### Ideal for All Insulation Resistance Diagnostic Applications

Range of insulation resistance measurement expanded to a maximum of 10 TΩ. Functions such as automatic calculation and display of maximum PI (Polarization Index) and DAR (Dielectric Absorption Ratio), as well as step voltage test, temperature compensation, temperature measurement, and leakage current display make the IR3455 suitable for a variety of diagnostic applications.

### Expanded operating temperature range

The temperature range in which the IR3455 can be used has been expanded to -10°C to 50°C (14°F to 122°F). This allows reliable use throughout the year, regardless of temperature.

### White backlight

A white backlight makes the IR3455 easy to operate even in low-light conditions. Visibility has improved compared to the legacy model, making it easier to confirm measurement values.

## »Features

### Wide Range Test Voltage Settings

Generate test voltages ranging from 250 V to 5 kV. Settings can be made in steps as fine as 25 V. Perfect for measuring the insulation of high-voltage equipment such as transformers, cables, and motors.

### Data Memory Function

The IR3455 provides a manual storage function for 100 data and a logging function for 10 data (360 times). Date and time are also stored, reducing the need for handwritten notes.

### Bundled software

Use the included application software to easily graph step voltage test data and create reports.

## Safe and Easy-to-use Design

### Shutter mechanism

A shutter mechanism prevents simultaneous access to measurement terminals with other terminals. Other safety features include a voltage measurement function, high-voltage warning indicator, and auto discharge function.

### Bar-graph display

Use the logarithmic bar graph display for analog measurements. The insulation resistance is indicated by the number of dots that appear on-screen.

### CAT IV 600 V

The IR3455 is designed to comply with safety regulations for category IV measurements (600 V), to reduce the risk of electric shock and other accidents from the input of high voltage.

### USB interface

Install the included software on your computer and connect via USB to transfer the data stored in the internal memory of the IR3455 to your computer.

### Battery pack support

Use either AA batteries or the rechargeable battery pack, for reliable operation in environments where batteries are not available or when there is no time to recharge.

### Hard case

The hard case is ideal for use at work sites. It is compact and easy to carry, and provides room for storing test leads.

## Measurement Functions

### Wide Range of Voltage Generated for Measurement and Testing

#### Insulation resistance measurements

Select a test voltage from 250 V, 500 V, 1.00 kV, 2.50 kV, and 5.00 kV. More finely graded settings are also possible. When measurement is completed, the unit shows the insulation resistance value, test voltage (setting and actual output), leakage current, DAR, PI, and elapsed time. Save measurement conditions and measurement results to internal memory, and view them on a computer.

##### Insulation resistance measurement display

#### Step voltage test

In this type of test, the voltage is gradually raised and the insulation resistance and leakage current change is measured. Two different step settings are available: 500 V → 1 kV → 1.5 kV → 2 kV → 2.5 kV and 1 kV → 2 kV → 3 kV → 4 kV → 5 kV.

##### STEP 5.0 kV step voltage test

Voltage application time for each step: 30 s/1/2/5 min.

## Display Functionality

### Leakage Current and Insulation Quality Parameter Displays

#### Leakage current display

When measuring insulation resistance, the instrument can be switched to display the leakage current. This is possible before, during, and after measurement.

##### Leakage current display during measurement

#### PI and DAR display

PI: Polarization Index

DAR: Dielectric Absorption Ratio

The PI and DAR values which are used as an evaluation standard for insulation are automatically calculated. With the insulation resistance measurement start point as reference, the calculation is performed as shown on the right, using two resistance values obtained at a prescribed time interval.

Formulas: PI = resistance value 10 min after start / resistance value 1 min after start  
DAR 1min/15s = resistance value 1 min after start / resistance value 15 sec after start  
DAR 1min/30s = resistance value 1 min after start / resistance value 30 sec after start

### Resistance Range Accuracy

### Insulation Diagnosis

Temperature compensation	Result converted to insulation resistance at reference temperature. Ten (10) different temperature compensation tables can be selected, according to the insulation material of the object measured. Reference temperature: 20°C (68°F) or 40°C (104°F) by default. This setting can be changed.
PI/DAR display	PI: Polarization Index DAR: Dielectric Absorption Ratio After insulation resistance measurement has started, calculation is performed using two resistance values obtained at prescribed time intervals. Formulas: PI = resistance value 10 min after start / resistance value 1 min after start DAR 1min/15 s = resistance value 1 min after start / resistance value 15 sec after start DAR 1min/30 s = resistance value 1 min after start / resistance value 30 sec after start

Step voltage test	Measurement of insulation resistance while raising voltage at specific intervals. Two voltage step patterns can be selected. STEP 2.5 kV: 500 V → 1 kV → 1.5 kV → 2 kV → 2.5 kV STEP 5 kV: 1 kV → 2 kV → 3 kV → 4 kV → 5 kV Voltage application time for each step: 30 s/1/2/5 min.
