

# Pregnancy: Frequently Asked Questions

## What should I avoid eating?

The good news is that most of the things you love are still safe to eat. However, make sure that you avoid:

- Seafood high in mercury
- Raw or undercooked seafood, meat, poultry and eggs
- Uncooked deli meats/cold cuts
- Refrigerated pate or meat spreads
- Unpasteurized foods/drinks
- Unwashed fruits and vegetables
- Raw sprouts

## How much weight should I gain?

It depends on how much you weighed pre-pregnancy. Here are the recommendations based on your BMI:

< 18.5 (underweight)	28-40 lb gain
18.5-24.9 (normal)	25-35 lb gain
25.0-29.9 (overweight)	15-25 lb gain
≥ 30.0 (obese)	11-20 lb gain

With one baby, you need an extra 340 calories every day starting in the second trimester (and slightly more in the third trimester). With twins, you will need 600 extra calories a day, and with triplets, you will need 900 extra calories a day.

## How can I protect myself and my baby?

While you're pregnant, you have to be extra careful about your health and safety. Avoid:

- Tobacco smoke and air pollution
- Alcohol or other recreational drugs
- Cat droppings or litter
- Flea collars, flea soap, or any medicine meant to be put on a pet's fur
- Pesticides, bug bombs
- Lead paint/pipes, or containers made of pewter, brass, or lead crystal
- Contact sports or other activities with risk of fall or injury
- Excessive heat or hot water (>100°F) in the first trimester
- Riding in a car without a seat belt

Pelvic rest or bed rest are not routinely recommended during pregnancy, however, they may be recommended or suggested by your doctor if you develop certain high risk conditions.

**When in doubt, ask your doctor!**

## How often will I have visits, labs, and ultrasounds?

Visits: The rule of thumb for prenatal visits is every 4 weeks until 28 weeks, then every 2 weeks until 36 weeks, and every week after that until delivery.

Labs: At a minimum, you will need labs drawn at your first prenatal visit. You should also get another set of labs between 24-28 weeks and between 35-36 weeks.

Ultrasounds: You will need at least one ultrasound to confirm your pregnancy and one between 18-22 weeks for an anatomy scan. Sometimes other ultrasounds are needed to check the baby's position, weight, or overall well-being.

## When do I need to call the office or go to the ED?

Labor symptoms: Please go to the hospital if you are having strong regular contractions, loss of amniotic fluid, vaginal bleeding (more than spotting), or decreased fetal movement (>24 weeks of pregnancy).

Illness: Please call the clinic if you are having flu-like symptoms such as fever, chills, cough, sneezing, runny nose, and muscle aches. If you are having trouble breathing, chest pain, or other severe symptoms, you need to go to the hospital immediately.

# Safe OTC (Over the Counter) Medications to use in Pregnancy

## For acid reflux/ upset stomach

- Maalox
- Mylanta
- Tums
- Rolaids
- Pepcid (Famotidine)
- Zantac (Ranitidine)
- Prilosec (Omeprazole)
- Tagamet (Cimetidine)

## For diarrhea

- Imodium (Loperamide)

## For gas

- Gas X/ Mylicon (Simethicone)

## For nausea/ vomiting

- Unisom (Doxylamine)
- Vitamin B6 10-25 mg, 3-4x/ day

## For yeast infection

- Gyne-lotrimin 7 day (Clotrimazole)
- Monistat 7 day (Miconazole)

## For cough/ cold/ congestion

- Benadryl (Diphenhydramine)
- Claritin (Loratadine)
- Cough drops
- Cepacol
- Mucinex (Guaifenesin)
- Mucinex D (Guaifenesin + Pseudoephedrine)
- Nasal saline spray
- Robitussin cough (Dextromethorphan)
- Delsym (Dextromethorphan)
- Robitussin DM (Dextromethorphan + Guaifenesin)
- Sudafed (Pseudoephedrine)
- Zicam
- Zyrtec (Cetirizine)

## For constipation

- Citrucel (Methylcellulose powder)
- Colace (Docusate sodium)
- Dulcolax (Bisacodyl)
- Milk of Magnesia
- Miralax (PEG)
- Senokot (Senna)
- Probiotics (Lactobacillus)

## Pain/ Fever

- Tylenol (Acetaminophen)

## For itching

- Benadryl cream
- Hydrocortisone cream

## For Hemorrhoids

- Tucks medicated pads
- Preparation H

## Other

- Aspirin 81 mg (To decrease the risk for gestational diabetes and pre-eclampsia after 12 wks)

# Nutrition during Pregnancy

## Frequently Asked Questions

### Overview

#### Why is nutrition during pregnancy important?

Eating well is one of the best things you can do during pregnancy. Good nutrition helps you handle the extra demands on your body as your pregnancy progresses. The goal is to balance getting enough nutrients to support the growth of your fetus and maintaining a healthy weight.

#### How much should I eat during pregnancy?

The popular saying is that pregnant women “eat for two,” but now we know that it’s dangerous to eat twice your usual amount of food during pregnancy. Instead of “eating for two,” think of it as eating twice as healthy.

If you are pregnant with one fetus, you need an extra 340 calories per day starting in the second trimester (and a bit more in the third trimester). That's roughly the calorie count of a glass of skim milk and half a sandwich. Women carrying twins should consume about 600 extra calories a day, and women carrying triplets should take in 900 extra calories a day.

### Key Vitamins and Minerals

#### Why should I take a prenatal vitamin?

Vitamins and minerals play important roles in all of your body functions. Eating healthy foods and taking a prenatal vitamin every day should supply all the vitamins and minerals you need during pregnancy.

#### How many prenatal vitamins should I take each day?

Take only one serving of your prenatal supplement each day. Read the bottle to see how many pills make up one daily serving. If your obstetrician–gynecologist (ob-gyn) thinks you need an extra amount of a vitamin or mineral, your ob-gyn may recommend it as a separate supplement.

## Can I take more prenatal vitamins to make up for a deficiency?

No, do not take more than the recommended amount of your prenatal vitamin per day. Some multivitamin ingredients, such as vitamin A, can cause birth defects at higher doses.

## What vitamins and minerals do I need during pregnancy?

During pregnancy you need folic acid, iron, calcium, vitamin D, choline, omega-3 fatty acids, B vitamins, and vitamin C. See the below table for recommended amounts.

### Key Vitamins and Minerals During Pregnancy

<b>Nutrient (Daily Recommended Amount)</b>	<b>Why You and Your Fetus Need It</b>	<b>Best Sources</b>
Calcium (1,300 milligrams for ages 14-18; 1,000 milligrams for ages 19-50)	Builds strong bones and teeth	Milk, cheese, yogurt, sardines, dark green leafy vegetables
Iron (27 milligrams)	Helps red blood cells deliver oxygen to your fetus	Lean red meat, poultry, fish, dried beans and peas, iron-fortified cereals, prune juice
Iodine (220 micrograms)	Essential for healthy brain development	Iodized table salt, dairy products, seafood, meat, some breads, eggs
Choline (450 milligrams)	Important for development of your fetus's brain and spinal cord	Milk, beef liver, eggs, peanuts, soy products
Vitamin A (750 micrograms for ages 14 to 18; 770 micrograms for ages 19 to 50)	Forms healthy skin and eyesight Helps with bone growth	Carrots, green leafy vegetables, sweet potatoes
Vitamin C (80 milligrams for ages 14 to 18; 85 milligrams for ages 19 to 50)	Promotes healthy gums, teeth, and bones	Citrus fruit, broccoli, tomatoes, strawberries
Vitamin D (600 international units)	Builds your fetus's bones and teeth Helps promote healthy eyesight and skin	Sunlight, fortified milk, fatty fish such as salmon and sardines
Vitamin B6 (1.9 milligrams)	Helps form red blood cells Helps body use protein, fat, and carbohydrates	Beef, liver, pork, ham, whole-grain cereals, bananas
Vitamin B12 (2.6 micrograms)	Maintains nervous system Helps form red blood cells	Meat, fish, poultry, milk (vegetarians should take a supplement)
Folic acid (600 micrograms)	Helps prevent birth defects of the brain and spine Supports the general growth and development of the fetus and placenta	Fortified cereal, enriched bread and pasta, peanuts, dark green leafy vegetables, orange juice, beans. Also, take a daily prenatal vitamin with 400 micrograms of folic acid.

## What is folic acid?

Folic acid, also known as folate, is a B vitamin that is important for pregnant women. Folic acid may help prevent major birth defects of the fetus's brain and spine called neural tube defects (NTDs).

## How much folic acid should I take?

When you are pregnant you need 600 micrograms of folic acid each day. Because it's hard to get this much folic acid from food alone, you should take a daily prenatal vitamin with at least 400 micrograms starting at least 1 month before pregnancy and during the first 12 weeks of pregnancy.

Women who have had a child with an NTD should take 4 milligrams (mg) of folic acid each day as a separate supplement at least 3 months before pregnancy and for the first 3 months of pregnancy. You and your ob-gyn or other obstetric care provider can discuss whether you need to supplement with more than 400 micrograms daily.

## Why is iron important during pregnancy?

Iron is used by your body to make the extra blood that you and your fetus need during pregnancy. Women who are not pregnant need 18 mg of iron per day. Pregnant women need more, 27 mg per day. This increased amount is found in most prenatal vitamins.

## How can I make sure I'm getting enough iron?

In addition to taking a prenatal vitamin with iron, you should eat iron-rich foods such as beans, lentils, enriched breakfast cereals, beef, turkey, liver, and shrimp. You should also eat foods that help your body absorb iron, including oranges, grapefruit, strawberries, broccoli, and peppers.

Your blood should be tested during pregnancy to check for anemia. If you have anemia, your ob-gyn may recommend extra iron supplements.

## What is calcium and what foods contain it?

Calcium is a mineral that builds your fetus's bones and teeth. Women who are age 18 or younger need 1,300 mg of calcium per day. Women who are 19 or older need 1,000 mg per day.

Milk and other dairy products, such as cheese and yogurt, are the best sources of calcium. If you have trouble digesting milk products, you can get calcium from other sources, such as broccoli, fortified foods (cereals, breads, and juices), almonds and sesame seeds, sardines or anchovies with the bones, and dark green leafy vegetables. You can also get calcium from calcium supplements.

## What is vitamin D and what foods contain it?

Vitamin D works with calcium to help the fetus's bones and teeth develop. Vitamin D is also essential for healthy skin and eyesight. All women, pregnant or not, need 600 international units of vitamin D a day.

Good sources of vitamin D include fortified milk and breakfast cereal, fatty fish (salmon and mackerel), fish liver oils, and egg yolks.

### How will I know if I'm getting enough vitamin D?

Many people do not get enough vitamin D. If your ob-gyn thinks you may have low levels of vitamin D, a test can be done to check the level in your blood. If it is below normal, you may need to take a vitamin D supplement.

### What is choline and what foods contain it?

Choline plays a role in your fetus's brain development. It may also help prevent some common birth defects. Experts recommend that pregnant women get 450 mg of choline each day.

Choline can be found in chicken, beef, eggs, milk, soy products, and peanuts. Although the body produces some choline on its own, it doesn't make enough to meet all your needs while you are pregnant. It's important to get choline from your diet because it is not found in most prenatal vitamins.

### What are omega-3 fatty acids and what foods contain omega-3s?

Omega-3 fatty acids are a type of fat found naturally in many kinds of fish. Omega-3s may be important for brain development before and after birth.

Flaxseed (ground or as oil) is also a good source of omega-3s. Other sources of omega-3s include broccoli, cantaloupe, kidney beans, spinach, cauliflower, and walnuts.

### How much fish should I eat to get the omega-3 fatty acids that I need?

Eat at least two servings of fish or shellfish per week before getting pregnant, while pregnant, and while breastfeeding. A serving of fish is 8 to 12 ounces (oz).

### Which types of fish should I avoid?

Some types of fish have higher levels of mercury than others. Mercury is a metal that has been linked to birth defects. Do not eat bigeye tuna, king mackerel, marlin, orange roughy, shark, swordfish, or tilefish. Limit white (albacore) tuna to only 6 oz a week. Also check advisories about fish caught in local waters.

### What are B vitamins and what foods contain them?

B vitamins, including B1, B2, B6, B9, and B12, are key nutrients during pregnancy. These vitamins

- give you energy
- supply energy for your fetus's development
- promote good vision

- help build the placenta

Your prenatal vitamin should have the right amount of B vitamins that you need each day. Eating foods high in B vitamins is a good idea too, including liver, pork, chicken, bananas, beans, and whole-grain cereals and breads.

## What is vitamin C and what foods contain it?

Vitamin C is important for a healthy immune system. It also helps build strong bones and muscles. During pregnancy, you should get at least 85 mg of vitamin C each day if you are older than 19, and 80 mg if you are younger than 19.

You can get the right amount of vitamin C in your daily prenatal vitamin, and also from citrus fruits and juices, strawberries, broccoli, and tomatoes.

## How can I get enough water during pregnancy?

Drink throughout the day, not just when you are thirsty. Aim for 8 to 12 cups of water a day during pregnancy.

## Planning Healthy Meals

### How can I plan healthy meals during pregnancy?

There are many tools that can help you plan healthy meals. One useful tool is the MyPlate food-planning guide from the U.S. Department of Agriculture. The MyPlate website, [www.myplate.gov](http://www.myplate.gov), can help you learn how to make healthy food choices at every meal.

The MyPlate website offers a MyPlate Plan, which shows how much to eat based on how many calories you need each day. The MyPlate Plan is personalized based on your

- height
- prepregnancy weight
- physical activity level

The MyPlate Plan can help you learn about choosing foods from each food group to get the vitamins and minerals you need during pregnancy. The MyPlate Plan can also help you limit calories from added sugars and saturated fats.

### What are the five food groups?

Grains, Fruits, Vegetables, Protein foods, Dairy foods.

### What are grains?

Bread, pasta, oatmeal, cereal, and tortillas are all grains. Whole grains are those that haven't been processed and include the whole grain kernel. Oats, barley, quinoa, brown rice, and bulgur are all

whole grains, as are products made with those grains. Look for the words “whole grain” on the product label. When you plan meals, make half of your grain servings whole grains.

### **What types of fruit should I eat?**

You can eat fresh, canned, frozen, or dried fruit. Juice that is 100 percent fruit juice counts in the fruit category, but it is best to eat mostly whole fruit instead of juice. Make half your plate fruit and vegetables during mealtimes.

### **What types of vegetables should I eat?**

You can eat raw, canned, frozen, or dried vegetables or drink 100 percent vegetable juice. Use dark leafy greens to make salads. Make half your plate fruit and vegetables during mealtimes.

### **What are protein foods?**

Meat, poultry, seafood, beans and peas, eggs, processed soy products, nuts, and seeds all contain protein. Eat a variety of protein each day.

### **What are dairy foods?**

Milk and milk products, such as cheese, yogurt, and ice cream, make up the dairy group. Make sure any dairy foods you eat are pasteurized. Choose fat-free or low-fat (1 percent) varieties.

### **Why are oils and fats important?**

Oils and fats are another part of healthy eating. Although they are not a food group, they do give you important nutrients. During pregnancy, the fats that you eat provide energy and help build the placenta and many fetal organs.

### **What are healthy sources of oils and fats?**

Oils in food come mainly from plant sources, such as olive oil, nut oils, and grapeseed oil. They can also be found in certain foods, such as some fish, avocados, nuts, and olives.

Most of the fats and oils in your diet should come from plant sources. Limit solid fats, such as those from animal sources. Solid fats can also be found in processed foods.

## **Weight Gain**

### **How much weight should I gain during pregnancy?**

Weight gain depends on your health and your body mass index (BMI) before you were pregnant. If you were underweight before pregnancy, you should gain more weight than a woman who had a normal weight before pregnancy. If you were overweight or obese before pregnancy, you should gain less weight.

The amount of weight gain differs by trimester:

- During your first 12 weeks of pregnancy—the first trimester—you might gain only 1 to 5 pounds or none at all.
- If you were a healthy weight before pregnancy, you should gain a half-pound to 1 pound per week in your second and third trimesters.

See the below table for recommended weight gain during pregnancy.

### Weight Gain During Pregnancy

<b>Body Mass Index (BMI) Before Pregnancy</b>	<b>Rate of Weight Gain in the Second and Third Trimesters* (Pounds Per Week)</b>	<b>Recommended Total Weight Gain With a Single Fetus (in Pounds)</b>	<b>Recommended Total Weight Gain With Twins (in Pounds)</b>
Less than 18.5 (underweight)	1.0 to 1.3	28 to 40	Not known
18.5 to 24.9 (normal weight)	0.8 to 1.0	25 to 35	37 to 54
25.0 to 29.9 (overweight)	0.5 to 0.7	15 to 25	31 to 50
30.0 and above (obese)	0.4 to 0.6	11 to 20	25 to 42

\*Assumes a first-trimester weight gain between 1.1 and 4.4 pounds

Source: Institute of Medicine and National Research Council. 2009. Weight Gain During Pregnancy: Reexamining the Guidelines. Washington, DC: The National Academies Press.

### How many extra calories should I eat?

During the first trimester with one fetus, usually no extra calories are needed. In the second trimester, you will need an extra 340 calories per day, and in the third trimester, about 450 extra calories a day. To get the extra calories during the day, have healthy snacks on hand, such as nuts, yogurt, and fresh fruit.

### How can being overweight or obese cause problems during pregnancy?

Excess weight during pregnancy is associated with several pregnancy and childbirth complications, including:

- high blood pressure
- preeclampsia
- preterm birth
- gestational diabetes

Obesity during pregnancy also increases the risk of:

- a larger than normal fetus (macrosomia)
- birth injury
- cesarean birth
- birth defects, especially NTDs

## What if I am obese or overweight?

You and your ob-gyn should work together to develop a nutrition and exercise plan. If you are gaining less than what the guidelines suggest, and if your fetus is growing well, gaining less than the recommended guidelines can have benefits. If your fetus is not growing well, changes may need to be made to your diet and exercise plan.

## Resources and Glossary

### MyPlate

### Glossary

**Anemia:** Abnormally low levels of red blood cells in the bloodstream. Most cases are caused by iron deficiency (lack of iron).

**Birth Defects:** Physical problems that are present at birth.

**Body Mass Index:** A number calculated from height and weight. BMI is used to determine whether a person is underweight, normal weight, overweight, or obese.

**Calories:** Units of heat used to express the fuel or energy value of food.

**Cesarean Birth:** Birth of a fetus from the uterus through an incision (cut) made in the woman's abdomen.

**Complications:** Diseases or conditions that happen as a result of another disease or condition. An example is pneumonia that occurs as a result of the flu. A complication also can occur as a result of a condition, such as pregnancy. An example of a pregnancy complication is preterm labor.

**Fetus:** The stage of human development beyond 8 completed weeks after fertilization.

**Folic Acid:** A vitamin that reduces the risk of certain birth defects when taken before and during pregnancy.

**Gestational Diabetes:** Diabetes that starts during pregnancy.

**High Blood Pressure:** Blood pressure above the normal level. Also called hypertension.

**Macrosomia:** A condition in which a fetus grows more than expected, often weighing more than 8 pounds and 13 ounces (4,000 grams).

**Neural Tube Defects:** Birth defects that result from a problem in development of the brain, spinal cord, or their coverings.

**Obstetrician–Gynecologist (Ob-Gyn):** A doctor with special training and education in women's health.

**Oxygen:** An element that we breathe in to sustain life.

**Placenta:** An organ that provides nutrients to and takes waste away from the fetus.

**Preeclampsia:** A disorder that can occur during pregnancy or after childbirth in which there is high blood pressure and other signs of organ injury. These signs include an abnormal amount of protein in the urine, a low number of platelets, abnormal kidney or liver function, pain over the upper abdomen, fluid in the lungs, or a severe headache or changes in vision.

**Preterm:** Less than 37 weeks of pregnancy.

**Trimester:** A 3-month time in pregnancy. It can be first, second, or third.
