

Co., Ltd. established in 2005, is one of the leading manufacturers of wooden outdoor products located in China. It's 140km away from port. owns 39500 m² of plant area, 1467 hectares of high-quality forest and 498 employees , including 28 professionals on the R&D and QC team.

There are five product series: kids' playset , gardening ,outdoor furniture, indoor furniture and pet house, many of which have been sold worldwide, including Europe, North America, Australia and also domestic market . The annual capacity is 840 containers while also importing materials from North America and Europe.

The mission of our professional R&D team is "to exploit the everlasting market demand" and develop new products continuously. As of current, we have 164 utility model patents that have been accepted. Our annual plan is to promote 50 new products.

Quality is essential. Whereas quantity is simply a number, quality is much more complex. Quality Control will strictly control the quality according to international standards, the customer's requirements, and third authority inspection parties. It is worth mentioning that has a high reputation in timely delivery based on our coordination and cooperation among various departments.

Certificate
FSC and PEFC;
BSCI, FCCA and ISO9001.

We will provide you high quality and best service!

Hemlock

Hemlock

Color is light yellow, pink or reddish brown, high strength softwood tree. Tree rings are clear, transition between early wood and late wood is subtle, wood texture is straight and even, wood is moderate to fine. Due shade tolerant, hemlock is self-snags during the growth process, which makes hemlock easy to produce a large number of non-defective wood. The hemlock is stable after air drying or kiln drying. It will become hard gradually in the process of drying and aging, so it has excellent wear resistance during the whole life. Hemlock processing performance is excellent, easy to carry out mechanical processing. Because the wood is hard and the texture is straight, it is easy to plane and does not crack. Hemlock has excellent bite force on nails and screws. Hemlock wood has a smooth, non-resinous surface and can absorb different paints and colorants.

Cypress

Cypress

Because of outstanding quality, cypress has always been highly valued. Its unique and uniform yellow is highly appreciated. The texture is very fine and very straight. And it gives out a strong and pleasant aroma after cutting.

Cypress is the one of the long lasting trees in the world; therefore the tree has a very good strength, wear resistance and impact resistance.

It is easy to dry, dimensional stability, little shrinkage, easy processing into a smooth surface, grip wrapped around the nails and screws without cracking.

Due to appearance, durability and easy processing characteristics make it suitable for the production of a variety of wood products which pay attention to product quality, appearance, durability and stability.

Strength, stability, uniform color and fine surface also make it very suitable for making windows and doors, decorative panels and custom wood products in residential and commercial buildings. Craftsmen often used cypress for special construction projects, such as temples and craft sculpture. Cypress species is relatively rare with a noble sense.

With smooth and wear resistant, weather resistant and long service period characteristics, cypress is used to make the seats for outdoor sports facilities.

Eucalyptus

Eucalyptus

The heartwood can vary in color from pale pink to medium pink. The sapwood, which is not always clearly differentiated from the heartwood, is typically paler. It has a uniform but moderately coarse-textured grain, which is usually straight or slightly interlocked. Eucalyptus is a top quality solid wood product ideally suited for high end applications in furniture, cabinets, moldings, doors and windows, etc. Eucalyptus offers an ecological alternative to many tropical hardwoods.

Versatile and strong, this beautiful hardwood is 100% pure FSC-certified.

Eucalyptus is of moderate hardness. It machines and turns well to a good smooth finish, and it takes fixings with no difficulty. It glues satisfactorily and readily accepts paint, stain and polish.

Durability

Eucalyptus is Durability Class 3-moderately durable (e.g. windows and doors up to 30 years without treatment-test performed by TRADA Institute UK-October 2009)

The heartwood is resistant to decay when exposed to the weather above ground.

Red Cedar

Red Cedar

Red Cedar slow growth and its naturally occurring fungicidal compounds in the wood called thujaplicins produce the wood's fine grain, decay resistance and rich coloring that is its trademark. Another extractive present in the wood, thujic acid, helps make the species resistant to insect attack. Light in weight, and with a soft texture, red cedar is an extremely dimensionally stable wood that seasons.

Easily and quickly with low shrinkage factor.

Freedom from pitch and resin gives red cedar excellent finishing properties. Because of its dimensional stability, it is an ideal base for a variety of finishes, either full bodied paints or stains, or semi-transparent products that reveal the wood's warm color and texture. It has good gluing qualities and nailing properties. Beauty and durability, the hallmarks of red cedar, have made it one of the world's most widely specified woods for many aspects of residential design. Red Cedar tends to be used for applications where dimensional stability, natural durability and fine appearance is required.

Red cedar is well suited for decks and fencing. Light weight and stable, it is easy to work with and weathers the elements naturally. Its excellent insulating qualities are an added advantage to its use as an exterior siding, an application where it is both practical and visually pleasing.

As an interior panelling, red cedar offers tonal and textural qualities which add a natural character to any area.
