substantial numbers?

Mr. POLLER. I think I cover that.

Mr. Cox. So you try to find a price which will get you the maximum possible number of viewers?

Mr. POLLER. I think competition would do that even if I were silly enough to try to get more, and I believe I cover that in the rest of it.

Senator PASTORE. All right, go ahead.

Mr. POLLER. There are eight times as many radio stations on the air in this country as there are TV stations. The shortage created by the fact that there are only 12 VHF channels with which the FCC is expected to establish a nationwide, truly competitive TV system also means that television rates in Chicago are as much as $750 for 1 announcement lasting but 20 seconds, whereas radio, covering a far greater area, is less than $25 for the same type of announcement. In Minneapolis, a 20-second announcement on television costs $320 whereas on radio, in the same city, it is as little as $10. You therefore have a ratio of over 30 to 1 between the cost of television time over radio time. This can't possibly be in the public interest since, directly or indirectly, the public bears the cost. Likewise, the cost is so high as to preclude participation by local merchants.

The high cost of television creates another and more serious problem, that of balanced programing. An advertiser having a huge investment in a television program must rely on the greatest number of listeners per dollar spent to adequately justify the cost. The result is obvious; 1 advertiser gives away $64,000 to attract an audience and gets a popularity rating of 35 percent of all the listeners; the next program gives away $100,000 trying to get a greater percentage of popularity; 1 program has 4 murders within a half hour and gets a good rating; the next program raises the ante and mows down 6 culprits in a half hour. Silly as it sounds it still means that even the most popular program catering to 1 out of every 3 people fails to reach two-thirds of the public whose tastes are ignored when they do not vote in a pack for a particular program.

Under pay-TV, when you do not have to rely on sponsored programs for all of the income, and when even a minority audience can amply support a program, it will be possible to diversify programing to a point where all segments of the public will be served. Utilizing the 70 UHF channels would mean as many as 2,000 TV stations instead of 400. It will mean more reasonable rates and more competitive programs.

Television Exhibitors would like to present a schedule of rates it proposes to charge the public for various features, but unfortunately there are few statistics in an industry not yet born upon which we can draw, other than the fact that the public will have sufficient choice of programs so as not to have to pay for any program they do not feel worthy of the price.

This, Senator, is a little different from what the Senator put on a take-it-or-leave-it-basis. It is based entirely on the fact that there will be so many stations that they will have a choice. As long as they have a choice, it is not take it or leave it. Where you have one, it is take it or leave it, which is the case in many, many places today.

Just last fall we wanted to see Notre Dame play Miami on closed-circuit TV, and 10 of us paid a total of $40, or $4 each, to witness the game. This I can say, those same 10 people will be table to enjoy an equal presentation at my home if pay TV is approved and the cost will more likely be $1 in place of the $40, and Notre Dame and Miami will not suffer any more deficits in their athletic programs, because they will also share in the income.

As much as we enjoyed Peter Pan and the other spectaculars for free—it's been a long time between drinks, and in the meantime my wife and I and another couple have spent about $150 to see Damn Yankees, Kismet, Affairs of Honor, and a few other fine plays. I am sure that the thousands of people who paid as we did will be very happy to see these same plays at that price who were unable to afford the $150 that it cost. Of course, the performers and the producers will share in the added benefits of mass viewing. All this will be possible when pay TV is presented for public approval—where it belongs.

We will be very happy to come back before this committee a year or two from now and present the statistics of how much it cost to install the gadget so that the public can participate in pay TV, and also present statistics as to how many millions have bought the gadget and on what terms. Trying to prognosticate such figures at this time disregards the intelligence of this and any other committee. The greater the acceptance of pay TV by the public, the less the conversion and cost will be. The better the product, the greater the acceptance.

I often regret the money I spent on the 10-inch, the 12-inch, the 17-inch, and now my fourth, the 21-inch color television set, all in a space of less than 5 years. During the same time, my trusty $199 set has, for only a fraction of the cost, given me thousands of more hours of programs than my color set has. It would have been tragic, however, if the FCC withheld authority for color TV in trying to protect people like myself from squandering our money on what we thought was good value, or if some Government agency prevented Reynolds from selling his ballpoint pen for a quarter today. Strangely enough, pay TV is just the reverse, in the early stages it will be possible to buy a feature that we paid $40 for as little as $1.

Senator PASTORE. Now, that may be true. It may be hard to prognosticate as to a distinct or special formula to initiate as a matter of legislation. But essentially, what would be the harm to the public interest if, in the allowing of this, certain reports, periodic reports, were made by these new operations, reporting to the FCC just about how it is going and compelling the FCC to report back to the Congress, just so that this whole thing may be supervised? Because your contest here is going to be—and you know what the arguments are against subscription television—that one day it might put free entertainment out of business, and the big concern of the Members of Congress is that in no way shall the public be injured. In other words, if this is good for the public, the public ought to have it. If it is a little something more than they have already gotten, they ought to have that additional, too; but, on the other hand, you cannot come in the back door and actually destroy this whole setup of free entertainment. Now, if this thing is not going to be reduced to a level where most of our people are going to have the opportunity of viewing it, don't you see the harm that could ultimately result, because you might detract from the free entertainment. To a certain segment of our people that will make free entertainment uncommercial, and then once you have done the damage, once the damage has been done, there is no way of recouping the status quo. Now, that is the big problem that concerns us.

Mr. POLLER. Senator, the Congress of the United States could be great heroes if they discovered, when pay TV has been launched, that they were taking advantage of the public, and they came in and made them cut the rates down, this would be the equivalent of a tax reduction.

Senator PASTORE. I do not say you would do it deliberately, but you could divert from free entertainment a certain segment of that viewing public which would make free entertainment no longer of the quality that it is, if you detracted enough from it. In other words, a lot of people who could afford to buy subscription television today look a free entertainment, and they have a Hooper rating, or whatever you call it, and they say so many people view it, and for that reason we will put on this class of show free—Perry Como, what-have-you; Grace Kelly, as you have mentioned. Now, the minute you have detracted a certain segment of your viewing public from free entertainment because they were diverted to subscription television, that would automatically, possibly, have the effect of lowering the quality of free entertainment. Now, if it got too much out of control, it could destroy it, unless you had the proper governmental supervision that would hold the two in balance.

Now, that is what I am talking about.

Mr. POLLER. I do not believe anybody would object to that kind of supervision.

Senator PASTORE. Well, I am not prognosticating as to what the formula should be. I am talking about supervision as a principle.

Mr. POLLER. I believe that the Senator would probably discover that, from trial and error, that could be determined a lot easier than to try to set regulation.

Senator PASTORE. I would not want to set it because it may be hard to fix it, but I would like to leave the supervision there, at least, to watch it in the public interest.

Mr. POLLER. There should be supervision. If that is what the Senator is saying, I heartily agree, that there should be supervision. It could turn out to be very fancy oil wells if there weren't supervision.

Senator PASTORE. That is right.

Mr. POLLER. Television exhibitors are asking the FCC to approve an application embodying a potential audience that will be the inducement needed for Hollywood, Broadway, and other producers of entertainment to cast an eye in the direction of this new great market.

A feature film that costs $2 million can hardly be offered to the public on present-day television which depends on sponsorship of only 25 advertisers having such a television budget for an entire year. Consequently, such features are not now available to the public—will not ever be available to the public unless a means like pay-TV makes it possible for the public to pay for proper value received. Fifty million television receivers in the country could make possible the production of a $2 million Hollywood production if only one-third of the people paid as little as 50 cents per set—not per viewer. Will the public pay 50 cents for a $2 million Hollywood production? The public has the right at least to decide whether they want to pay for it.

It is not compulsory and they will still have the choice of paying 2 or 3 percent of the items that they purchase as advertised on free TV and accept gratuitously what the advertiser chooses to give them as a prize in the Crackerjack box, in the form of programs.

Pay TV will, by its very competitive nature, result in better programs on the present TV system—in fact, the mere shadow of pay TV has already brought about better spectaculars.

Competition is the lifeblood of trade and competition in the pay-TV field will result in better programs for less money. It will take hundreds of program sources to feed pay TV instead of the 3 networks and the few independent producers who now decide what the public may see. Many of these sources are now in existence and many more will develop as the needs of the public demand. If the product offered the public on pay TV is not good value they will have the prerogative of not paying to view it and pay TV will be enacted out of existence by the public in the most democratic process known. There is little danger that a $40 value will be turned down by the public for as little as $1.

The mechanical method by which a program will be available only on the television set of those who pay is not of consequence. There are three methods now on file with the FCC and obviously many more will be developed. If the product for which a charge is made is deemed good value by the public, they will pay a fair price for the product. Whether it be by coin box, prepaid tickets, or monthly billing—it is the program that will decide the issue and not the device.

May I summarize briefly by saying that no one seems to want UHF—we do. No listener will be denied anything he now has unless it be that he chooses what we offer for money in place of a program for free—but he will have that choice. This is all we are asking the FCC to permit us to do. To let the American people choose the program, whether it is free or for a charge—but they should be given the right to make the choice.

Senator Pastore. Senator Schoeppel.

Senator Schoeppel. No questions.

Senator Pastore. Thank you very much, and I hope as this hearing develops and the arguments are made, that you may feel free to come back at some other time, because sometimes it is pretty hard to anticipate the arguments on the other side of the question. And that same courtesy will be extended, of course, to those who are opposed to it, because what we are trying to do here is develop a complete record.

Mr. Pierson.

STATEMENT OF W. THEODORE PIERSON, COUNSEL OF THE ZENITH RADIO CORP.

Mr. Pierson. If the committee please, I represent the Zenith Radio Corp. Thus far it has not been heard in the proceeding. I do desire to take a few moments of the committee's time for some rather formal procedures. I would like to introduce in the record comments and reply comments, which are in substantial volume, that we have filed with the Commission so that they will be available to the staff and the members of the committee for whatever references might be desirable. I would think it will fully demonstrate our position before the Commission and also provide answers to any detailed questions that we might not be able to cover in the course of the hearing.

Senator PASTORE. On the question of admissibility, may I ask you this: Is it a document that ought to be in our files for reference, and referred to in the record, or do you think it ought to be included in the record?

Mr. PIERSON. I do not think it is necessary to include it in the record. I think it is sufficient if it is merely in your files.

Senator PASTORE. All right, because I wouldn't want to encumber the record any more than need be, but we shall incorporate it by reference and it will be in our files, and the record will indicate that it is in our files if anyone desires to refer to it.

Senator SCHOEPPEL. Could we have at the proper place in the record the demarcation of the instruments by name?

Senator PASTORE. Yes; would you identify them for the record? That is a very fine suggestion.

Mr. PIERSON. The first document is a joint substitute petition concerning subscription television, filed on November 29, 1954, which was a substitute petition for one filed in 1951, when this matter was first instituted at the Commission.

The second document is the comments of Zenith Radio Corp. and Teco, Inc., in the rulemaking proceedings in docket 11279, filed on June 9, 1955.

The third document is the reply comments of the same parties in the same docket, 11279, filed on September 9, 1955. Now docket 11279 was the Commission's rulemaking proceedings on subscription television which was concluded, as far as presently ordered, on September 9, 1955.

The fourth document is the comments of Zenith Radio Corp and Teco, Inc., docket No. 11532, filed on December 15, 1955.

The fifth document was filed by the same parties in the same docket, 11532, and it consists of reply comments. That date was January 20, 1956. Docket 11532 concerned the reallocation matter, the UHF controversy, and all of the proposals to modify the Sixth Report and Order of the Commission.

Now we had hoped to have other witnesses present. For one, the written statement was sent directly to the committee, that of Governor Johnson; he was unable to be here. Another witness was Ralph Bellamy, an actor, who is president of the Actor's Equity, a labor association of actors engaged in the legitimate theater. Mr. Bellamy was on location out in Hollywood and found it impossible to get here, but he did forward to me his statement. I would like to have his statement entered in the record as though presented in person.

Senator PASTORE. Without objection, we will do that.

STATEMENT OF RALPH BELLAMY

Mr. BELLAMY. In view of my long interest in subscription television I had hoped to present this statement personally, but due to other commitments I have unfortunately found this to be impossible. I would appreciate it, however, if this statement will be considered the same as if I had made it personally.

My first interest in pay-as-you-see, or subscription television was motivated by the serious lack of employment and the general economic condition of the theater, and because I am president of Actors' Equity Association, whose members are actors in the legitimate theater. An analysis of the possibilities of subscription TV with respect to employment seemed to me to reveal unlimited possibilities, not only for actors, but for all the talent pools, as well as craftsmen and technicians, and extending even to employees in the manufacturing and distribution field of television sets, and the construction and franchising of new stations.

Present programing is tied budgetwise and policywise to the national industrial economy which pays for it. Some twenty-odd sponsors control some 90 percent of the programs currently on the air. The local station owner receives desirable programing only at the discretion of the national advertiser and the networks. The viewer must select his entertainment from what is available under this system. There are two kinds of programs the viewer is being denied: (*a*) The kind that is too costly to be supported on a regular basis by an advertising budget; and (*b*) the kind that might seem to have too limited an appeal to warrant advertising budget expenditure on a cost-per-person basis. I believe the televising of Broadway plays would fall into either or both of these categories. And the possibility of such televising would certainly help to alleviate the serious unemployment condition in our membership, as well as the increasingly precarious financial position of the theater as a business.

The theater as a whole has undergone an economic metamorphosis in the past 10 years, which seriously threatens it as a continuing vital part of our culture. A play which could have been produced some 10 to 15 years ago for $25,000, now costs $75,000. And the price of tickets has necessarily increased over this period to the extent that a play must be a hit before it can attract sufficient audience to make it a good business venture. And "risk capital" in the theater is more wary than it has ever been. If it were possible to televise a play at a nominal price of from 10 cents to 25 cents per set on any kind of substantial basis, it can readily be seen that it could encourage more production and probably at the same time prolong the run of the play which is being televised.

Road shows have become almost extinct because of the economics of the theater. This shortens the extent of employment of individuals concerned in any given show, and also denies people living away from production centers the opportunity of seeing plays. It is possible that subscription TV is the answer to the road, both as a sounder basis for original capitalization of a play, and because it will take the theater from production centers to the homes of those who might otherwise not see plays.

In addition to these benefits which the theater would derive, employment of actors would certainly increase through their use in other kinds of entertainment programs, such as educational and historical programs, craft and trade programs, language lessons, musical and literary programs, et cetera, many of which would have perhaps limited appeal, but would make profitable business ventures, at a very small cost to the set owner who wished to pay for them.

I believe that the cost per set for subscription television would find its own competitive level and would not in any way interfere with present programing or the availability of star performers. The most popular programs and performers in the present commercial field would be held in that field because of their very popularity. There would be nothing to gain by their converting to subscription TV for the reason that their very popularity assures them a wider and a larger audience than they could have on subscription TV.

I earnestly hope that subscription TV will be allowed a trial. Its acceptance will be the viewer's choice, and his decision. It is highly probable that the public will welcome a wider variety of TV fare. And it is highly probable that they are willing to pay a small charge for it. We will never know if it isn't tried.

Mr. PIERSON. I would like to inquire also whether the exhibits that Mr. Kohn worked from yesterday have been admitted into the record, because I think the record would be quite unintelligible unless those exhibits are in.

Senator PASTORE. They were not, I'm informed, but the staff informs me that they are essential to the record. Is there any objection to their being included in the record?

Senator SCHOEPPEL. I think they ought to be included in the record.

Senator PASTORE. Without objection, so ordered.

(The exhibits referred to are set forth following Mr. Kohn's testimony, starting at p. 1129.)

Mr. PIERSON. If the committee please, there are a few distinctions in the proposals and the positions of the proponents. I do not think it is important that they be emphasized here, except to the extent that they may provide somewhat different answers to questions that have been raised by the committee, so I would like to limit my discussion, which will be very brief, to those distinctions which it appears, from questions asked so far, would provide a different type of answer than was indicated by the other proponents. Now Zenith alone among the 3 present proponents, or 3 present owners of a system, proposes to lease its equipment to the subscriber. Both Telemeter and Skiatron testified that they intended to sell them for a price of from $40 to $45. Zenith proposes to install the decoder in the subscriber's home for an installation charge which, under our best estimate, ranges somewhere around $4, plus a charge per month for having the equipment in their home. Now the best estimate that we have been able to make to date as to that charge is $1 per month. Also the arrangement with the subscriber would be that he can terminate that service at any time.

Now the reason I think this provides a somewhat different answer from the proposals of the other two proponents refers to questions asked yesterday by both Senator Potter and Senator Bible. Senator Bible, I believe, particularly wanted to know what assurance, if he paid $45 for this gadget, that he would get any service out of it at all, and wasn't the public likely to be very seriously damaged, at least in the early stages before it is an established service, by these expenditures. That was one of the reasons that Zenith felt that the investment to the public should be kept at a very small amount until the service is fully established; and, of course, no one can predict today whether this thing will succeed or fail, and it was our feeling that the public should be protected in that interim period.

I should add, in candor, that there were other reasons that were purely business in nature that dictated the desirability of controlling the equipment, in terms of service, in terms of a collection instrument, so that if a party did not pay, for example, what he owed for the programs that he took, you could remove the instrument itself and it would still be your property. So the maximum, I would say, gamble that anyone would take on this service when it starts would be between $5 and $6. That would be the most that they would be committed in terms of funds.

We have also proposed that the Commission prohibit the use of advertising on subscription television. We feel that the industry, if it ever develops—the subscription television industry—would not be too wise in inserting advertising, and certainly as far as Zenith is concerned we would like to see it prohibited to preserve the full quality of the product, for one reason, and second, because 75 to 85 or 90 percent of the time is going to be available for advertisers and that revenue, and that use should go into the free time and not the pay time.

Senator PASTORE. May I ask you a question at this point?

Mr. PIERSON. Surely.

Senator PASTORE. If I understand you correctly, Zenith would own the equipment and would have an agreement with the subscriber to service it and to pay a rental for it. Let's assume that I became dissatisfied with the equipment of Zenith, could I still get paid subscription television by going to Mr. Poller and doing business with him, or where am I?

Mr. PIERSON. As I understand, Mr. Poller does not have a system. As I understand the proposal, from his statement this morning, is that he intends to be the broadcaster. He wants someone else to put in the actual subscription television system. Now what Zenith proposes, first, is that the Commission permit all owners of systems—this would be Skiatron, Telemeter, Zenith, and even RCA, if they have got one locked up somewhere—to enter into any market and put in their system. We propose that our system will be available for use by any broadcast station in the community that is authorized by the Commission to engage in subscription television. We propose also that our charge will be the same to any broadcasters who use it. In other words, our charge must be nondiscriminatory.

Consequently, the subscription system, in the manner that we propose it, would not be engaged itself in telecasting, except in the initial stages as strictly promotion. It would probably not be engaged in the procurement or distribution of programs. All this system is is a service that it furnishes to two people: a broadcaster who has program product that he wants to get to the people, and people that want to see his program product, and product that would not otherwise move through the television system.

Now this brings me to a question with which Mr. Poller was dealing.

I think some of the questions addressed to him overlooked the stage at which we now are in subscription television. It is not an industry. It is yet unborn. It has been laboratory perfected. Technically it has been field tested. Now I think it is beyond the capacity or the prescience of any individual or group of individuals—no matter how well informed technically or economically or in this industry—to determine as a fact whether the competition will be sufficient to protect the public as to the price; or if it is not, what measures you would have available to determine what regulations should be made. Because if you want to set a rate to protect the public, we presume it would be a rate that would be an intelligent rate and would follow the purposes of most ratemaking, namely, not to kill the service, but to make sure that the business exists and that the person operating the business does not get an unconscionable return, being in a monopolistic business.

Now the facts that would be necessary for any ratemaking body following classical ratemaking procedures cannot possibly be determined today, because there are no facts. There is no empirical knowledge of any kind as to what this will do. Our position before the Commission has been this: We cannot at this time conjure up all of these facts. What will happen, a proponent thinks, is very beautiful and rosy—an opponent thinks it is very bad. I submit none of us know because it is a fact we have not been able to learn. We have asked the Commission for this one privilege, and I claim it is an ordinary and common American right—to start with this service to the public, obtain the empirical knowledge and the experience that is necessary to determine, (1) whether we as a business are making a wise investment to continue it, and (2) whether if we do, certain abuses or evils have been shown to exist that will require regulation in this area or that area.

Now I submit that only then can intelligent regulation be applied. And I submit that the reason that it cannot be now is because the facts are not established, and will not be.

Senator PASTORE. Well, I follow you very clearly, Mr. Pierson, but then wouldn't you subscribe to this argument, also? Maybe I put that wrongly, about subscribing to it. I do not want anyone that represents an interest here to subscribe to anything that might be somewhat in opposition to his position. But look at it this way, let me say: Here you have a service that is being rendered to the public at large on a gratis basis. Substantial arguments are being made before the Federal Communications Commission—and they are going to be made here, if they haven't already been made—that the tendency, or the likelihood, exists here that this new medium of service to the public, of paid TV, might in some way affect the bounty that the public now enjoys on a gratis basis; and that if this became to prevalent, it might well mean that the quality of entertainment that is now being enjoyed by the average viewer might be somewhat injured or affected.

Now were that problem facing the Congress, and the issue facing the Federal Communications Commission—which is a substantial question—you say that will never happen. You are talking about prognostication. Look at the prognostication that is going on right on this issue. You say you are going to help the industry. Those who are opposed to it say you are going to ruin the industry. So even there we do not know the answer. We are in a nebulous state as it now exists.

Mr. PIERSON. Right.

Senator PASTORE. Well, now, because of all of these uncertainties, don't you think there ought to be some type of supervision on the part of the FCC, not in any specific formula of rate of return, or what have you, because it might be hard to judge it now, and you might not reach the right formula; but somehow there ought to be some strict supervision so as to hold these two conflicting interests in balance so that the public will not be injured.

Mr. PIERSON. I am in full agreement.

Senator PASTORE. Now what it is going to be, I do not know, but I do not think we can say that free competition will do it.

Mr. PIERSON. I have never understood, Senator, that any proponent proposed anything else, and much less have I ever understood that the Federal Communications Commission, conscious of its responsibilities, would turn this thing free and let it go its own way with never a care as to what was happening, or what they were doing. But you must remember this: that when the Government says we can enter the market place, it is going to be a substantial period of time—and I probably should add, if ever—that we will be in 2, 3, or 4 markets in the country.

In the first place, to equip a market with 100,000 receiving sets, to give this thing a fair test—assuming that is—I would judge that it would be well toward the end of a period of 2 years before one market was established in that fashion by a single proponent. Now, it might be possible toward the end of the 2 years to have started in a second market. If you take the present 3 owners of systems, that would be 6 markets in the country.

Now I have assumed that, through that period of time, the Federal Communications Commission will be very carefully watching what develops, and they have proposed that their authorization for this initial period—whether it be 2, 3, 4, or 5 years—be tentative and supervisory in nature, so that during that period of time this committee, as responsible and sensitive as it is to all problems involving the public and broadcasting particularly, and the Commission, with the same sensitive responsibilities, will be quick to move, and will have much time to move while they are getting facts—not just someone's speculative predictions that are colored, consciously or unconsciously, by their own interest in the matter.

Now I can tell you frankly I do not believe that the things that they predict will come true. I cannot think of tougher competition for anyone going into business than competing with someone who is giving something free. I cannot think of any tougher competition, with reference to price or to quality of product or the value of your service, but I must admit that even if I tried to be objective, and as an advocate I probably have not that particular office——

Senator PASTORE. I have always found you at least attempt to be objective, let me say that, Mr. Pierson.

Mr. PIERSON. Thank you, I must admit that you are no more entitled to believe me than you are them, and I cannot prove to your satisfaction that they are wrong, and they cannot prove that I am wrong—but experience will. The important factor here is that while that experience is being gained there will be governmental bodies who will be supervising it and watching it diligently, and I do not think the public is going to suffer even if we are pirates, because I do not think the members of the Commission or this committee would permit it.

Senator PASTORE. Well, I am very happy to hear you say that, and I repeat again, naturally there are so many uncertainties involved in this situation that it is pretty hard for anyone. If you ask me, "Well, all right, what should the formula be?" I couldn't answer that question, and if we had to call in experts we might have to call in the same people who are addressing us now who are not in a position of knowing because the facts have not been developed through experience.

But, on the other hand, there ought to be some broad authority on the part of the FCC whereby they would be in constant touch with this and reports would be made as to the progress, so that the Congress would be apprised, and the public interest of the situation as it develops from day to day, so that ultimately, if any regulation should be made, it can be done judiciously; and, on the other hand, if it should not be made, it could be explained to the public why, in the public interest, it should not be undertaken.

That is all I am saying. I am not too much impressed that there is going to be so much competition here that competition is going to take care of it, because just as you say, we are all more or less swinging in the dark here, and what competition are you going to have here when we don't even know what the competing forces are.

Mr. PIERSON. You see, Senator, my great concern is I know, were I an advocate on the other side, that I would urge the Commission, and this committee, never to let this get off the ground until all of the evils have been discovered and regulations have been adopted to avoid them. And the reason I would advocate that is I would know that it would be impossible for it ever to get off the ground, because the condition that they impose for its start is absolutely impossible of human attainment. That is why I want to emphasize that we do not preclude proper Government control.

For example, the application from Allentown that Mr. Kohn spoke about yesterday, and a copy of which was filed in the record, had provisions for extensive weekly reports to the Commission on every possible phase of the operation, and I just cannot assume that the Commission would not deal intelligently with that material. Zenith obviously will do the same thing, and I am sure that every telecaster is under an obligation to furnish such reports as the Commission demands.

Senator SCHOEPPEL. Well, Mr. Pierson, what you are saying—and what I understand you would have no objection to seeing done—would be that the Commission, or the proper agencies of the Government, retain jurisdictional control—or regulation, maybe I should say, a better word—during this trial run period, during which period of time facts and circumstances and scientific data will be available, reportedly available, openly available, for the purpose of seeing if regulation is needed to curb some evil results or monopolistic tendencies.

Mr. PIERSON. Yes, Senator, that is precisely our position.

For example, the first transcontinental railroad was completed in 1869, but we didn't have the Interstate Commerce Act until 1887. Now, it would be interesting to know what would have happened to that development if, before they could lay the first track, they had to anticipate all of the regulations that would be necessary. It was impossible; and no one stopped the Wrights from flying at Kitty Hawk until they showed all of the CAA regulations and the laws that would have to be passed.

As a matter of fact, the networks started in business in 1925 before we even had a law regulating the industry. Now, also at that time, advertising started taking hold, and was used as a means for support. Now, Mr. Sarnoff didn't suggest that it should be an issue in a presidential election, or that we should have a detailed study of what regulations of networks there should be, or what regulations of advertising; and no one can say from hindsight that you couldn't have predicted evil along with the good.

It was 1939 before evils grew in the network industry that required Government to act. In 1943 they finally effected regulations, and those regulations were designed to meet the evils established by facts that were then existent.

Now, the mere fact that something may require a future law or a future regulation does not mean that we should not do it. That is a denial of progress. That is a refusal to meet the challenge of the new, and we certainly are conceding, and are in no way maintaining—we are not maintaining that it will never be in a position to require some type of regulation. We are maintaining that no type of regulation can be adopted until we have some experience, and the only purpose of those suggestions is to make sure that we never get a start.

Senator PASTORE. Well, I subscribe to that completely, and all I desire to say in rejoinder is this: I am pretty well convinced—after all, I have been at this for a couple of years on this UHF and VHF problem—and I am pretty well convinced that had we had the vision in the early stages to step in at the proper time, much of the abuses that have developed would not exist today. And we don't want that to happen here. Had the UHF–VHF situation, and this whole business of concentrating 7 stations in 1 area, been avoided from the start, we wouldn't be in the trouble we are in today. And we want to avoid that before it happens, because once it happens it is pretty tough to return to the status quo ante.

Mr. PIERSON. I think, Senator, the type of supervision that you and Senator Schoeppel have discussed will adequately avoid any such repetition of those problems.

Senator PASTORE. You may proceed, and I want to thank you for the observations you have made, Mr. Pierson.

Mr. PIERSON. Senator Potter, and I believe Senator Bible, yesterday both inquired as to the charge that would be made of the viewer, and I believe there were some questions of the chairman this morning in that connection.

The one thing that I think perhaps has not been made too clear, is that in the proposal so far we are not comparing a dollar paid in the home to a dollar paid as admission to a theater. In other words, when we speak of charging a dollar for a feature picture on subscription television, we have no control over the number of persons that see it—it can be 4, 5, 1, 10, 15, or 20.

Now, you cannot determine the charge per person until you know precisely how many people would see it. When a theater charges, or a ball park charges, they charge on the basis of each person. Now, I would say if it cost you a dollar to go to the movies, and we charged the same dollar at home, and an average of 4 or 5 people in the family saw it, we would get down to a figure of 20 or 25 cents. I think there has been a tendency to use the theater frame of reference of per person admission when we are dealing with a per home admission which may involve any number of people.

Senator PASTORE. Well, now, another question, and this to me is very important, Mr. Pierson.

You have a mechanical apparatus that is affixed to your television set that unscrambles a scrambled picture, and gives you a clear picture.

Now, on this question of the competition in the field, and the right of choice on the part of the viewer, how many of these services are existing today, or do you have a patent on that particular type of apparatus so that, unless they use your apparatus, they cannot see it?

Mr. PIERSON. Of course, there are none existing today, but the systems that have been developed—Zenith, and Skiatron, and Telemeter—each have filed patents covering their particular systems.

Now, we have patent rights on our own system, and they claim patent rights on their systems. As far as I know, the chances of any one of us coming out on top is going to depend much more on the effectiveness of our system than on any patent protection; and in any event Zenith proposes to permit, for instance in the manufacture of the equipment, to freely license the manufacturer of the equipment. They propose to grant franchises for its use. They are not going to operate it themselves. They will operate it on a franchise basis.

Senator PASTORE. But can you move from one to the other and still see the program? That is the point I make. Will there be competition in there? For instance, you said you are going to charge a dollar a month. Now, is there someone else that might come along and say, "Look, if you take mine and don't take Zenith's you will see the same picture and I will charge 50 cents a month." Will there be that competition?

Mr. PIERSON. I think there will come competition between systems. This is only for the technical perfection. The competition for programs will come from the stations competing with each other. I assume there is some limitation upon the amount any family will pay in a week for subscription programs. The tests in Chicago indicated a dollar and a half. Now, if you have 3 stations each putting on 15 hours a week of subscription programs, they are each competing for that dollar and a half average from that home. Now, it is not competition that is restricted to a certain given time, because one station may be putting on a motion-picture feature, and the other a sports feature, and the other the Metropolitan Opera. Now what the family has to decide, having a dollar and a half, is which one of those will it take in this particular week, and it could happen that those 3 programs are all on 5 nights. They are not competing in terms, spatially, with each other, in terms of time. They are on different nights. The expense competition is from the program producers and broadcasting station owners, in inducing the subscriber to spend his dollar and a half on their programs. And, I believe, again with the color of advocacy probably offending my vision a little bit, but this is why I believe that there will be competition among programs and among stations.

Senator PASTORE. But merely to get this on the record, because I anticipate these arguments being made, let us assume that you put your apparatus on 75,000 of 100,000 television sets in one community, and you charged them $1 a month. Those people are receiving that service. Now, when you have reached this point of 75 percent, leaving only a residue of 25 percent for the other competitive service, let us assume that you decided on your own to raise the price to $5 a month. What is my remedy, just to say "All right, take it out?" What do I do about seeing this pay television; where do I go?

For instance, like the telephone in my house. If I become dissatisfied with the rate it is a case of pay the rate or do without. Now, is that what is going to happen here?

Mr. PIERSON. Well, if we have a prior assumption that any intelligent businessman would so reduce his subscribers by increasing the price constantly——

Senator PASTORE. But you already have them.

Mr. COX. Didn't you install this under a written contract originally?

Mr. PIERSON. Yes; but I say this: Just like Gillette sells its razors almost at cost to sell the blades, we are not going to make our profit out of the monthly charge for the machine, to have it in the home. We want to make the lowest possible charge so we will have as many people as possible put the equipment in that will enable them to receive this program that they want to see.

Mr. COX. Where, precisely, will Zenith get its return—in royalties on the manufacture of decoders?

Mr. PIERSON. Well, Zenith anticipates its major return in term of royalties from the franchise holders who use the equipment or use the patent.

Mr. COX. Is this, then, going to be a percentage of his gross, net, or some agreed basis?

Mr. PIERSON. It hasn't been refined that far because it is hard to figure out what kind of arrangement you will make when you are dealing unilaterally. We know what we might want from the franchise holder, but we haven't been able to sit down with any of them and see what they would require from us, and it is essentially going to be a question of bargaining, and I have no real grasp. I don't know how we can get a determination.

I will say this: The return to Zenith from the franchise holders' take, or from the subscribers, will be a very, very small percentage of the total, obviously.

Mr. COX. The franchise holder will be getting his return simply for the continued maintenance of the service and the continued encoding service he performs for the broadcast stations?

Mr. PIERSON. That is correct.

Mr. COX. And he has certain expenses in connection with that?

Mr. PIERSON. Yes.

Mr. COX. And these must be deducted from whatever override he gets on the program charge?

Mr. PIERSON. I would say our principal cost would be the amortization on the equipment. Because in Washington, where there are 600,000 television homes, if you assumed 50 percent were subscription television homes, it would cost $15 million to the franchise holder to get the equipment for all of them. His principal cost is going to be the amortization figure which may be in the early years, 3 or 5 or 8. Now, the rest of his cost is going to be primarily in collections and what promotion he does with his subscribers to let them know what shows are coming on.

Senator PASTORE. Well, isn't the system somewhat like the service charge on a gas or electric meter that you are talking about?

Mr. PIERSON. Yes, it is. Except Zenith doesn't propose to use a metering device. It has one.

Senator PASTORE. I know that, but I mean what you are going to do is actually sell the programs, over the course of a week; and they receive this program by the use of this apparatus on which they pay a service charge while it is in the house; and then, in addition to that service charge, will they have to buy the program, too?

Mr. PIERSON. Well, each program has its own charge in addition to that.

Senator PASTORE. In addition to the charge for the apparatus?

Mr. PIERSON. We have spoken of charging them initially maybe $4 or $5 for installation, and then $1 a month, which would amortize the equipment over 50 months. It may well be, since our interest is to encourage as many people as possible to put in this equipment, that we will make no installation charges or even a monthly charge.

Senator PASTORE. But this is what I would like to get on the record, if such is the case. If you go too far with this subscriber, there is always the likelihood that he could ask you to take the whole equipment out and go to somebody else's equipment. Is that there?

Mr. PIERSON. That is correct.

Senator PASTORE. That is what I am trying to establish. Is he stuck with what he has got, or can be, at any time, say, "Look, you have gone too far, and I think I will take somebody else's equipment and see the same programs"?

Mr. COX. He can do this only if there is a Telemeter or Skiatron or RCA franchise holder in the area who has the equipment available and has made the arrangements with a broadcaster to provide programs encoded in that system.

Mr. PIERSON. That is correct, Mr. Cox, but I would think, operating as a franchise holder, my greatest fear would be—let us assume that I am at this time the only one in the market. The greatest fear I would have, having that nice cozy little situation, would be that I would so abuse the public and overcharge it, that I would plow very favorable ground for bringing Skiatron and Telemeter in.

Now, maybe my idea of a wise businessman is wrong. Maybe I cannot understand it. I don't think they would do that, but if they do do that, and if they do abuse the public, and the competitors do not jump in the breach when they are abusing the public, to take over their business, it is at that point that I am very satisfied that the Commission and the Congress of the United States would act to protect the public.

Mr. COX. I think the record perhaps should show this: Who actually, in this setup, would determine the price to be charged to a viewer for a particular program? Is it going to be the franchise holder or the telecaster over whose station the program is broadcast?

Mr. PIERSON. Well, it seems to me the major responsibility for price must rest with the television broadcaster, because he is the one who must procure the product. He knows its cost. He is the one competing with other programs, and other broadcasters.

Mr. COX. He buys a product from a program source. He buys a service from the franchise holder. He has his own costs and profit to be concerned with. And based on all of these considerations, he determines a price which also must reflect his competitive position vis-a-vis free television and other forms of entertainment media with which he must compete.

Mr. PIERSON. That is correct. I think he would be the major determiner of the price.

Senator PASTORE. But before the viewer could go from one system to another, there would have to be a new broadcasting network; wouldn't there?

Mr. PIERSON. I am not sure I understand, Senator. You mean there would have to be another system?

Senator PASTORE. Another system, from production to reception.

Mr. PIERSON. No.

Senator PASTORE. Well, at what stage, that is what I am trying to determine?

Mr. PIERSON. I have assumed, first, that no broadcaster can possibly be committed to use only Zenith's system, that a broadcaster will pick, for any program he has, a system that he thinks will bring him the largest return in his community. Now, since that is true the broadcaster will determine on the basis of each program, if they are competing systems, which system he will release it over.

Assuming that, in Washington, Skiatron and Zenith both had systems in operation, and Zenith had 300,000 homes, and Skiatron 400,000 homes, I would suspect that the broadcaster would select the Skiatron system.

Senator PASTORE. But there couldn't be the two?

Mr. PIERSON. The same program simultaneously over two systems, no, because the scrambling and unscrambling methods are different.

Mr. COX. You have supposed, there, that you would have more decoders in existence than there are television homes in the area. Is it possible to have a set equipped to receive more than one system at the same time?

Mr. PIERSON. Oh, yes.

Mr. COX. That is, if there is space on the back of the cabinet you can install 3 decoders on 1 receiver?

Mr. PIERSON. Well, I think the thing that goes on the back of the cabinet for Zenith, by the time we hope to get into operation, can fit in your coat pocket. It is larger than that now.

Mr. COX. How about the connections? Isn't it possible that some of these systems connect at either the same point in the internal mechanism of the receiver or at a point so close that it would create interference, shortings, things of that kind?

Mr. PIERSON. I don't know whether there is a problem of connections, personally. I remember Mr. Raibourn's engineer yesterday stating that there would be no problems, and I can't dispute it. I suppose he is correct.

Mr. COX. As a simple matter, though, of overall economics, assuming that the system first in the market was wisely administered, wouldn't the natural tendency be that Community A would have one system—Telemeter, Skiatron, or Zenith—and that the competition would be for communities rather than within communities?

Mr. PIERSON. I think that is almost undeniable, as nearly as we can speculate how this thing will come about.

Mr. COX. It would be economically wasteful to try to superimpose one on the other in the same area?

Mr. PIERSON. I believe that is correct, and I certainly think this is true, that the public is not going to live with much inconvenience. They are not going to hang a lot of gadgets around their set if they don't want to.

It may well be when this thing settles down, in 5 or 10 years, that you will find each community having a single system. At that point it may well then be necessary for the Government to say, since the broadcasters and the subscribers have only one system available, "We must regulate just so much of this price as is under a monopolistic control; namely, the price that the franchise holder charges."

Now, that doesn't mean that the television station has to be regulated in any of its operations because it is a customer—just like now you regulate the telephone company, but the fact that the networks and the broadcast stations use the telephone company doesn't mean that you have to regulate them, also.

To me that is the area that is most likely to require, ultimately, common carrier regulation, and then this, I claim, cannot be established for certain cities in advance. But one who has the system, and it is the only system in the market, and everyone must use that system, broadcasters or subscribers, or do without. Now I think there is the field where it is most likely that regulation would ultimately be needed. But I think we can afford to wait as long as the railroads and the networks did.

Senator PASTORE. The reason we keep asking these questions is not to satisfy our own minds, Mr. Pierson, but to make this record as complete as we can in order to develop any questions and answers that may be asked later on.

Mr. PIERSON. I believe that that fairly well concludes my 10 minutes.

Mr. COX. I have one question. In your comments filed in the Commission's allocations proceedings you suggest that initially, at least for a period, I believe, of 2 years, that the Commission's authorization of subscription service should be limited either to UHF stations or to VHF stations which are in financial difficulty, and propose as an empirical test their receipt of less than 7½ hours a month of network programing; is that correct?

Mr. PIERSON. That is correct.

Mr. COX. Now, do you suggest this as a possible way in which UHF television could be rehabilitated, through giving it a headstart on this additional source of revenue?

Mr. PIERSON. That is correct, plus, I think, Mr. Cox, it was a bit of realism on our part. I am satisfied if subscription television started tomorrow it would be a long period of time before any basic network affiliate would give up its first half hour or hour to subscription television. If an independent producer cannot get in with a free program, and a local advertiser cannot get in with his program, and the local organizations cannot get in with theirs, I don't think, the way they start out feeling about us, that any network affiliate would chance a loss of his network affiliation by accommodating our requirements for time.

Now, secondly, I think that there is a basic conflict between time requirements of a network and subscription television in terms of the hours when no station could really accommodate both. We felt, therefore, that it was a certainty, without any regulation or restriction by the Commission, that we would have to get along initially, and probably for a long time, and probably for all time, with the stations that the network don't want, with the ones they cannot support. With apologies to those stations, I think we must in effect use the network rejects.

Now, since this is true, we certainly do not have any objection to a regulation that will face up to that reality and puts no greater limitation upon our ability to do business.

Now, the reason we did not limit it specifically to UHF was this: We felt that our greatest contribution to the industry, and the one upon which we pin our right to use a television channel, is that we can increase the number of stations in the country. Now, there are many areas in which local expression under the allocation plan, and a new station under the allocation plan, can only be established if it is on VHF. In other words, in Governor Johnson's State of Colorado, in Senator Schoeppel's State of Kansas, a great number of the stations that are not on the air are VHF.

Now, I think that what we wanted to do was have the opportunity to establish a new station wherever the networks and the national advertisers had given up, and were not doing the job.

Mr. Cox. That is long range, though, of course.

Mr. Pierson. Yes. For the immediate 2-year period, since I cannot conceive of there being more than six markets involved, I don't think that makes much difference.

Senator Pastore. Well, on that point, if you will permit me, Mr. Cox, what do you mean, establish new stations? Take Providence, for instance; we have two VHF stations. We did have a UHF, but it is off the air. Now, how would this work in with Providence? I just cite that as an example.

Mr. Pierson. As I understand the situation in Providence—and I am not sure that I am fully informed or accurate about it—the third station, the UHF station, went off the air in Providence because it couldn't get sufficient revenue, and I understand that resulted primarily from their inability to get a network affiliation. Now, the thing is, there was obviously a conversion problem which I understand they were well on the way to meeting when they ran out of money. Now, I would suggest that subscription television on that local station would supply the revenue that they cannot get from the network, and then with local advertising revenue, the station would become economically feasible for operation.

Senator Pastore. Well, would it be a VHF or a UHF? It would be a UHF?

Mr. Pierson. As far as we are concerned, it could be either. The right to use our system would depend entirely, under our proposal, our initial proposal, on whether they needed it in order to continue in operation, whether it is V or U.

Senator Pastore. Well, I mean, is there something in your plan of pay television that is completely divorced from the technical setup in the network itself, which would allow an additional station to come in if it were exclusively devoted to pay television without disturbing all of the other technical problems of existing stations?

Mr. Pierson. That is precisely our proposal. We say that we should be permitted to use those stations which now are not economically feasible to operate, and all new stations that come on the air, figuring that our very economic support would bring new stations on the air.

Mr. Cox. But those would have to be stations that would operate on channels allocated, or to be allocated, to those areas by the FCC?

Mr. PIERSON. Well, they are already allocated. In most instances they are UHF channels. In one instance like in Garden City, Kans., I believe they have a VHF. I think just because Garden City did not have the good fortune to get a UHF assignment, if this thing works they should still be permitted to have a station there, even though it is VHF.

This is a long term, as Senator Pastore pointed out, or you, Mr. Cox. I think, immediately, there are enough good test markets or trial markets, since we would not be concerned with more than 4 or 5 or 6 in the first 2 or 3 years in any event.

Mr. COX. But how much help can that give to struggling UHF broadcasters, if you can only hold out hope to them that 6 or 8 of them are going to be benefited by this in the course of next 2 years?

Mr. PIERSON. I think Mr. Kohn answered that yesterday when he said even if he weren't the first one to get into business—which I believe he devoutly hopes, and I sort of hope, too—it would give them hope, and as he says it, they would hang onto their CP and they would see a hope in the future of a valuable facility. But this is what disturbs me about the proposals to go into all kinds of considerations of regulations, and have all sorts of other proceedings, because this thing can be killed easily with procedure. Certainly there can never be an earlier time when it will help UHF.

Mr. COX. But as a practical matter at present, even its immediate adoption would not be, in and of itself, a complete solution to the problem of maintaining UHF as an integral part of our broadcasting system?

Mr. PIERSON. I think it would be a very substantial solution if, in the initial operation, it showed that there was a great source of revenue for any existing or prospective UHF stations that wanted to go into operation.

Senator PASTORE. But the sum up of that argument is the conclusion that, after all, you are not taking anything away from what is already existing, you are willing to gamble on the chance that there is UHF that is seriously faltering for economic reasons, and you are perfectly willing to send your shows over these particular stations because you feel that you are willing to take that chance in order to build them up and because your product is going to be such an attractive thing to the public itself.

Mr. PIERSON. Precisely.

Senator PASTORE. We will adjourn until 2 o'clock tomorrow.

(Whereupon, at 12:45 p. m., the committee adjourned to reconvene at 2 p. m., Wednesday, April 25, 1956.)

TELEVISION INQUIRY

WEDNESDAY, APRIL 25, 1956

UNITED STATES SENATE,
COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE,
Washington, D. C.

The committee met, pursuant to adjournment, at 2 p. m., in room G–16, the Capitol, Hon. John O. Pastore presiding.

Present: Senator Pastore.

Senator PASTORE. We have three witnesses on our list today: Mr. Marcus Cohn, Mr. Abe Stark, and Mr. Harold Fellows. I will address myself to Mr. Cohn first. Is he here?

Mr. COHN. Yes, sir, I am.

Senator PASTORE. How long do you expect to be, sir?

Mr. COHN. Forty-five to fifty minutes, sir.

Senator PASTORE. Forty-five to fifty minutes. Is Mr. Abe Stark here?

Mr. STARK. Yes, sir.

Senator PASTORE. Mr. Stark, how long do you expect to be?

Mr. STARK. I would say about a half hour or less.

Senator PASTORE. Mr. Harold Fellows; is he here?

Mr. FELLOWS. Yes.

Senator PASTORE. How long do you expect to be?

Mr. FELLOWS. I would say about 20 minutes.

Senator PASTORE. Well, I think we ought to finish up comfortably by 4:30. All right, Mr. Cohn, we will hear you first.

STATEMENT OF MARCUS COHN, COUNSEL, COMMITTEE AGAINST PAY-TO-SEE TV

Mr. COHN. My name is Marcus Cohn. I am a member of the law firm of Cohn & Marks which represents the Committee Against Pay-To-See TV. This committee consists of independent motion-picture exhibitors scattered throughout all of the 48 States in the United States and represents approximately 75 percent of the 16,000 exhibitors in the United States. This commiteee is part of a national group, Organizations for Free TV, which consists of various types of organizations: Chambers of commerce, American Legion posts, women's clubs, small-business associations, theater groups, radio and television station owners and employees, labor unions, and trade associations, as well as individuals who, on their own behalf, believe that people should not have to pay to see television programs.

The Committee Against Pay-To-See TV has actively participated in the subscription television rulemaking proceedings at the Federal Communications Commission.

I have previously sent to each of the members of this committee, as well as its staff, copies of the various documents which we have filed with the Commission, and at this time, Senator, I would like to ask that there be incorporated by reference the documents which we have filed with the Commission.

Senator PASTORE. Just a moment, is this just by reference?

Mr. COHN. Yes, sir.

Senator PASTORE. All right, and then what you will do is identify them on the record?

Mr. COHN. All right.

Senator PASTORE. You needn't do it, our staff will do it for the stenographer.

(The documents above referred to are as follows:)

1. Opposition of Joint Committee on Toll TV to joint substitute petition concerning subscription television of Zenith and TECO, filed January 6, 1955.
2. Comments of Joint Committee on Toll Television (Committee Against Pay-As-You-See TV) filed June 6, 1955, in FCC docket No. 11279.
3. Reply of Joint Committee on Toll TV to comments filed by subscription television proponents, filed September 9, 1955, in FCC docket No. 11279.
4. Reply of Joint Committee on Toll TV to comments of Zenith Radio Corp. filed February 8, 1956, in FCC docket No. 11532.

(They have been retained in the committee's files and are incorporated in this record by this reference.)

Mr. COHN. In connection with the statement which I have distributed, I do not propose to take up the last 4 pages, beginning on page 17. That is a digest of the legal problem involved insofar as the Communications Act is concerned. In our comments to the Commission, we have exhausted that subject considerably and this was only an attempt to digest it, and I don't think in the light of the questions or the interest of the commitee on Monday and Tuesday, it is particularly pertinent here today.

Senator PASTORE. Well, it is to me, though, because I am very much intrigued with that element of the discussion. Tell me just a brief résumé. What is your opinion, the legal opinion, on the Communications Act as to pay-as-you-go television?

Mr. COHN. We believe, one, under the Communications Act of 1934, as amended, it was not Congress' intent, and the Communications Act does not provide for the type of service which the subscription television people are offering, or attempting to offer, to the public, and to this committee and the Commission today. It is neither, on the one hand, broadcasting, which is one type of service under the Communications Act, nor is it common carrier which is really the other type of commercial operation authorized by the Communications Act.

It is both broadcasting and common carrier and yet neither. It is really a hybrid of both, and I don't think in the history of the discussions on the act, itself, or any of the amendments, was it ever contemplated that this type of service would be authorized by the Commission through the delegation of power from Congress.

Senator PASTORE. But you draw your conclusion from inference of the intent of Congress with reference to the act itself. Is there any specific prohibition in the law?

Mr. COHN. There is no specific prohibition in the law as such, sir.

Senator PASTORE. And it is your opinion, therefore, that before it could be permitted, an act of Congress would have to be passed to amend the law?

Mr. COHN. That is correct.

Senator PASTORE. All right, sir, now you may proceed.

Mr. COX. I would like to ask this question, Mr. Cohn. Isn't it true the Federal Communications Commission has authorized one service, functional music, which the majority of the Commission regarded as neither broadcasting nor common carrier?

Mr. COHN. That is correct, and it authorized as subsidiary service of an existing FM service. Insofar as that is concerned, we cover that exhaustively in the comments which we filed with the Commission, where we point out that that really is not the basis upon which you can authorize subscription television today.

Mr. COX. I would assume that in the proceedings now pending before the Commission, this would be the initial question that the Commission would have to decide, and that following such a decision, the accuracy of its legal conclusion could be challenged in the courts if anyone were so inclined.

Mr. COHN. I think that is true.

I. BACKGROUND

Radio and television broadcasting, as we know it today, is the rendition of a free program service intended for the general public. On both Monday and Tuesday there were witnesses who testified before this committee that television today is really not free, that you pay for it by buying a Mercury car—that was one of the illustrations—or another product of advertising. I think it is an accepted common fact in economics that as the mass production of items increases, the unit cost goes down, and what has actually happened through free television is that the cost of products, each in competition with the other, has gone down on a per-unit basis.

It may be true that indirectly you are contributing to advertising, but at the same time you are raising mass purchasing power and mass distribution of commodities. It is also important to bear in mind that television today is as free as the public parks, and you don't have to buy popcorn when you are in the public park. You don't have to buy a Mercury if you don't want to. You can either buy it or not, or you can buy a competitive car.

It is free in the sense that there is no direct charge to the viewer and in addition to that——

Senator PASTORE. Well, I don't think any member of the committee seriously is going to subscribe to the argument that it is not free.

Mr. COHN. I am very glad to hear you say that, Senator, because that is the contention that Zenith has made before the Commission and one of the arguments made here yesterday.

Senator PASTORE. It is one of the arguments. I don't think the whole issue rests on that. You turn on your television set as you please and you buy the product if you want. It is still free as far as I am concerned. I think most everybody looks at it that way.

Mr. Cox. Of course, it is true that if you buy the product and don't watch the program, whatever indirect contribution you referred to is made whether you are getting a program in return or not.

Mr. COHN. That is correct, but on the other hand, by the use of the advertising, the per unit cost is considerably less than it would have been otherwise.

Mr. Cox. That is true only so long as advertising serves to increase overall consumption and not to the extent that it is devoted to simply trying to capture a larger share of an already saturated market.

Mr. COHN. That is true.

The public listens and watches as it sees fit—without regard to its income level. Programs are enjoyed and shared equally, on the same basis, by the farmer in Kansas and the Wall Street broker, and I might parenthetically add by the disabled veteran in a hospital. These two media—just as our free public schools and libraries—have established themselves as indigenous characteristics of this great democracy. As I travel around this country and our neighboring countries to the south, I am always struck by the large number of television receiving antenna which one sees on the lower economic income homes.

Subscription television is nothing more nor less than an attempt to install a turnstile in every television home; put differently, to charge an admission fee in order to go through Rock Creek Park or view the Lincoln Memorial. Its ultimate objective is to force the public to pay for what it is presently receiving free.

I think it is important to bear in mind that the subscription television proponents are not interested in establishing, and do not propose to establish, either new stations or a new program service. What they want to do is to use and profit from the stations—and the programs—that are already established.

Mr. Cox. Well, as I understand their testimony, they propose to do both of those things. Now you may argue with whether they can deliver on the proposal, but it is my understanding that they wish to provide types of programs which, in part at least, are not offered on a regular basis by existing sponsored television and that they hope that this method of additional raising of revenue will make possible either the continued existence of stations now in financial difficulty, or the ultimate encouragement of additional stations.

Mr. COHN. I was struck by the fact, Mr. Cox, that as far as Zenith was concerned yesterday, it didn't deal with the issues at all involved in this particular question which you have posed to me, and you have nothing before you as far as their position is concerned, outside of what they have told the Commission, incorporated here by reference, as to what types of programing they really intend to bring to the American people.

I think I will demonstrate in the course of my remarks that unless they are businessmen of the astuteness far less than I really believe they are, the only types of programs which they intend to bring to the American people are the most popular, with the greatest mass appeal. The specific reference to the new stations that I had here in the prepared remarks referred to the fact that they, themselves, don't propose to be licensees of any stations as such.

I think it is significant that one of the proponents has never been the licensee of a television station and is today (through affiliated companies) offering the public good programs which it sees free; Zenith once was an applicant for a television station and once sponsored a fine program which the public saw free, which had a large audience, I might add. Paramount owns a television station and today renders a fine free programing over that station.

Interest in subscription television goes back a number of years. About a decade ago—when free television was just reaching adolescence—Zenith was gloomily prophesying that free television could never succeed because advertisers could not and would not support television production; at the same time Zenith became one of the leading manufacturers of television receiving sets and advertised the wonders to be seen upon them. It sold millions of its fine sets—and it made millions of dollars for its stockholders—on the basis of representations that those sets would bring to their owners (on a free basis) the very best of sports, entertainment, and culture. As history has demonstrated, their advertising representations were far more accurate than their economic foresight. It is amazing to me that Zenith is today making the same arguments which it made 10 years ago—advertising cannot support free television—despite the fact that in 1955 advertisers spent over a billion dollars on television programing.

Mr. Cox. Well, they have changed their argument to this extent: They are now urging that it cannot support enough television in terms of stations providing multiple service and local service, and that it does not to this date, at least, provide on a regular basis certain types of programs that they contend they could furnish.

Mr. Cohn. That is their argument and it is our contention that astute businessmen like them will not furnish the type of programing which they visualize could conceivably be furnished on subscription television.

Mr. Cox. Aren't they going to have to furnish it in order to get the people to subscribe, at least initially?

Mr. Cohn. Yes—well, not necessarily, because if you take the world series and put it on subscription television, you don't have to take a program with a minor attraction to a minor group of people, but you take the world series, itself. They do not propose any kinds of rules which would prohibit them from taking the world series or I Love Lucy, or Jackie Gleason, or any of the other popular programs and putting them on subscription television.

Mr. Cox. I thought they proposed—at least in the case of Zenith—their comments with the Commission indicated that they favored rules limiting this programing to so-called box-office-type attractions for which the public is already accustomed to make a payment.

Mr. Cohn. They have resisted any type of regulation by the Commission which prohibits them from carrying those programs which have the greatest mass audience today. What they said to you yesterday was "Just give us a chance to experiment. Just give us a chance to put our foot in the door. Just give us a chance to tie up the world series on subscription television, and then if there are regulations that you have to put in, go ahead and put them in."

We have proposed to the Commission that there be some kind of a standard whereby, if a program becomes too popular, that it can no longer be on subscription television, and this has been met with deafening silence by all of the proponents of subscription television.

Senator Pastore. Well, what would be the legal justification for that proposal and who would measure it?

Mr. COHN. The legal justification, sir, would arise from the fact that the Communications Commission has the obligation to protect the public interest, and I don't think——

Senator PASTORE. Which is a fundamental question from the beginning, but I don't see how you reach that justification anywhere along the line. That is the reason why I am questioning you. Your public interest begins at the beginning. It doesn't begin anywhere along the line at a different notch from the bottle. It starts right from the beginning.

Here you have a fundamental question of public interest. It is either public interest from the beginning or not public interest at all, as I look upon it. Now this idea that when it becomes definitely popular to a certain extent, then it must necessarily become free, aren't you getting into a regimented state situation there?

Mr. COHN. I would not prefer to have that kind of system at all, sir. I think it all should continue to be free, but if we are to hold their feet to the fire and take them up on their representation that they want to appeal to minority tastes, the only way you can do that is to enact into some kind of regulation an obligation that they must continue to appeal to minority tastes and not to the mass audience in terms of programing which the audience is getting today.

Mr. COX. Well, as I understand it, this program could have achieved this overwhelming popularity only if it was of high quality and offered at a sufficiently reasonable rate to attract viewers on a fee basis. Now that would indicate that the people at that point were apparently perfectly willing to make the payment and felt they were getting their money's worth in so doing, so like Senator Pastore, I am a little confused as to why, when it gets to some arbitrary percentage of the public or some fixed number of viewers, you are going to turn this over to an advertiser for sponsored television when perhaps the costs would be excessive in terms of the average rate per home tuned in.

Mr. COHN. On the other hand, you must concede that there must be some kind of a mechanism whereby the pay-as-you-go television is not of such astronomical proportions that it deprives free television of the popular programs which we are getting today.

Senator PASTORE. Well, that is the issue in the whole business. That is what I mean. It is right there from the start. Now it either is or it isn't, right from the very start. Now if you are going to develop the argument here that pay television in time will take away from free entertainment, the highest quality of entertainment, and thereby leave what they don't take for the public to consume gratis, and that practically everything that is good is going to be pay TV, that is one argument.

I am not saying it is the right side or the wrong side. I am not getting into decisions here. I am merely pointing up the problem. I could understand that position, but this idea that you are going to allow them to use the program and then when it gets to a certain level of popularity, you say then it becomes the public domain in that sense, I wonder what is the legal justification—you are a lawyer and I am a lawyer, that is why I ask you the question. How would you ever get away with that?

Mr. COHN. Senator, we take the position, first of all, that the two are incompatible and both cannot survive, in answer to your first question. The reason we threw out the suggestion as we did on the question of popularity, is to take up and test, as far as the proponents are concerned here, some kind of a test in order to preclude them from doing the very thing which is threatened by the very fact that they are astute businessmen.

Senator PASTORE. All right, but now let me ask you this question. You are showing a lot of beautiful pictures in your theaters, and I am an ardent supporter of moving pictures—I go 2 or 3 times a week, and you have to pay about a dollar to get in. You decide the price that is to be paid. Now, by the same token, what if the same picture can be shown in a man's parlor for 25 cents. Why should the customer be denied that reduction, between 25 cents and a dollar, using your argument, if you are going to make this an economic question for the consumer?

Mr. COHN. As far as that specific question is concerned, Senator, the picture which is produced for motion-picture exhibition does not have its greatest impact nor enjoyment in the home. This has been tested out innumerable times.

Senator PASTORE. I wouldn't expect you to say any differently, but I disagree with you. I could stand seeing Grace Kelly in The Swan in my parlor and enjoy it just as much as seeing it in one of your seats.

Mr. COHN. It wasn't designed, Senator, in terms of its production for television presentation—in terms of the nature of the shots, the background, the dialog, the scenery—and, also, it wasn't designed to have a telephone interrupt or someone knocking on the door. It was designed for motion-picture exhibition where there are no distractions. So, it is true that if you could see it for 25 cents, rather than a dollar, it would be cheaper, but I don't think you would enjoy it as much.

Senator PASTORE. You mean I wouldn't get cinemascope and all that sort of thing.

Mr. COHN. I am not talking about cinemascope, I am talking about the Ten Commandments, I am talking about the nature of programs which, by their very nature, do not have the same impact and the same enjoyment when you see them at home as when you see them on the screen.

Senator PASTORE. Well, the reason I ask these questions is to get your answers on the record because these questions will pop up. All right, you may proceed.

Mr. COHN. During the past 10 years over $17 billion have been invested in television sets, production, and stations. Of this amount, the consumer public spent over $10 billion on sets, antenna, and repairs. This is the largest amount of money which was ever invested by the consumer public in a new industry in such a short span of time. All of this money was invested on the implied representation of the Government, manufacturers, and stations that the owners of sets would receive programs on a free—and not a fee—basis.

Mr. COX. Well, any such implied representation was that it would be so continued only so long as advertisers found it economical to do so, and there certainly was no warranty that advertisers would support any specific amount of programing or for any specific period of time.

Mr. COHN. That is true, of course, Mr. Cox, but yet on the other hand, you see today, as you say 10 years ago or 5 years ago, the ads of Zenith, RCA, Philco, and all of them: "See on your own television receiving set, free, the following things." This is the way they sold the sets.

Now, of course, to a person versed in the economics of the industry, they would recognize the point which you are making; but as far as the mass public is concerned, they bought that set expecting and hoping to see what they are presently seeing.

Mr. Cox. The man who bought a set in a one-station market—which station is now going off the air—also bought it on an implied representation that he was going to get a service, which he is not getting. There is the implied possibility, although remote at this time, that the sheer costs of television production might reach a point where at least some part of the advertising funds now going into television might be diverted to more economic channels, and that you might get, as a consequence, a reduction. These things cannot be held against the Goevrnment in terms of any implied warranty it has made.

Mr. Cohn. I am not holding them against the Government, sir. I am only suggesting to you that the public assumed that these programs would be free.

Senator Pastore. Along the lines of this recent argument that you have just made, what do you think of the argument that has been made here—have you been following these hearings, I suppose that you have?

Mr. Cohn. Yes; I have.

Senator Pastore. That, after all, UHF in some places is in a bad way. We could take judicial notice of that. What the reasons for it are, and whether this is going to improve it is another question. They say, "All we are asking is to be allowed to experiment with this new vehicle on UHF, realizing that people will have to first of all convert, if they want to see our pay-as-you-go, and will have to buy our equipment to see pay-as-you-go."

Is this an answer to your argument that the public bought the set and they are expecting to see it free? Now you can't see a UHF station in my locality for the simple reason that you have a VHF set. Now answering your argument that the people have bought their set and they expect to see that program—they can't see that program on UHF now because the set they bought is VHF. But they are willing to convert, and they are willing to put on this new apparatus in order to unscramble this picture that comes on pay TV. Now would you say then that your argument applies or does not apply?

Mr. Cohn. It applies, because a I think I demonstrate——

Senator Pastore. Well, you tell me why.

Mr. Cohn. First of all, as far as Zenith is concerned, and as far as all three of the proponents are concerned, in the documents that they filed before the Commission it is clear that they propose to inaugurate subscription television in the major markets of the United States—New York, Chicago, Los Angeles, and so forth. It is true that Mr. Ray Kohn testified here about Allentown, but all you have to do is to look at those documents which those companies themselves, filed before the Commission, and they aren't interested in Allentown. As a matter of fact, Zenith has made public statements—responsible officials of Zenith—that their interest is not in the small community, it is in the large communities.

Senator Pastore. Well, you are arguing motive to me, and I am arguing the substance of the logic that you have raised here, as the point that you make here, that the public has bought a certain number of sets, and invested a certain number of dollars, and they bought them under the assumption that they were entitled to see these programs free. Now the sets that I am talking about cannot see this program, because it is UHF. I am asking you a direct question, and you are getting into the motives of these people—that they don't mean what they are saying. Maybe they do, and maybe they don't.

I am not getting into that; but just taking your argument, would you say that the viewer is being denied some facility or some service that he was under the impression he was receiving when he bought his set, if that VHF set that he bought has actually got to be changed to UHF performance, and he has to buy the apparatus to put on there? Then would you say your argument applies? Do I make myself clear?

Mr. COHN. I think you do, Senator. If you are suggesting that a person who bought a set in a community where there was a station, and there is no station today——

Senator PASTORE. Or there is a UHF station, but he has a VHF set.

Mr. COHN. And has this subsequently been converted?

Senator PASTORE. He hasn't converted yet.

Mr. COHN. Well, he certainly knew that there was a UHF facility there.

Mr. COX. Perhaps he has moved in from another community.

Senator PASTORE. Well, don't let us complicate the question, because then I will never get an answer. [Laughter.]

Mr. COHN. If he bought a VHF set, certainly where he bought it he inquired, or somebody told him there was going to be only a UHF station in the market, and apparently he converted.

Senator PASTORE. No; I am not talking about that.

Mr. COHN. Then I don't understand you, sir; I am sorry.

Senator PASTORE. The argument that you made here is that you cannot impose this upon the consumer who has invested in the set, for the simple reason that when he bought that set he bought it under the implied assumption that he was entitled to a free performance. Now, I am imagining or supposing the situation of a viewer who is in possession of a VHF set, and that is all he can see, a VHF performance.

Now, if the Federal Communications Commission should allot this, or allocate pay-as-you-go television to UHF, insofar as that viewer that I am talking about—if that man has to convert in order to receive the UHF channel, and has to put on the apparatus in order to unscramble this picture so that he can see it, would you say that there would be a breach of some representation, either expressed or implied, insofar as he is concerned?

Mr. COHN. Yes; because he didn't buy a set on the theory that he would have to pay on a per-program basis.

Senator PASTORE. Well, you are just against this thing.

Mr. COHN. Why, of course, Senator. [Laughter.]

Senator PASTORE. No; but you are not answering my question. You made the argument here that the reason why this thing should never be—and I am not saying that I am with you or against you; you may be surprised how I feel—but all the point I want to make out is this: You have made the argument here; here we have the viewer who has invested in a set; and he has bought this set with the implied representation that he would see all of these programs free.

Now, when he took that set home he couldn't see a UHF performance, could he? He knew that when he bought it, otherwise he would have bought an all-channel set. Now, he bought a VHF set to see a

VHF performance. This that we are talking about will be a UHF performance, and he will have to buy the converter in order to do it. Now, why is there any mispreprentation as to that individual?

Mr. COHN. If subscription television is authorized?

Senator PASTORE. Yes. If he is willing to go ahead and go into this expense in order to see it, and to put on the apparatus, why isn't he doing it with his eyes wide open?

Mr. COHN. Of course, he is doing it with his eyes wide open.

Senator PASTORE. And why is he being deceived in any way when he bought his VHF set?

Mr. COHN. I assume when he bought his VHF set there was a signal in the market.

Senator PASTORE. If there were he couldn't use it without conversion.

Mr. COHN. Then the only thing that he had in mind when he bought it was the necessity of the one conversion to UHF.

Senator PASTORE. Well, he can do that, of course, and not buy up the equipment for pay as you go.

Mr. COHN. Right.

Senator PASTORE. And see the free performances that come over.

Mr. COHN. Right.

Senator PASTORE. But we are talking now about misrepresentation.

Mr. COHN. Well, during these evening hours of 7 to 10, he is going to have to pay per program, and he didn't buy his set on the theory that he would have to pay on a per-program basis.

Senator PASTORE. Then he would have bought an all-channel set in the beginning, wouldn't he, if he thought that he was going to use UHF? He could have bought an all-channel set?

Mr. COHN. Well, of course, he could have.

Senator PASTORE. But he didn't buy that. He bought VHF because that was all he wanted to see; isn't that so?

Mr. COHN. Right.

Senator PASTORE. Now, something new comes along, and he purposely converts and puts on this apparatus in order to come in on the pay-as-you-go market. You couldn't say that in that particular case there was any deception; could you?

Mr. COHN. If this were an additional service where he voluntarily is going out and doing it, and it isn't depriving him in any way of the free programs, then there wouldn't be any deception.

Mr. COX. Well, how is anyone ever going to compel one viewer, or a million viewers, to make an expenditure that he doesn't want to make?

Mr. COHN. The compulsion comes from the fact, as is developed further in the statement, that the programs, themselves, will necessarily go into subscription, pay-as-you-see television, rather than remain on free television.

Mr. COX. They will not go into subscription television unless enough set owners have voluntarily made this payment to purchase a decoder, or undertake to pay for programs, to hold out the promise of substantial revenues which would attract the programing you are talking about. Now, that choice would be made voluntarily by the public on the basis of programs offered to them, and which they could accept or reject; wouldn't that be true?

Mr. COHN. That is correct.

Mr. Cox. So that they can—even if the FCC authorizes subscription television, the public can reject it at the first instance by never buying a decoder?

Mr. COHN. That is correct.

Mr. Cox. Or having purchased a decoder, or having installed one in their home on lease, if they find that the programs are not as advertised in advance, that they do not enjoy them, or that they would rather go to the theater and see the movie, then they have that option.

Mr. COHN. That is correct, but that is all on the assumption that they want to give up the popular programs which they want to look at, which must, of necessity, in my judgment, go to pay-as-you-see television. They don't have to watch the world series. They don't have to watch Peter Pan. They don't have to watch the Rose Bowl games. Of course not. It is something like Victor Hugo's remark about the French democracy. He says it is a wonderful place. Everyone doesn't have to sleep under the bridge at night unless he wants to. It is the same thing here. People don't have to subscribe to television and pay for it. They have a choice, to pay or not to pay, but if the finest of the things go to pay-as-you-see television, then it automatically follows that there is the compulsion for them to convert their set to pay as you see.

Mr. Cox. But that going to pay-as-you-see television could have come about only after a substantial part of the public had, of its own volition, made investments and acquired viewing habits which will support it on that basis?

Mr. COHN. When you say "substantial part," it is certainly nothing like the audience which a television program of a popular nature has today. All you have to have is a small segment of that audience in order to make it profitable for the pay-as-you-see people to put it on.

As Commander MacDonald pointed out in connection with the Peter Pan program, he said isn't it a shame that that wasn't on—this is Mary Martin's Peter Pan—on pay as you see, because at 25 cents, if we only had 25 percent of the total number of people who saw it free, we would have made far more money than the network or the television stations had made by giving it away free.

You don't have to have a hundred percent of the present audience.

Mr. Cox. Well, wasn't the point Commander MacDonald was actually making that if you were in a position to make a charge of 25 cents, that the public would be offered that type of program more often than it has in the past?

Mr. COHN. I don't think that was his letter. It was an appeal to people who were interested in this particular problem to support subscription television because that is where the big money was, and that is the way to charge the public instead of giving it to them free.

Senator PASTORE. How does your association justify the showing of the professional heavyweight fights? Isn't that a form of pay as you see?

Mr. COHN. You mean on theater television?

Senator PASTORE. Yes.

Mr. COHN. No; it is not pay as you see.

Senator PASTORE. Why not?

Mr. COHN. May I explain? First, the frequencies which are used are not broadcasting frequencies—they are point-to-point communications, the same, Senator, as you pick up a telephone and talk to New York from here.

I do not have the right to listen in and to hear what is said on that telephone communication. What has happened with theater television is the frequencies which are used are rented from A. T. & T., the same as we rent a film or anything else. So right at the outset they are not frequencies that the public has a right to listen to.

Secondly, when there is a theater television fight in Washington on a particular night, the four television stations in this city continue to operate and give free programs. If one of those television stations put on a pay-as-you-see program, over the television station on that particular night, you would not have a choice of 4 free programs, you would have a choice of 3. There would be a substitution of pay as you see for free.

We are, in fact, through theater television, supplementing and giving you a fifth choice. Those, I think, are the two market distinctions.

Senator PASTORE. Well, can't these other boys who are interested in pay-as-you-see television make the same argument, that this is something you are not getting now, and you can only see it if you put the quarter in the machine, or you buy the card that is sold, and we are not interfering with anything else because, after all, your free entertainment is going on anyway?

You can slice this pretty thin at certain angles, but why isn't the principle more or less the same?

Mr. COHN. Let us take a one-station market, sir, in order to dramatize the point. If that one-station market exists, and there are a number of them, and they put on the fight, they are actually substituting, for the only service in that particular community, pay for free television, while if it is on theater television you have a choice. You either can see whatever is on the television station free, or you can go to the theater and see the fight.

Senator PASTORE. Of course, that is the extreme case, but I doubt very much that the FCC would ever tolerate that situation. I mean, for instance, you come down to the toll-road idea. You can have a toll road provided there is another way of going. It may be the hard way of going, but unless you have a private domain you cannot usurp the public domain by saying you have to pay a price to get from this point to that point, unless there is some other way of getting around to it.

Now, I don't think they would ever allow that kind of situation. That, to me, would be the worst kind of supervisory dereliction that one could imagine, if the public that has a set and only has one vehicle, or one channel, would have to subscribe to the idea that at times they would have to pay to see any performance, because otherwise there would be a blank screen. I don't think that would even be permitted.

We are talking about these situations where you already have everything that people presently have, and then you add to it something else. Now, I go along with the idea that the serious question here is to determine, in the long run, what this is going to do to free entertainment. That is the thing that concerns us all. All of these economic questions, of course, are all offshoots of the main issue. The main issue that will confront this Congress, of course, if we have to take action, is: Here is this something that will promote and add to the public interest; or is it something that is destined to be attractive in the beginning and the long-run effect of which will be to destroy free entertainment? I mean that is the main issue.

Now, we can dress it up with a lot of arguments, and that is the only reason why I questioned you on this argument of the television set, because the argument has been made here that in a market like Providence, where you have 2 VHF and 1 UHF—that UHF is presently closed in Providence. I am only pointing that out as a typical case.

Now, there are some people who think that if you had pay as you go on that particular station, you would be reviving a dead station. Now, there isn't much conversion in Rhode Island. But if people wanted to buy that kind of entertainment, and they wanted to convert in order to have it, and they wanted to buy this equipment that these gentlemen are talking about, then if that doesn't hurt the free entertainment that is presently going on on channel 12 and channel 10, then what harm is there in it? That is the main issue.

Well, your argument is that in the long run it might hurt it anyway. I can understand the argument that you are trying to make. But, fundamentally, it isn't being presented here in ridiculous arguments. These people that have come forward recognize the fact that they, too, are interest in the public interest, and, of course, they are interested in profits, too. I think about every witness that comes here is interested in profits in one way or another. But the point that we have to decide here is whether or not this thing can be done, in order not to hurt or injure anybody else, not to put other people out of business. I can understand that your apprehension here is that it might actually destroy the whole local theater market, which is a pretty well depressed market as it is. I can understand the economic plight that you are concerned about.

Well, those are the questions that we have to weigh, and those are the decisions we have to make. But I can't possibly imagine the Federal Communications Commission coming along and, in a locality where they have one station, or one channel, allowing that one channel to be devoted to pay-as-you-see and also free entertainment, because it would never go. I can understand that, but we are talking about these other situations.

Mr. Cohn. But, Senator, you had a spokesman for Zenith yesterday make the basic argument: "Let us not have any regulation at the outset. The regulations will come later. We don't know what is going to happen with this pay-as-you-see. We don't know what kind of problems are going to arise, and, therefore, neither the Commission nor Congress should interfere at this time. Just let us get a toehold in the door, and then in the years to come, if you want to regulate us, regulate us then."

I agree with you, that it would be an abominable situation in a one-station market, for pay-as-you-see television to be established; and yet apparently the plea yesterday was for no regulation at all, of any kind, to begin with.

Senator Pastore. No, no. They didn't quite go that far. What they did say yesterday, in justice to them, is this: "It may be impossible now to set a formula that would be a workable one. We admit that we must be under supervision, but you couldn't, in the beginning, set a hard and fast rule because we haven't had the experience, but this thing should be watched from day to day."

Now, they did make that admission, and I tell you very frankly, I don't know whether this is going to be allowed or not, but if it ever is, of course, it has to be very strictly supervised, in the public interest, on the part of the FCC—if only to do one thing, not to get us in the present mess that we are in on television.

Mr. Cox. Isn't it true that they do propose to the Commission a restriction in stations that would be initially authorized to provide subscription service, and that they also propose a limitation on the percentage of hours to be devoted by those stations to subscription service?

Mr. Cohn. As far as the second point is concerned, yes, and the limit, as already pointed out, allows them as a practical matter to take the hours from 7 to 10 in the evening, 7 days a week.

As far as what type of stations are concerned, there is a dispute or a difference between the three different proponents, and I don't think there is any uniformity as to what their objective is.

Senator Pastore. All right, now, you may proceed. I am sorry we had to interrupt you this way, but sometimes I think we get more definite answers when we do.

Mr. Cohn. Of course, sir.

II. PAY-AS-YOU-SEE TV WILL NOT BRING NEW PROGRAMS

In order to sell their wares, the pay-as-you-see-TV salesmen—and this really should be pay-before-you-see-television salesmen—have dangled before the public and the Commission the prospect of new programs. Without this lure they recognize that their ultimate objective—charging for the programs which the public sees free today—would become too obvious. However, the cold hard facts are that pay-as-you-see TV cannot and will not provide, to any appreciable extent, programing that is not now available on free television and in the process of providing, perhaps, a new program here and there it will end up by forcing the public to pay for the programs which they see free today.

The free programing on television during the past year—the demonstrated record of what the industry has, in fact, done, and not promises for the future is the most effective reply to the glib future promises of these salesmen. There is nothing which they can promise which is not already there. Tens of millions of people in these United States saw Richard III premiered over television even prior to its first showing in the motion-picture theater; they saw Katherine Cornell make her television debut in the theater classic The Barretts of Wimpole Street.

Senator Pastore. Was that propaganda against pay-as-you-go television, the timing of this? Isn't that the first time in the history of the theater business that anything like this was done?

Mr. Cohn. No, sir.

Senator Pastore. All right, to get that on the record—because I have heard that accusation made—would you tell us the other times?

Mr. Cohn. I will be glad to supply memoradums on that.[1]

[1] The information was furnished by Mr. Cohn in a letter dated May 11, 1956, which was ordered inserted in the record on May 15, 1956. It will be found in the appendix to this volume at p. 1467.

Mr. Cox. Isn't it true that the reason these are so worthy of comment is that they are above the average level of regular performance on television?

Mr. COHN. You are talking about an industry, Mr. Cox, which has really reached its bloom in a period of 4 or 5 years, and I think it is one of the great things that has happened in this country that an industry in its infancy, just started literally yesterday, has been able in such a short space of time to do the things which it is presently doing.

Of course, 8, 10, or 12 years ago you didn't have television programing like this; but in such a short space of time to have the magnificent programing which we are having today, with the stars which we are having today, the type of programing, is one of the greatest things which is happening in this country.

Mr. Cox. Was Richard III carried by the network at a loss?

Mr. COHN. I am not prepared to testify on that.

Mr. Cox. Hasn't it been so reported in the press?

Mr. COHN. I didn't see any such report on that, sir.

You saw Mary Martin in Peter Pan; The Sadler's Wells Ballet; discussion and analysis of the farm and Middle East problems on See It Now. There was hardly a sport that was not regularly televised; not only such popular sports as baseball, football, and golf, but also sports which do not appeal to large audiences, tennis, billiards, ping-pong, track, swimming, and hockey. As a matter of fact, the major problem that every football fan faced on January 1 was the dilemma of which one of the multitude of bowl games to watch. It was a year when a movie version of the television play Marty was voted the best motion picture of the year. With 1 or 2 minor exceptions, the larger motion-picture-production companies are making available their product for television programing.

Mr. Cox. Today. That is largely pre-1948 film, isn't it?

Mr. COHN. Yes. In addition to that, I should add that they are producing special types of film, specially designed for television production and television presentation.

Mr. Cox. Those, however, are customarily half-hour programs of a kind that, at least at the outset, subscription proponents do not propose to offer?

Mr. COHN. I don't know whether the subscription television proponents propose to offer it or not.

Senator PASTORE. Mr. Cohn, don't answer this question if you don't want to, I won't hold it against you. Has television actually hurt your industry? I don't mean to be funny with this question. I hoped that the people in the audience wouldn't be snickering or laughing at these questions. We are trying to formulate a record here.

There are divergent points of view, and they are all honest men that come here that have an interest in legislation, and we don't want anyone ridiculed or chuckled at just because he doesn't represent our particular point of view. It is our job here to be impartial and to be fair. If we ask a question we don't ask it to be frivolous. We are trying to compile a record, and I am very serious when I ask you the question: Has television, in and of itself, hurt the motion picture industry in the exhibitor point of view?

Mr. COHN. The answer to the question, I think, is yes; but may I say a few words on that?

Senator PASTORE. Yes; go ahead.

Mr. COHN. The greatest problem that the motion picture exhibitionist faces today is a shortage of product. That shortage of product arises from the fact that the producers of film, themselves, do not produce a sufficient amount of film whereby exhibitors have the product which they can show to the public and make a profit from it.

Of course, every amusement is in competition with a different amusement. There are all kinds of industries which are competing for leisure time, and certainly television, just as baseball or football or any other thing, competes with the motion picture theater.

In one sense television, free television, has helped the motion picture, and the picture Marty that I referred to here is a perfect illustration. I think there is more of a marriage today between the television and motion picture industry than there has ever been before, and I think that marriage will continue to progress, in terms of artists, stars, writers, and all that. But as long as there has been established a competing medium; namely, television, it is inevitable that there is a competition for leisure time there.

Does that answer your question, sir?

Senator PASTORE. Yes; it does. In other words, what you are saying is that even though the quality of picture that you may show on your screen may be much superior to a performance that one could see on television in his home, you have two elements—the first, of course, is the fact that the individual remains in the comfort of his home to see it at his convenience, and, second, the fact that he is seeing it free?

Mr. COHN. Yes; and, on the other hand, as I pointed out a moment ago, the enjoyment of such a thing as a motion-picture film in the theater—just as any other thing that you go to a designated place to view, down at Constitution Hall, or the National Theater here in Washington—requires the undivided attention of the audience, and it is built upon the concept that it will have the undivided attention of the audience, and not upon either a 10-, 20-, or 21-inch screen, but upon a whole panoramic view of the events taking place. Consequently, although, of course, there is a tremendous enjoyment in watching free television——

Senator PASTORE. You know it makes me laugh when you say that. You have children of your own?

Mr. COHN. I do.

Senator PASTORE. I can't even breathe in my house when Cheyenne is on. [Laughter.] You are talking about undivided attention. I get your point, though. You may proceed.

Mr. COHN. During this year telecasts of the two political conventions will be seen on a free basis, just as they were 4 years ago. There is no reason to believe Ed Sullivan, I Love Lucy, Roy Rogers, Disneyland, Omnibus, and Jackie Gleason will not continue to appear throughout the year on a free basis—except for the fact that insofar as Jackie Gleason is concerned he has already publicly stated that he would switch to pay-as-you-see television programing if it were authorized since a television turnstile would provide him with greater income.

Mr. COX. Well, he is free to take his talents to any other medium. He can make a movie, unless he is bound by contract not to, or he could appear in night clubs?

Mr. COHN. That is correct.

Mr. COX. And he could, in fact, appear on both sponsored and subscription television, if he were not contractually prevented from doing so.

Mr. COHN. But I don't think he would want to appear on sponsored and pay-as-you-see television at the same time, because obviously if he wanted to get the greatest amount of income, the greatest amount would be to have the captive audience put the quarter or dollar in the slot for each one of his programs.

Senator PASTORE. What do you think of the question of pay-as-you-see television contesting with the advertisers on free television—as to what the situation would be there for the better programs. Who do you think would be able to outbid the other?

Mr. COHN. I think pay-as-you-see will be able to outbid. There is very little question in my mind about it. They are talking about wanting $3 million from the Gillette Co. for the world series. I think $3 million is a drop in the bucket compared to what you can get on pay-as-you-see television for the world series.

Senator PASTORE. Do you think there is any way of controlling that?

Mr. COHN. Yes, sir; by not establishing pay-as-you-see television. [Laughter.]

Mr. COX. Well, if you do not establish it, isn't there a reasonable chance, at least in the view stated by Governor Johnson in his statement filed yesterday, that perhaps you will not be able to see it on television at all—that the only way that you can see it will be either to go to the park or to go to a theater on closed circuit?

Mr. COHN. That is for the minor leagues he was talking about.

Senator PASTORE. Yes.

Mr. COX. Well, isn't there also a possibility that Gillette will not pay $3 million for the worlds' series?

Mr. COHN. That is a possibility.

Mr. COX. And that no one else will pay it?

Mr. COHN. That is a possibility.

Mr. COX. Then you have the choice between the major leagues reducing the price to a point which they regard as perhaps uneconomic or the program not being broadcast at all.

Mr. COHN. I don't understand your point of it not being economic. It would appear to me that whether they got $1 million or $3 million, it would be economic in terms that they would be getting something which they wouldn't otherwise get.

Mr. COX. Unless they got a sellout for this event, then anything they received would be economic.

Mr. COHN. Yes; it is not a question of economics, it is a question of what they would like to get. What they would like to get is far more than they are getting now for which I don't blame them—but not at the expense of the public.

Senator PASTORE. Do you think this could be controlled in the public interest on the allocation of time; I mean that you could only use it so much, at certain hours in the evening, and so much at certain hours during the day, to make sure that you have an overabundance of free time and that there couldn't be an infringement, or a raid, upon the best kind of programs because you wouldn't have the time to show them?

Mr. COHN. That certainly would be cutting the baby in half, if I might use the expression, Senator, but it is our contention that once the camel gets his nose under the tent here——

Senator PASTORE. Well, without good supervision, of course, much of this boils down to that. Of course, this could be a runaway thing, if it were just let go without some kind of supervision. My personal feeling—I am not saying it is going to happen, I don't say it isn't going to happen, I know nothing about the answer that the Congress of the United States will ultimately reach—but I do know this: If it ever comes about, it will have to be very strictly supervised to see that the public which is receiving free entertainment isn't injured in that respect.

Mr. COHN. Right.

Senator PASTORE. You can't disturb that. That even would be politically unwise.

Mr. COHN. We are told that pay-as-you-see TV will make Broadway plays available to the home viewer. This is an illusion. There are actually only an isolated few Broadway plays suitable for the living room. A moment's thought and recollection of some of the words or songs or scenes in Damn Yankee—which, by the way, Mr. Poller referred to yesterday—Cat on a Hot Tin Roof or Tea and Sympathy should make this abundantly clear.

This is true not only in terms of the type of plays but, also, in the basic differences between the two media—the stage and the television screen. It is obvious that television cameras could not simply walk in and photograph a stage production. If the play is to be of interest to the home screen viewer, it must be restaged and rewritten to conform to the different medium. Actually, the promise of Broadway plays is, at best, a promise of dramatic programs—which is not a particularly new or novel type of television programing.

The sudden interest of Telemeter and Skiatron—both of which, through affiliated companies, have been involved in motion-picture production—in presenting ballets, symphonies, and other cultural fare for isolated minority groups over pay-as-you-see does not bear analysis. The same reasons that force them today to search for mass appeal products, will compel them to present pay-as-you-see programs that have the largest and not the smallest mass appeal: Economics. They argue that only through a home box office can television provide the kind of programing which the majority does not appear to desire but which a significant portion of the minority of the population appears to want.

This is just not so. If 10,000 people were willing to pay $2 a person for an algebra lesson—and I know that Professor Landis referred to it now as differential calculus—and a million people were willing to pay 50 cents a person for Perry Como, the audience would be shown Perry Como and not taught algebra. This is particularly true because of the fact that most of the costs of subscription television—the cost of manufacturing, installing, and servicing the decoder attached to the home set, and the cost of converting the television station so that it can send out an undecipherable signal—are fixed costs.

As the diversity and quality of the types of television programing have continued to expand, the pay-as-you-see TV proponents have continued to shift their ground and now they plead on behalf of that segment of the public which would pay a dollar a night to be taught algebra or the fundamentals of astronomy. There is no question but what such programing would fulfill the isolated needs of a minute minority. I am not persuaded, however, that pay-as-you-see TV should be established in order to supply the needs of these isolated and minute minorities.

In the first place, it is inconceivable to me that the proponents, if, as, and when pay-as-you-see TV is established, will desire to serve such relatively insignificant minority tastes when Jackie Gleason and the baseball owners will be clamoring for the right to present their products over the system. I assume that these three proponents, as any other businessman would, will consistently seek that type of programing which will have the greatest—and not the least—public appeal. We have suggested, in our comments to the Commission, a formula, to which I have already referred in the course of my previous comments here, whereby it would preclude, if pay-as-you-see television is authorized, the taking away of the popular programs from free television, or some kind of system which would enforce a policy where pay-as-you-see would be designed only for minority tastes. As might be expected, the suggestion has been met with a deafening silence.

Even assuming that the proponents, in fact, ultimately program in order to appeal to minority tastes, it must be borne in mind, throughout this hearing, that a television station can present only 1 program at 1 time. No matter how many times the proponents repeat the fact that their plans envisage supplementing existing television programs, the cold, hard fact remains that whatever program they would put on an existing station today would have to be a substitute of what appears on that particular station today. If such programs are to be put on, in choice evening hours, it is axiomatic that such a program would displace one of the far more popular programs which the public views today.

The answer of the proponents to this cold factual situation is that their programing would enable new stations to arise in isolated communities which do not have a television station today. This, once again, is the glib talk of the salesmen. They have no interest in establishing or providing a service to a pay-as-you-see television station in Goldfield, Nev., a city of less than a thousand people, where the Commission has allocated channel 5, a VHF channel, and no one has applied for it. If they were really concerned with establishing additional television service they would voluntarily take a position which would prohibit them from programing in the first 100 markets in the United States over existing television facilities.

I want to close this portion of the comments which I have here with this quotation from Elmo Roper, in an article in the Saturday Review of Literature——

Senator Pastore. But you want this whole statement in the record exactly as it appears in your prepared statement.

Mr. Cohn. That is correct, sir.

Senator Pastore. All right.

Mr. Cohn. He was commenting on the fact that the Saturday Review of Literature had taken a poll and shown the majority, or substantial portion, of its readers who were interested in pay-as-you-see television programing based upon the theory that they would have literary things on the programing for pay-as-you-see and things which would appeal to those minority tastes, and Elmo Roper commented, and I think it is a great statement:

It is a truism that an important function of the democratic system is to accommodate minority needs. However, just as integral a part is to make certain that in meeting the needs of the more articulate, more privileged minority we do not risk the chance of the majority to find cultural outlets within the economic limits they can afford.

I also want to comment on the fact, as set forth on page 8 of the statement, that using our calculations, Senator, which are predicated upon the Zenith estimate of costs per program, and the average time spent by a family watching programing, and assuming that the family will continue watching pay programs at the present rate that they are watching free programs, the average family would spend $1,156 per year. You should bear in mind that 60 percent of the television sets which have been purchased were purchased by families with an income of less than $5,000 per year.

Mr. Cox. That calculation is based as you indicate upon the assumption that free television is completely eliminated.

Mr. Cohn. That is correct. I am saying that using the Zenith figures what they estimated the cost to the public would be for pay-as-you-see television and assuming that the public continues to watch pay-as-you-see television at the same rate the cost will be $1,156 per year.

Mr. Cox. That is based upon an assumption that the FCC would have undertaken no regulation upon maximum pay programing.

Mr. Cohn. That is correct. Or it also is true that perhaps Zenith would be able to demonstrate to the Commission that those figures which they had supplied are fair and reasonable and therefore, if that is true, this figure would still be valid.

Mr. Cox. Now, this $1 figure per 90-minute program, which you use as your basis for determining the 66-cents-an-hour multiple—was that their estimate as to the cost of all of their programs? Hasn't there been an indication that they thought there would be variation—that some programs could be offered at 10 cents, some at a quarter, depending primarily upon the number of viewers who could be attracted?

Mr. Cohn. These figures which we used were the figures which Zenith supplied the Commission in connection with its Chicago experimentation.

Mr. Cox. That was primarily the showing of feature films; wasn't it?

Mr. Cohn. That is correct.

Mr. Cox. For other programs they might have lower costs, or they might be able to achieve larger audiences which would make other figures applicable?

Mr. Cohn. Yes, and they might have higher costs, also.

Mr. Cox. Yes, in the case of opera, and so forth.

Mr. Cohn. Yes, I would also like to point out that 60 percent of the sets that exist in the United States today were bought on the installment plan.

III. FEE TV WILL KILL FREE TV

The authorization of pay-as-you-see television on broadcast frequencies is the creation of a competitor to free television that can and will outbid it for the best of its talent and program material and, consequently for audiences and ultimately revenue. The bulk of the programing which pay TV will present must of necessity be the very kind of entertainment which has found favor on free television.

The potentialities of the raid on free television has already become apparent; organized baseball and other sports' promoters are avid pay-TV fans. Their programs are currently shown on television, but they have been frank enough to state publicly that they could make far larger sums if the public were required to pay to see their sporting events. And, frankly, one cannot really blame them—if the problem is viewed without any regard for the public interest. Why should they depend on the paltry hundreds of thousands of dollars from Gillette for the sponsorship of the world series, when they can be guaranteed millions if 30 million people are required to pay a dollar for each telecast of the world series, if they want to see it.

Mr. Cox. Doesn't the public have an interest in the survival of organized sport? You are familiar with the statement of Governor Johnson?

Mr. Cohn. I am, sir.

Mr. Cox. Wouldn't you feel that perhaps a necessary compromise would have to be reached here where, in order to have these sports available to them in their homes, they would have to make payments, part of which could be channeled into the hands of the promoters of the sports simply to guarantee their continued existence?

Mr. Cohn. Not necessarily. I think, with due respect to Senator Johnson's statement, that the thing has worked out in a way today where, through a series of adjustments and compromises, it is not quite as dire as the prediction that the Senator has made. I recognize that there are problems created by free television for the baseball industry, and yet we find, as far as the major leagues are concerned, attendance, with Mr. Poller talking about the attendance in Milwaukee reaching new heights, some dropoff in the normal question of the competition for leisure hours, and yet the baseball clubs are making money. I can't blame them for wanting to make more money and prosper even more under pay-as-you-see television, but I don't think it is in the public interest, particularly with the dangers which are inherent in the pay-as-you-see television as far as the total impact upon the interest of the public.

Sports are but an illustration. Every program that has a proven audience appeal is in danger of being subverted to the coinbox. Sports programs merely illustrate the fact that any program which is now a success on television is suitable for and must inevitably—by the very law of economics—be used by pay-as-you-see television.

Subscription television and free television are not only basically competitive, but the competition is unequal and the two cannot both survive side by side. The huge revenue potential of pay-as-you-see television is multiplied with every successful subscription program. Successful pay-as-you-see TV would deprive free television of program resources, of audiences, and, consequently, of income; and the effects will pyramid. Not only will subscription television be able to outbid free television for programing by being able to offer more money, but, also, diminished audiences for free television will make less money available from the sponsors.

Senator, I realized when I sat down that there were others who also were to appear and I don't want to appear to be hogging the light in terms of other people from out of own here who have been scheduled to appear.

Senator PASTORE. We will put the entire statement in the record and I would appreciate very much if you would summarize from now until the conclusion of your statement.

Mr. COHN. I was going to make that suggestion to you, Senator.

Senator PASTORE. All right, we appreciate that.

Mr. COHN. In the fourth portion of the statement I take up the question, and I think demonstrate that pay-to-see television will not solve the UHF problem. First of all, if a person has a converter today which has been converted to UHF he is now required to buy, if it is either Skiatron or Telemeter, a new converter, or lease from Zenith a converter, in order to see pay-as-you-see. He is going to have to convert his converter, so to speak. In the comments which have been filed with the Commission, and I keep referring back to those, Senator, comments which were filed prior to the time that the UHF problem became as critical as it is today, the proponents of pay-as-you-see television laid their principal emphasis on the point that they wanted to establish their system in the major markets in the United States—and when I say major, I mean the top 5 or 10. I suggest to you that it is because the problem of UHF is a critical problem today, and I am familiar with it as I am sure you are, and you have demonstrated your interest in it, Senator—but it is because it has that appeal today and needs a solution, that they are today talking about subscription television as being the answer for the solution of the UHF problem.

They want the largest audiences and they want the audiences which they can get with the least expenditure as far as the public is concerned, and those audiences are in the major markets of the United States which have VHF stations. And I repeat once again, all you need do is to look back at the public statements of all of these proponents, and you will find repeatedly—not during the past 3 or 4 months, but I am talking about 1953 and 1954—the statements that they want subscription television on VHF stations in the major markets in the United States.
